nothing so much as tearing off any delusions in which they might be enveloped. Arriving at Missolonghi a few days after Byron's death, he went to the house in which the body lay. 'No one,' he says, 'was in the house but Fletcher, of which I was glad. As if he knew my wishes, he led me up a narrow stair into a small room, with nothing in it but a coffin standing on trestles. No word was spoken by either of us; he withdrew the black pall and the white shroud, and there lay the embalmed body of the pilgrim—more beautiful in death than in life. The contraction of the muscles and skin had effaced every line that time or passion had ever traced on it; few marble busts could have matched its stainless white, the harmony of its proportions, and perfect finish; yet he had been dissatisfied with that body, and longed to cast its slough. How often I had heard him curse it! He was jealous of the genius of Shakespeare—that might well be; but where had he seen the face or form worthy to excite his envy? I asked Fletcher to bring me a glass of water. On his leaving the room, to confirm or remove my doubts as to the cause of his lameness, I uncovered the pilgrim's feet, and was answered—the great mystery was solved. Both his feet were clubbed, and his legs withered to the knee—the form and features of an Apollo, with the feet and legs of a satyr.' This is exaggerated. Byron was neither so classically moulded nor so deformed—that is, no more like an Apollo than he was like Theseus. He was a good, handsome Englishman, with a face illumined by genius, full of emotion, and all the varying phenomena of intellect. When Fletcher returned, he drew the shroud and pall carefully over the feet of his master's corpse; he was very nervous, and trembled as he did so.

After carefully reading these *Recollections*, what is the impression left upon the mind? Is it favourable to any one? Do we rise from the perusal with a better idea of the writer, or of the individuals written about? This, however, it may be said, is not the point—the question ought to be, Is our conception of Byron or Shelley rendered truer or more complete? We think not. Some slight information may be gleaned about certain habits of both poets; but the general effect seems to be to unsettle and mystify the mind. The scenes over which the narrative carries us are often vividly depicted in parts, with off-hand dashes here and there; but even the *Mosses*, with the frowning grandeur of its wild coast, fails to betray Mr Trelawny into drawing a regular picture. He passes through the most extraordinary places with the indifference of a muleteer; but his fancy wakes up now and then, and casts a startling and brilliant light upon some gray crag or lonely glen. It is much the same with his characters. A few of their points are shown us, but in a manner too unconnected to render the exhibition of much use. The only value of such books is, that they may by chance awaken the curiosity of some readers, and induce them to seek for more satisfactory information than the writer himself supplies.

THE QUINEA-PIGS.

When 'term' begins in London, everybody, especially everybody who dwells within reasonable limits of the inns of court, is immediately made aware of it. There are a number of phenomenal indications which peep out of lone entries, start up in third-rate shop-windows, or cluster round wine-vaults in paved courts, or promenade the streets with lordly stride—all of which proclaim that interesting fact even to the most careless observer. Not only do the retired and mouldy retreats, where the lawyers affect to resort, pucker up their brows and wake out of their long sleep—not only does Pump Court once more resound with

the echoes of hasty feet, and Gray's, Lincoln's, and Clement's put on the aspect of *bona-fide* thoroughfares, with clients rushing in and out, and backwards and forwards all day long—but Chancery Lane, with all its fringe of flagged closes and bottomless alleys, Cook's Court and Carey Street, with their tons of brief-paper and red tape—the remotest purlieus of the Temple, and the loftiest garrets of the quill-driving hacks, are all galvanised into a state of sudden activity, which knows nor pause nor subsidence day or night.

Now it is that the costume of wigs, and gowns, and violet-coloured bags comes into fashion, and crops out suddenly in wonderful profusion in the region of Temple Bar. Now the white-aproned messengers are at their wits' end, and flurried with the harvest of sixpences which rain a silver shower, run hither and thither laden with missives verbal and written, and only too happy if they escape the perpetration of some fatal exchange in the delivery. Now is Mrs Jones, the laundress, plagued out of her life with the everlasting tintinnabulation of twenty bells at once, and reduced to the necessity of administering impartial justice by answering none of them. Now is little Twister, the barber of Poppin's Corner, who has just achieved his first professional wig, praying devoutly that his patron, Mr Augustus Grinder, who ate his way to the bar with such exemplary fervour, may get his virgin brief, in which case he has pledged himself to purchase Twister's virgin wig. Now are the law-stationers up to their eyes in business, or buried in it over head and ears; now do all the hangers-on who yield to a magnetic attraction in the flat of judge and jury, crowd to the judicial arena; and now does the Guinea-pig, starting from his sleep, make his appearance on the field of action, and address himself to the mission of his existence.

'And, pray, who is the guinea-pig?'

The guinea-pig, my friend, is not the animal mentioned under that name by Buffon, neither did Goldsmith put him down in his *Animated Nature*, though the observant and genial Goldy, it is more than probable, knew the species well enough. Who is the guinea-pig, do you ask? Favour us with your company for a few moments, and we will discover for you this choice specimen of natural history.

Here we are, then, at Westminster Hall. That door to the left, flanked by that branching maypole rigged with blind gas-burners, is the members' entrance to the House of Commons; and this one opposite, to the right, is the entrance to the Court of Queen's Bench. In the lobby within sits an old woman dispensing apples and oranges, to exhausted witnesses and feverish clients, at a penny apiece; and in the lofty square apartment which serves as the court beyond, Lord Campbell is sitting at this moment dispensing justice at not quite so cheap a rate. His lordship, as you see, has a couple of brother-judges with him on the elevated dais, and all three look mightily grand in their huge long-tailed wigs, resting like epaulets on their shoulders, their crimson robes of office and their broad ermine trimmings. The court is crowded in every part, and very still—not a sound is heard but the deep double bass of Counsellor Bulbous, who has been on his legs this hour, and is likely to buzz on for two hours longer—being engaged on the famous suit of *Slinker versus Slime*, touching the repairs of Mudbury Dyke. The buzz-uzz-oozle-woozle-muffle of the worthy counsellor, like the song of the blue-bottle after dinner on a summer's afternoon, has produced a soporific influence traceable on the whole two hundred or so of auditors who represent the British public. There he stands in that oblong pit below the dais, which, dotted as it is in every part with round white wigs all motionless, looks

uncommonly like an oblong bed of cauliflowers planted in rows and in full blow. There he bubbles forth his interminable plea—the judges resigning themselves to fate in their easy-chairs, with a patience and fortitude only to be accounted for by reference to those quarterly thousands paid out of Her Majesty's exchequer, which compensate the weariness of office. His learned brethren doze on their benches—the newspaper reporters doze in their boxes—the casual spectators who have crept in to slake their curiosity, find themselves yawning before they know what they are about, and sneak out again for a refresher in the open air. Numbers, you remark, come in to see and hear; some take their seats on the rising benches open to the public, some merely lounge against the wall—but very few of them stand it, or sit it, many minutes before they are off again out of reach of that somnolent voice.

'Not so,' say you; 'there are some forty or fifty people on those upper benches, who, so far from moving, seem to be regular fixtures, and never move at all.'

Ah, my friend, those are the guinea-pigs—those are the identical natural curiosities we have come in search of, and you cannot do better than to note them well. During the whole of the period of term those upper benches are the habitat of the judicial guinea-pig. Mark how still, stolid, and statue-like they sit, how persistently they do not listen to anything that goes forward, and how thoroughly they ignore each other. Gregarious as these strange creatures are, it is an unquestionable fact that they are never known to fraternise in the slightest degree. Indeed, it is rumoured that they hate one another like grim death, and that the greatest windfall that could happen to any one of them would be to see a dozen or two of his comrades knocked on the head. An ill-natured story is current, to the effect that when that old gentleman yonder in the corner—he with the frayed black stock and iron-moulded linen—was seized with a fit of paralysis, and fell to the ground, not one of them could be got to move a finger in his aid, and the police had to beatir themselves to get him out; and that when he came back on the following term, all the welcome he met with was a growl of disappointment that the attack had not carried him off. You will observe that they are all distinguished by two things—a peculiar seediness of raiment which makes convulsive efforts to assume respectability, and a still more peculiar cast of countenance, which it is far easier to recognise when once seen than it is to describe with accuracy.

Those ranks of silent, self-concentered statues, then, are the guinea-pigs; and if you ask what they are doing there, the answer is—they are waiting for their guinea. Whenever the court sits—no matter whether at Westminster or at the Guildhall—the guinea-pigs sit along with it—and they will inevitably make their appearance with all the regularity and far greater punctuality than either judge or advocate. For their description, we can give it only in part, for there is a mystery about them which the keenest observer has not been able to penetrate entirely, and of all bipeds they are reckoned the most close and taciturn, almost equalling in these qualities their four-footed and tailless prototypes. They are, however—for so they must be to qualify them for the post they seek to adorn—housekeepers and rate-payers; they have contrived, by some means, to get their names enrolled on the list of jurymen to the Queen's Bench Court, and to keep them there; and the grand business, the only business of their lives during the continuance of term, is to shift themselves, by hook or by crook, by urgent solicitation in the right quarter, or by patient waiting, into the jury-box, in order that they may be entitled to the guinea with

which the liberality of the court will reward their—labour, we were going to say, but that term would be a misnomer—their inertia.

But what is that? As sure as fate, Bulbous has come to a dead-lock: his lordship, whom we all supposed to be dozing, has pulled him up on a point of law, and the interminable plea has come to an unexpected halt. Lo! the cauliflowers resolve themselves into a committee of legal gentlemen—half the wigs turn their facial side this way—the white heads are all bobbing and whispering together—there is the hasty scratching of quills upon foolscap—and while Counsellor Bulbous is vigorously ramming documents into his bag, with the air of a check-mated chess-player, the jury-box is suddenly vacated, and the deputy clerk of the court begins bawling over the names of the list of jurymen, in order to swear in a new jury for the immediate trial of a new cause.

Look at the guinea-pigs now—they are no longer the still, stolid, unimpressible creatures you took them for. See how every man of them bristles up—how the eyes twinkle, and the lips part, and the neck cranes forward in the attitude of attention, as name after name is called.

'John Brown!' bawls the clerk. 'Here!' and John Brown, buttoning his seedy overcoat, pulling up his collar, and unearthing from his threadbare cuffs a clean pair of wristbands, rises with a self-satisfied smirk, and glides into the jury-box as silently as the guinea, by and by, will glide into his pocket.

'Thomas Robinson!' 'Here!' and Robinson, with an air of dignified complacency, follows in the wake of Brown.

'James Jones!' bawls the clerk. There is a dead silence—no answering 'Here!' and in a few moments the clerk shouts 'James Jones!' a second time with redoubled emphasis. Still there is no reply; James Jones is evidently not forthcoming, though the pause is prolonged before the third time of asking. The third appeal produces the same non-result as to Mr James Jones; but now a little man who has been wriggling on his seat and fussily rising and sitting down again for the last few minutes, breaks the silence.

'Cornelius Jones is here,' he calls out suggestively to the clerk.

This unwarrantable interpolation on the part of Mr Cornelius acts like a firebrand among the whole herd of guinea-pigs; and in defiance of the sanctity of the place, their resentment bursts forth in a series of grunts and sneers and bitter objurgations launched at the head of the offender with a fierceness all the more fierce that it has to be uttered *sub voce* and out of ear-shot of the bench.

'It won't do, Corny,' growls one.

'Wait your turn, snatchbody!' hisses a second.

'Betsy Prig!' snarls a third.

And furious eyes are turned on the delinquent, who, being accustomed to that sort of fire, does not wince under it, but preserves an enviable equanimity until the storm has blown over.

By the time the whole twenty-four jurymen are collected, the ranks of the guinea-pigs are considerably thinned. There is an evident expression of disappointment in some of the remaining faces, but that is tempered with some satisfaction too, because, though they have not yet won their prospective prize, they are nearer to the winning-post by four-and-twenty names, and feel that they are at no great distance from the inevitable one pound one.

But the question, 'Who is the guinea-pig?' is not answered yet, and, in truth, it is not one of easy solution. There are various theories afloat touching the physiology of the creature. Speculators on this abstruse subject have likened his tribe to a shower of

frogs, coming no man knows whence, and departing no man knows whither—or to those curious travellers the land-crabs of the West Indies, which overrun certain territories at certain seasons, and then suddenly and miraculously vanish away. What is agreed upon on all hands appears to be the fact, that the guinea-pig is altogether an undiscoverable biped at all or any of those seasons when the law-courts are not sitting. Where he spends his long vacation, nobody seems to have even the remotest idea. The wildest conjectures are hazarded as to his modes and means of life. It is computed that at the utmost he cannot realise more than from fifteen to twenty guineas a year by hanging on to the skirts of the judges: how, then, does he get the rest of the income which constitutes him a housekeeper and a rate-payer, and a 'good man and true'?

We can hazard no reply to this question. We have heard the satirical wits of the court taunt this fraternity with questions of various kinds—as to the condition of a hypothetical mangle, for instance, or the real ownership of a paletot suspiciously glossy; but these sarcasms point to nothing definite, and leave the real question in all its uncertainty. According to all appearances, the mission of the guinea-pig is to compass as often as he can an easy guinea—and beyond that we can declare nothing positive concerning him.

C R A G - F A S T.

We have lived so long, my brother Frank and I, in the grand hill-country of the north, that its great gray giants have long ceased to be held by us in awe; our reverence for them is not one whit diminished, but our fear is fled. Their crowns, hidden in cloud, their huge fern-covered shoulders, their mighty girdles of melancholy pine, are our glory still, but are no more threatening than their slopes of pasture-land, and woods that stray down to the margin of the lakes. Even in winter-time, unless the hill-fog be hanging thickly, or the blinding snow be whirling, we should not hesitate to cross the highest gap in Westmoreland, or find our way to Keswick by the Fells. From our nearest mountain-top we can see the road to it, and track it almost all the way, bridging the rivers and fording the rills, and winding round mere after mere, until, a thin white streak, it climbs the furthest ridge, and comes, we know, unawares on the little town. As the crow flies, we are not ten miles from it; but a man cannot reach it in eighteen miles, nor a horse in twenty-eight. Many a time, since Harry left us, have Frank and I gone thither and returned in the same day, partly to get little luxuries that are not in our far-away mountain home; partly from the exceeding beauty of the way itself; and partly, it may be, to keep his memory green who is no longer with us.

A score of summers have brought bird and butterfly into our happy valley, and set the bee roaming on the hills since last our Harry took that walk with us—but we do not forget it. The fair June morn, the quarter which the gentle breeze blew from, the coombs wherein the shadows of the clouds lay—we remember all. Harry was beautiful, which we are far from being, kind and accomplished almost as a girl; but he was weak in health, and had to battle for dear life through every winter. Supple of limb when well, and strong in spirit whether well or ill, he wanted care, and we were not good nurses. We did not lack in love, but in 'the reason firm, the temperate will,' which have been so often found of late in the gentler sex, soothing, controlling, saving so many of their soldier brethren. What our poor brother fixed

his wishes on, we had no heart to refuse. He was, we felt, and everybody but himself knew well, but for a little while on earth, and not, therefore, to be denied a pleasure lightly. He would walk to Keswick—that he had determined on—the next time Fred and Frank went, and designing there to sleep that night, we suffered him one day to go with us. We chose our time during a series of unbroken fine weather; no rain had fallen for weeks throughout the district—'fair' said the shepherd's weather-glass, and 'fair' said Michael Gwain, the shepherd, when we started that morning, we two with knapsacks, and Harry with his alpenstock, up the bed of the empty beck. It had been rifled of its silver treasure by the sun, and the crags stood out bare and smooth where the waters had roamed at will. Silence had usurped the seat of song; and the stones that had held their summits highest above the strife, like many a human head that proudly lifts itself above the battle of the world, displayed their stubborn breasts, riven and worn enough. Two deep-cut channels alone marked the spot where the twin torrents had lately met; and a little tree that overhung it, and was wont to be kept green by the rainbow-tinted spray, was dying fast; the mighty stepping-stones, fit each to cover a hero's grave, were useless, and felt no footsteps. It was dry even beneath the little bridge where the trout were used to make their ceaseless circles in the pool; the dead fish were lying on either side in their beautiful armour, never more to slumber in the brown depths, or to wag a lazy fin upon the surface; they had trusted to have escaped the evil eye of the sun. One by one, the sheep wandered up and down with piteous bleat, and we ourselves, with head inclined and hollowed hand, could find no drop of water.

Our progress up the broken way was slow, and on the steep path beside it the parching earth was hot beneath our feet; and the fern, the moss-knots, and the heather, crumbled into dust within our grasp. One of us has reached the summit; that shout of triumph carried over the hills above proclaims it, and that one is Harry; because he had less breath to lose than any of us, he must of course needs scramble up the first, and holla. And indeed there is something glorifying in having gained the top of a high hill; when the breeze of the mountain first blows on a man's brow, one may generally know it by other signs than a mere ruddy cheek; the voice is more still than usual, but what beauty or wisdom it has to speak we seem to get there above all places; the freshness that falls on the senses sheds dew on the heart, and the thoughts that lie deepest spring up and blossom into speech; the world's cares and crosses seem all left below, and fade away far in the distance, while beneath us is spread the glory of the earth. When to us the town lies in silence, and the sail turns not on the hill—when the spade, the pick, and the clanging factory send up no murmur—when the glancing river moves not on, and the oar of the sailor is dumb, and thronged city and desolate sea alike give forth no sound: from the Isle of Man in the far westward, and along the open sparkling sea, our eyes came back to the dear valley at our feet, the tranquil lake with its green-wooded islets, wherein another heaven seemed to smile, another sun to shine; the rich low meadows round it sprinkled thickly with cattle, the farms of dazzling whiteness, the low-roofed cottages of unmortared stone, and the vane of the gray old church beaming above the slumbersome yews like fire. All men may not be moved so, but I think it is thus with most of us who think; and it was so certainly on that day with our dear Harry: never was he so animated, enthusiastic, eloquent as then; we might have almost known, had we been long enough in the old north country to imbibe its creeds, that mischief was

therefore in store for him. On we went, mile after mile, over the dry morasses, where the streams no longer pushed their sluggish way through the black mould, and the tufts of heath were withering. We lay down often under some huge crag, from which the goat fled, scared, or the rock-raven slowly oared herself away on mighty lustrous wings—for the heat had become intense—to rest. Panting on the short brown grass, with our faces heavenward, was as good as lotus-eating; the warmth of noon and the quiet of night reigned jointly upon these lofty heights, where the murmur of the bee alone seemed to threaten the silence.

Here we passed strange-shaped crags, which once, the legend went, were mortal men tranced by wizard spell; here, rock-rent chasms, where the fiend was said to dwell in winter-time; and here we came upon some desolate tarn, needing not romance to heighten its lonely terrors—where Solitude seemed sister to Despair. Meanwhile, the faint air had no breath save that which came in fitful feverish gasps, and died away; the blue sky became islanded above us by a huge black cloud, and our thirst grew insupportable. After a rest somewhat longer than usual, we caught the glimmer of a falling stream, some half-mile off, but separated from us by uneven and rugged ground. And 'Who drinks first?' exclaimed Harry; and 'I,' and 'I,' we answered, and each took his own way with a cheer, and started at racing speed for the welcome gill.

By this time the last wandering cloud had joined the threatening mass that hung swollen and dark above us, like an impersonation of wrath; and one instant the sunlight gleamed over the landscape, and the next, the shadow overcast it, as fever flushes a sick man's brow. Mountain-top could not be discerned from cloud, and the blackness of night was gathering, when on a sudden the heaven burst into flame, and the earth glared and reddened to meet it. The pent-up thunder broke forth at the same instant, and rolled out again and again before the first echoes had died away upon the hills. A few big drops fell on my forehead, and then a living wall of rain moved swiftly against me. It fairly beat my breath out, and I could hardly raise my eyes to see the glory of the tempest, the sheet after sheet of lightning which seemed to wrap the dead earth round, while the thunder hymned its terrible requiem.

Faint, weary, and wet as I was, a great joy seemed to depart when the storm ceased, which it did almost at once. Never had I seen Dame Nature in a more awful mood; scarce ever, too, under a more lovely aspect than when the sun smote through the cloud-rack, throwing broad veils of silver over the green hillsides, and setting great crowns of pearls upon their heads; intertwining the hair of the pine-woods with strings of diamonds, and awakening a thousand becks which ran straight to the valleys in song. Frank was already at the goal, and welcomed me with shouts of triumph. He had taken across the marsh as I had done, but by a securer track. Harry, who had chosen the outer edge of the table-land, along the cliffs, had not yet come. We waited for some time impatiently, for the afternoon was by this time far advanced; and when we went back to seek for him, it was with beating hearts. Neither whispered to the other his secret fear; but we read it plainly enough in each other's eyes. What if that glad laugh-music should be never heard again? if those noble eyes should be glazed in death, and the beautiful face be marred by those cruel cliffs? and with the thought arose the look of his fond mother in the hour when we should bring her lifeless darling home! Not till we had peered down every cliff and gill, and searched over the treacherous bog in vain, did Frank, with a face I shall never quite forget, approach the verge of the precipice. If our Harry had fallen there,

indeed all hope was over. But no; thank God, there was no terrible thing in that green valley—no one dread spot, such as I once have seen, whereon the eye is riveted at once—a knot of clothes, with the evil birds clanging around it. We took the same perilous path which the lost boy had taken, where the height above and the depth below were a burden to our brain, and presently we found the narrow footway broken down before us. It must have been a daring foot that would trust itself to leap to the other side, and but a slight form whose weight could have there alighted in safety. A few feet further on, the goat-track—for it was nothing more—was resumed, and rounded, out of our sight, an enormous rock. Frank was foremost, and leaped the chasm without an instant's thought. No courage, no self-sacrifice, could have induced any man to do so who had hesitated for a moment. The ground gave way with him, and he fell his whole length down, still clinging by his hands, however, to the firmer part. Agile and wary as a panther, he had done his best to guard against this danger by coming down on all-fours. I hid my eyes in terror as he clung spasmodically for a few seconds, and collected all his strength for a spring upwards; and when I looked again, he was in comparative safety. There was an impassable barrier of some eighteen feet of sheer precipice between him and me; he rounded the point before him, and a cry of gladness assured me that he had at least found Harry alive. I clambered back again with difficulty, to see whether I could get down to them from above, but it was not to be attempted. The great rock jutted out right over them, and there was no pathway round it from the other side at all. Whether the track had ever been continued further, I could not tell, but it now led clearly into a complete *cul de sac*, from which there was no escape unless by wings.

To be starved to death, or to be dashed down the steep by the first wind, seemed to be the inevitable fate of my poor brothers. Frank's voice came up from the abyss, and somewhat calmed me. 'Harry has fainted with terror,' he said; 'I have no doubt his head failed him at this spot. We cannot round the rock again from hence, but there is room enough to stand, and even to sit here, for both of us. Do you, Fred, go down to Borrowdale at once, before it gets dark, and bring up with you at daylight half-a-dozen strong men, and all the sheep-ropes you can get together; and pray Heaven send us a calm night, and that our Harry may be yet preserved to us.'

With a heart-felt injunction to the brave fellow to be of good courage, and to rely on me, I started on my errand of life and death. A frantic anxiety urged me to fly like the wind, and the most dangerous paths seemed to have lost all their terrors; but one false step, or even a slip to sprain an ankle, would be, I knew, destruction to those dear ones on the steep; so I chose my way with caution, and did not reach the valley till dusk. The greatest eagerness and sympathy were at once manifested; we collected plenty of the great cables used to extricate the crag-fast sheep, and came up with the earliest streaks of light in a great company. We could see the rock plainly enough from Borrowdale, but not the two figures crouching under it; no heath-flower bloomed above it, nor bush nor tree over its stern-seamed visage, and its wrinkled brows seemed to overhang the height with a consciousness of cruel power. It was not so easy, however, to find it from above; and having omitted to leave a man below to direct us, we wasted some precious minutes. At last we came upon the spot, and heard brother Frank cry out to us in a sad voice: 'He is alive, for he still breathes; but that is all.'

The dreadful hours passed in company with his poor charge had evidently shaken even his fortitude.

It was arranged that many smaller ropes should be taken down with the rescuer, in case they needed both to be secured to the cables. We twisted three of these last, for greater security, into one. No one opposed my natural entreaty to be permitted to be lowered first; but I saw the shepherds shaking their heads, as if they doubted my being of much service. Ten or a dozen attached themselves to the end of the tether, and I was fastened to the other, in a loop, which formed a sort of seat. A long staff was given me to keep myself off the face of the precipice, and then they let me drop downward. Lower and lower, and out of their sight, I sank slowly, but not without much motion. It required all my attention to prevent dashing against the crags: if I pushed off gently, I hit them again at once; if I gave a bold thrust, I was turned round, and flung upon them backwards. Presently, I sank below the level of the rock under which my brothers lay, and saw them. Harry was resting in the other's lap, with a corpse-like face, and quite motionless, as one to whom no hurt could happen more, and whom no power could save. Frank kept his eyes toward the stone and away from the dizzy height, and he did but glance at me for an instant, and then resumed his position.

'Get back, Frederick; get back, for the love of Heaven. Let the best shepherd amongst them take your place; and even then, I fear we two shall never see home again.' And indeed it required far more skill than I could boast of to get such a momentum as might carry me into the crevice, and still less could I have snatched a hold that might have sustained me there. I gave the signal to haul up, and told the men how matters stood.

'Was Mr Frank sufficiently master of himself, and safely situated, to draw a man in by one of the lesser ropes, if such could be thrown to him?' they asked. I answered 'No,' and it seemed greatly to disconcert them. The lightest and most agile of the party, however, volunteered to do his best, and over he went, as I had done. He required much more rope this time, in order to get a sufficient swing on it for his purpose; and those who were not engaged in holding fast could see him strike out and return to the face of the cliff quite clearly. After one or two tremendous strains, the rope suddenly slackened, and we knew that he had found foothold somewhere underneath. I don't pretend to say how it was done, for it seems to me to this day to have been a miracle of mercy: I only know that the next haul of ours brought up the shepherd with Harry, yet alive, within his arms; and again, that the fine fellow was let down, and came up with my good, brave Frank in safety. He was not much less changed to look at than his charge. Anxiety and despair had done, it seemed, the work of years with him; and we had to carry the one, and lead the other's uncertain footsteps home.

Weeks passed away before the strong man grew himself again; and for the delicate boy, a sick-room was his prison for months. The exposure to the night-air after the pelting storm, had overtaken his lungs, and his sleep was long disturbed by what he had suffered; his thin white fingers would clutch at empty air, in dreams, and his brows grow damp at the imaginary abyss that seemed to yawn beneath him. The events of that awful time indeed, haunted his memory by day and night to the last; but he never recalled them without the deepest thankfulness. 'I die amongst you all,' he said, 'safe—safe, dear Frank, at home.' And he left us before the winter came, when all beautiful things were decaying and about to perish likewise. For us, although we yield to none, by this time, in tracking the wild to his lair, and the raven to her lofty nest, we never pass that rock upon the Fells without some awe.

nor without a thought, I trust, of the great Providence which there was manifested, whereof the ungraven steep itself stands an eternal witness.

NOTES ON NATURAL HISTORY.

HAVING devoted some space in a former paper to particulars connected with my special favourite, the pretty and affectionate bullfinch, the very prince of European cage-birds, I shall here say a word about the house or dwelling usually provided for him. I think that nothing can be more wantonly cruel than the common practice of leaving the poor bird exposed to the hourly danger of being dragged through his prison bars, and perishing miserably by the fangs of the cat. I have myself adopted the mode of placing the upright wires of the cage so close that no cat's paw could possibly pass between them, at the same time allowing the cross-wires to run within about an inch and a half of each other. I would suggest, as more elegant, a slight wire-lattice covering the whole cage, and the meshes of which should not leave more than a quarter of an inch opening. This might be made of very thin brass wire, and would not look amiss; at all events, it is to be hoped that cat-proof cages made on this principle, or some other, will one day be in general use. Apropos of bullfinches, it is generally thought that they will not breed in captivity: I know of at least one instance to the contrary: a large cage, and quiet, seem all they require.

An ingenious mode of rearing birds is practised in France; at least, I have only seen it there. The young birds with the nest are placed in a small cage, and tied up near the place in which the nest itself lay. I have seen the old birds come and attend to the nursing of their offspring in this way with the utmost zeal and success. When we consider how much more skilful they are in finding the best food, and administering it in the best manner, we cannot be surprised that in this way the great losses, otherwise sure to occur, are avoided.

Pigeons are certainly graceful creatures, and interesting from many qualities they possess. Some of the peculiar kinds are striking objects, from their odd appearance or graceful symmetry; but, on the whole, I think them little worth cultivating as pets, however amusing to boys. But they have one advantage to the dweller in cities who seldom gets a peep 'at nature in her green array': they help to keep alive in his heart the soft and humanising impressions which nature alone can foster. There is something most delightful to the toil-worn mechanic who 'plies his sickly trade' in some forlorn garret, if he can see a pigeon or two of his own take wing from its window, and after wheeling gracefully about in mid-heaven, come soaring back again to their place. All the little domestic economy of the fond pair is, in such cases, an interesting study; and we seldom find pets like these, birds or flowers, in the dwellings of the spendthrift or the drunkard.

Passing to another class of animals, I come upon one I always regard with the greatest interest and curiosity: I mean the otter. In a wild state, it is one of the most fierce and savage creatures possible. Every one knows of its predatory habits, and the destruction of fish it occasions; but few are aware that, if taken very young, it may be brought up as tame as a dog, and that it is susceptible of a high degree of attachment to its master. I have it from authority on which I can implicitly rely, that an otter was thus tamed, in the west of Ireland, some years ago; and that it would descend into the waters of Lough Corrib, and return to the boat with its prey—generally a salmon—in its mouth. My informant adds,

that some English officers quartered in Galway were so delighted with its performance, that they resolved to have it at any price. The owner parted very reluctantly with his favourite, which was regularly installed at the barracks. Possibly, if his new friends had waited a sufficient time to gain his affections by kindness, all might have been well; but, anxious for sport, they took him on the water, and let him go. In a short time, the otter reappeared with a salmon in his jaws, and, as usual, swam for the boat. As he drew near, a thought seemed to strike him, and he hesitated, looked into the faces of those whom he could see, swam about a little, as if pursuing his scrutiny, and at last dived, and was seen no more! The probability is, that missing the master whom he knew, he had not sufficient acquaintance with his new possessors to care for their company. I have good information from other sources of the capacity of the otter for domestication. This capacity seems to be the distinguishing mark of certain races. I suppose it to represent organic differences in the brain and nervous system.

We have seen that the pheasant and gray partridge are incapable of domestication, while other denizens of the wood and field yield to it at once. So it appears to be among quadrupeds. The fox and wolf, although often tried, never have been truly tamed, so far as I know. They do not seem to have brain enough for it; and the silly instinct of timidity—silly, I mean, when no cause justifies it—is too strong to be got over. Yet there are some few instances of an exceptional kind, in which even the wolf has shewn affection to the person by whom he was reared. The low cunning which is displayed by these animals in such perfection, must lie in some portion of cerebral matter quite apart from those developments which distinguish the cranium of the noble and magnanimous dog. How often do we see individuals of the human species who strikingly illustrate both temperaments!

There is something very interesting in contemplating those animals which, still in a wild state, represent the origin and source of our domestic servants and companions. I do not, for my own part, believe that the dog has any more family relationship to the wolf than the pheasant has to the domestic fowl. Many qualities they have in common, no doubt; but there would seem to be some radical difference, which no time can obliterate. My belief is, that the dog has, quite apart from the wolf, his wild prototype; and that, like the South Australian dingo, some animal of the tribe was to be found in primeval Europe, from which all our varieties may have sprung.

Now that I have got upon the subject of dogs, I must restrain my garrulity, for the theme is inexhaustible. I shall content myself with alluding to the following curious instance of a voluntary association for a common purpose among them, which fell under my own observation.

When a boy, I was engaged one evening in watching to get a shot at some rabbits in an ancient park, in which were many detached burrows. I was much surprised to see two dogs—one large, and the other very small—bound over the fence, and crouching down in a hollow space, as if to avoid observation, gallop rapidly towards one of the warrens. They concealed themselves as well as they could, directing their approach by the course of an old ditch, and, when near the holes, rushing furiously forward, with the evident design of surprising some outlier. Failing in this, the small dog entered the burrow, and I could hear him barking underground, no doubt to *bold* the rabbits from their refuge, while his companion stood outside, waving his tail in the greatest excitement and watchfulness. At last the little dog returned, and the pair set off with all speed for another burrow, where the same scene was repeated. I did not see that they met with any success; but I suppose they must occasionally

have done so; and, on the whole, it has always struck me as a very curious instance in its way. It illustrates this wonderful fact, that animals can interchange ideas without language; and is the more remarkable that they were not forced into this association, as wild dogs are, by any necessity for providing, by united efforts, for their common subsistence, or for the attack upon some prey, against which the strength of one would not avail.

Among the creatures which, in a wild state, are interesting, may be mentioned the wild pig. There is something in the grisly majesty and fierce self-reliance of the full-grown boar which impresses itself on all minds. Nothing can be more savage and formidable than the countenance of this animal; and his strength and speed, when not checked in his range of ground, are wonderful. Yet he is very easily domesticated. A friend of mine supplied himself with pork and bacon for many years from a breed of pure German wild boars; and excellent they were. He had, when I first saw them, a magnificent patriarchal old fellow, of tremendous appearance, but as gentle as tame pig could be. This boar, as he had plenty of successors growing up about him, my friend bestowed upon a certain zoological garden, where he became a first-rate attraction. Whatever else was neglected, one was sure to see a crowd around the strong paling by which this fierce and dangerous wild beast was confined. 'Did you see the wild boar?' 'Oh, what a hideous monster!' was in every mouth. I remember one day creating quite a sensation of horror, by going up to the paling, calling my old acquaintance by name, and, when he came up grunting and barking to where I stood, scratching his jaws and poll to his infinite satisfaction. This reminds me of a wild-boar anecdote I had from the late Sir W. Maxwell. It would seem that a friend of his in Scotland had received from Germany a splendid boar, which soon after contrived to make his escape, by leaping a wall such as, it was presumed, no pig could possibly get over. He made his way into a park where a number of young cattle were grazing; and they, being excited by his strange appearance, gave chase at once, and ended by fairly bringing him to bay. I have always heard, on the continent, that a boar will overthrow horse and man, if they abide his onset, and I fully believe it; but so determined was the onslaught of these *stots* upon the present one, that, forming a circle around him, they contrived to trample him to death, and almost to atoms.

I have had occasion to remark before, that some of the very wildest birds and animals are capable of being tamed with facility, if taken young; while others are just the reverse.

The stag and deer tribe, generally, are instances of the former peculiarity; indeed, the boldness of tame stags renders them even dangerous. I take it for granted that they could scarcely ever be tolerated as domestic animals from their bold and fierce temper, and their tendency to use their horns when provoked. I have often seen it tried, but always with the result, that the bucks were found quite intolerable, and duly 'killed off.' An exception may be claimed for a very fine stag I once knew as forming part of the staff of a marching regiment. He went with his corps everywhere, was much admired at reviews and other such gatherings. I knew another case of a tame buck, which, in a country town, would stroll in from his master's house in the suburbs, and was constantly seen scampering back with a loaf of bread, a dried fish, or a cut of bacon in his mouth; for nothing came amiss to his appetite. He was the plague of the hucksters' shops in the vicinity, and cost, no doubt, a good sum for damages.

The same tendency to ill-temper and ferocity runs through the antelope tribe; and the ibex and chamois

are examples of it. I knew a case some years ago of a very fine chamois, in the collection of the Duke of Gotha, which became so dangerous that it had to be destroyed. By the way, I could not help feeling, when I saw these animals, what a pity it is that so little pains are taken to afford such as are kept in captivity some opportunity of shewing their native qualities. These chamois were confined in a small court, with a miniature attempt at a rocky pinnacle in the centre. Now, it would have cost but a trifle to enclose with wooden poles from the adjoining forest a space considerably larger, and within this to have erected something which might have given these interesting creatures an opportunity of displaying their wondrous agility. Perhaps this additional space and climbing-ground might have saved the life of the beautiful buck, by giving him some vent for his pent-up energies. I was told that nothing could be more formidable than the way in which he had recently attacked a calf belonging to the keeper, which unluckily came in his way. He charged the poor beast with great violence, inserting the points of his little crooked horns with great dexterity in its side, and ripping it open in such a way as to cause almost instant death.

It seems singular that we hear nothing of attempts to introduce the chamois and ibex into Scotland. Ought not the wild solitude of our Highland ranges to afford them a dwelling suitable to their nature and habits? It may indeed be doubtful whether any mountains below the level of perpetual snow would be cool enough for the ibex in summer; but the experiment would be well worth trial.

What a noble animal is the now nearly extinct ibex! It is a great mistake to suppose that the chamois disputes with him the honour of the highest mountain throne. On the contrary, of all four-footed creatures, he alone breathes the keen air of the Alpine summits; and although descending at night to feed in the lower ranges, yet his home is the bosom of the eternal glacier, stretched at length upon which he passes the summer-day, and strives to cool by its contact his heated blood.

What would one not give to see a herd of these wonderful creatures, with their huge horns recurved almost to the tail, yet skipping lightly from crag to crag, and finding a safe footing amongst the most appalling precipices! It is not surprising that the chase of the ibex has for the hunter of the Alps all the fascination of gambling. No laws, however strict, can restrain him; and although, at least in Savoy, it is penal to destroy the ibex, the work of slaughter goes on unchecked.

The race is thinning out year by year; but it has survived the period assigned by De Saussure for its extermination. When taken, it is a valuable prize. The skin is of some importance in commerce; the flesh is excellent, and the horns, if good, will fetch from L.3 to L.4 sterling.

Good horns are known by their size and the number of knobs along their edge. Each year of the animal's life, a knob is added, and they never exceed thirty, that being understood as the extreme age of the ibex. I was fortunate enough to procure, some years since, a fine pair of horns, which mark about twenty-nine years' growth; but such instances are now very rare, and will soon be unknown altogether.

All the horns brought to market are not necessarily the result of poaching. Some are generally found when the snow melts in spring, lying at the foot of the precipices over which the poor beasts have been carried by the falling avalanches. Such must have been the fate of the bearer of the horns alluded to, and awful the crash with which the patriarch came to his end, for the strong bones of the skull were split in two, although apparently almost as hard as iron, and a portion went with each horn.

I believe I am scarcely in order in speaking of the ibex among the antelopes; he is, after all, only a superior sort of goat. The chamois is allowed to hold an intermediate place, and act as a connecting-link between the goat and the true antelopes.

O C E O L A :

A ROMANCE.

CHAPTER LXI.—THE ROUTE.

THE dispatch called for instant obedience. Fortunately my horse was still under the saddle, and in less than five minutes I was upon his back, and galloping for the volunteer camp.

Among these eager warriors, the news produced a joyous excitement, expressed in a wild *hurrah*. Enthusiasm supplied the place of discipline; and, in less than half an hour, the corps was accoutred and ready for the road.

There was nothing to cause delay. The command to march was given; the bugle sounded the 'forward,' and the troop filing 'by twos,' into a long somewhat irregular line, took the route for Fort King.

I galloped home to say adieu. It was a hurried leave-taking—less happy than my last—but I rode away with more contentment, under the knowledge that my sister was now warned, and there was no longer any danger of an alliance with Arens Ringgold.

The orderly who brought the dispatch rode back with the troop. As we marched along, he communicated the camp-news, and rumours in circulation at the fort. Many events had occurred, of which we had not heard. The Indians had forsaken their towns, taking with them their wives, children, cattle, and chattels. Some of their villages they had themselves fired, leaving nothing for their pale-faced enemies to destroy. This proved a determination to engage in a general war, had other proofs of this disposition been wanting. Whither they had gone, even our spies had been unable to find out. It was supposed by some that they had moved further south, to a more distant part of the peninsula. Others alleged that they had betaken themselves to the great swamp that stretches for many leagues around the head-waters of the Amazura river, and known as the 'Cove of the Ouithlacoochee.'

This last conjecture was the more likely, though so secretly and adroitly had they managed their migration, that not a trace of the movement could be detected. The spies of the friendly Indians—the keenest that could be employed—were unable to discover their retreat. It was supposed that they intended to act only on the defensive—that is, to make plundering forays on whatever quarter was left unguarded by troops, and then retire with their booty to the fastnesses of the swamp. Their conduct up to this time rendered the supposition probable enough. In such case, the war might not be so easily brought to a termination; in other words, there might be no war at all, but a succession of fruitless marches and pursuits; for it was well enough understood that if the Indians did not choose to stand before us in action, we should have but little chance of overhauling them in their retreat.

The fear of the troops was, that their adversaries would 'take to the cover,' where it would be difficult, if not altogether impossible, to find them.

However, this state of things could not be perpetual; the Indians could not always subsist upon plunder, where the booty must be every day growing less. They were too numerous for a mere band of robbers, though there existed among the whites a very imperfect idea of their numbers. Estimates placed them at from one to five thousand souls—runaway negroes included—and even the best

informed frontiersmen could give only rude guesses on this point. For my part, I believed that there were more than a thousand warriors, even after the defection of the traitor clans; and this was the opinion of one who knew them well—old Hickman the hunter.

How, then, were so many to find existence in the middle of a morass? Had they been provident, and there accumulated a grand commissariat? No: this question could at once be answered in the negative. It was well known that the contrary was the case—for in this year the Seminoles were without even their usual supply. Their removal had been urged in the spring; and, in consequence of the doubtful prospect before them, many families had planted little—some not at all. Their crop, therefore, was less than in ordinary years; and previous to the final council at Fort King, numbers of them had been both buying and begging food from the frontier citizens.

What likelihood, then, of their finding subsistence throughout a long campaign? They would be starved out of their fastnesses—they must come out, and either stand fight, or sue for peace. So people believed.

This topic was discussed as we rode along. It was one of primary interest to all young warriors thirsting for fame—inasmuch as, should the enemy determine to pursue so inglorious a system of warfare, where were the laurels to be plucked? A campaign in the miasmatic and pestilential climate of the swamps was more likely to yield a luxuriant crop of cypresses.

Most hoped, and hence believed, that the Indians would soon grow hungry, and shew themselves in a fair field of fight.

There were different opinions as to the possibility of their subsisting themselves for a lengthened period of time. Some—and these were men best acquainted with the nature of the country—expressed their belief that they could. The old alligator-hunter was of this way of thinking.

'Thuv got,' said he, 'thet ere durned brier wi' the big roots they calls "coonty;"* it grows putty nigh over all the swamp, an' in some places as thick as a cane-brake. It ur the best o' eatin', an' drinkin' too, for they make a drink o' it. An' then thar's the skurns o' the live-oak—they ere ain't sech bad eatin', when well roasted i' the ashes. They may gathur thousands o' bushels, I reckon. An' nixt thar's the cabbidge in the head o' the big palmetter; thet ere'll gi' them greens. As to thar meat, thar's deer, an' thar's bar—a good grist o' em in the swamp—an' thar's allygatur, a to'ably goodish wheen o' them varmint, I reckon—to say nothin' o' turtle, an' turkey, an' squ'r'illa, an' snakes, an' sandrats; for, durn a red-skin! he kin eat anythin' that crawls—from a punkin to a polecat. Don't you b'lieve it, fellars? Them ere Injuns ain't a gwine to starve, s'easy as you think for. Thu'll hold out by thar teeth an' toe-nails, jest so long as thar's a eatable thing in the darnationed swamp—that's what thu'll do.'

This sage reasoning produced conviction in the minds of those who heard it. After all, the despised enemy might not be so helpless as was generally imagined.

The march of the volunteers was not conducted in a strict military style. It was so commenced; but the officers soon found it impossible to carry out the 'tactics.' The men, especially the younger ones, could not be restrained from occasionally falling out of the lines—to help themselves to a pull out of some odd-looking flask; and at intervals one would gallop off into the woods, in hopes of getting a shot at a deer or turkey he had caught a glimpse of through the trees.

* *Smilax pseudo-china*.

Reasoning with these fellows, on the part of their officers, proved rather a fruitless affair; and getting angry with them, was only to elicit a sulky rejoinder. Sergeant Hickman was extremely wroth with some of the offenders.

'Greenhorns!' he exclaimed; 'darnationed greenhorns! let 'em go on at it. May a allygatur eet me, if they don't behave diff'rent by 'm by. I'll stake my critter agin any hoss in the crowd, that some o' them ere fellars 'll git sculped afore sundown; durned if they don't.'

No one offered to take the old hunter's bet, and fortunately for them, as his words proved prophetic.

A young planter, fancying himself as safe as if riding through his own sugar-canes, had galloped off from the line of march. A deer, seen browsing in the savanna, offered an attraction too strong to be resisted.

He had not been gone five minutes—had scarcely passed out of sight of his comrades—when two shots were heard in quick succession; and the next moment, his riderless horse came galloping back to the troop.

The line was halted, and faced in the direction whence the shots had been heard. An advance-party moved forward to the ground. No enemy was discovered, nor the traces of any, except those exhibited in the dead body of the young planter, that lay perforated with a brace of bullets just as it had fallen out of the saddle.

It was a lesson—though an unpleasant one to his comrades—and after this, there were no more attempts at deer-stalking. The man was buried on the spot where he lay; and with the troop more regularly and compactly formed—now an easier duty for its officers—we continued the march unmolested, and before sunset were within the stockade of the fort.

CHAPTER LXII.

A KNOCK ON THE HEAD.

Excepting the memory of one short hour, Fort King had for me no pleasant reminiscences. There had been some new arrivals in my absence, but none of them worthy of companionship. They only rendered quarters more crowded, and accommodation more difficult to obtain. The sutler and the blacklegs were rapidly making their fortunes; and these, with the quartermaster, the commissary,* and the 'beef-contractor,' appeared to be the only prosperous men about the place.

The 'beau' was still chief aid-de-camp, gaily caparisoned as ever; but of him I had almost ceased to think.

It was not long before I was ordered upon duty—almost the moment after my arrival—and that, as usual, of a disagreeable kind. Before I had time to obtain a moment's rest after the long ride—even before I could wash the road-dust from my skin—I was summoned to the quarters of the commander-in-chief.

What could he want with me, in such hot haste? Was it about the duels? Were these old scores going to be reckoned up?

Not without some apprehension did I betake myself into the presence of the general.

It proved, however, to be nothing concerning the past; though, when I learned the duty I was to perform, I half regretted that it was not a reprimand.

I found the agent closeted with the commander-in-chief. They had designed another interview with Omatla and 'Black Dirt.' I was merely wanted as an interpreter.

* In the United States army, these two offices are quite distinct. A 'commissary' caters only for the inner man; a quartermaster's duty is to shelter, clothe, arm, and equip. A wise regulation.

The object of this fresh interview with the chief was stated in my hearing. It was to arrange a plan for concerted action between the troops and the friendly Indians, who were to act as our allies against their own countrymen; the latter—as was now known by certain information—being collected in large force in the 'Cove of the Outhlacoochee.' Their actual position was still unknown; but that, it was confidently hoped, would be discovered by the aid of the friendly chiefs, and their spies, who were constantly on the run.

The meeting had been already pre-arranged. The chiefs—who, as already stated, had gone to Fort Brooke, and were there living under protection of the garrison—were to make a secret journey, and meet the agent and general at an appointed place—the old ground, the hommock by the pond.

The meeting had been fixed for that very night—as soon as it should be dark enough to hide the approach of both tempters and traitors.

It was dark enough almost the moment the sun went down—for the moon was in her third quarter, and would not be in the sky until after sunset.

Shortly after twilight, therefore, we three proceeded to the spot—the general, the agent, and the interpreter, just as we had done on the former occasion.

The chiefs were not there, and this caused a little surprise. By the noted punctuality with which an Indian keeps his assignation, it was expected they would have been upon the ground, for the hour appointed had arrived.

'What is detaining them? What can be detaining them?' mutually inquired commissioner and general.

Scarcely an instant passed till the answer came. It came from afar, and in a singular utterance; but it could be no other than a reply to the question—both my companions conjectured.

Borne upon the night-breeze was the sound of strife—the sharp cracking of rifles and pistols; and, distinctly heard above all, the shrill *Yo-ho-choe*.

The sounds were distant—away amid the far woods; but they were sufficiently distinct to admit of the interpretation, that a life-and-death struggle was going on between two parties of men.

It could be no feint, no false alarm to draw the soldiers from the fort, or terrify the sentinel on his post. There was an earnestness in the wild treble of those shrill cries, that convinced the listener human blood was being spilled.

My companions were busy with conjectures. I saw that neither possessed a high degree of courage, for that is not necessary to become a general. In my warlike experience, I have seen more than one hiding behind a tree or a piece of wall. One, indeed, who was afterwards elected the chief of twenty millions of people, I have seen skulking in a ditch to screen himself from a stray shot, while his lost brigade, half a mile in the advance, was gallantly fighting under the guidance of a sub-lieutenant.

But why should I speak of these things here? The world is full of such heroes.

'It is they, by —,' exclaimed the commissioner. 'They have been waylaid; they are attacked by the others: that rascal Powell for a thousand!'

'It is extremely probable,' replied the other, who seemed to have a somewhat steadier nerve, and spoke more coolly. 'Yes, it must be. There are no troops in that direction; no whites either—not a man. It must therefore be an affair among the Indians themselves; and what else than an attack upon the friendly chiefs? You are right, Thompson; it is as you say.'

'If so, general, it will be of no use our remaining here. If they have waylaid Omatla, they will of course have superior numbers, and he must fall. We need not expect him.'

'No; he is not likely to come, neither he nor Lusta. As you say, it is idle for us to remain here. I think we may as well return to the fort.'

There was a moment's hesitation, during which I fancied both generals were debating in their own minds whether it would be *graceful* thus to give up their errand and purpose.

'If they should come'—continued the soldier.

'General,' said I, taking the liberty to interrupt him, 'if you desire it, I shall remain upon the ground for a while, and see. If they should come,' I added, in continuation of the broken sentence, 'I can proceed to the fort, and give you notice.'

I could not have made a proposition more agreeable to the two. It was instantly accepted, and the brace of official heroes moved away, leaving me to myself.

It was not long ere I had cause to regret my generous rashness. My late companions could scarcely have reached the fort when the sounds of the strife suddenly ceased, and I heard the *caha-queene*—the Seminole shout of triumph. I was still listening to its wild intonations, when half-a-dozen men—dark-bodied men—rushed out of the bushes, and surrounded me where I stood.

Despite the poor light the stars afforded, I could see shining blades, guns, pistols, and tomahawks. The weapons were too near my eyes to be mistaken for the fire-flies that had been glittering around my head; besides, the clink of steel was in my ears.

My assailants made no outcry, perhaps because they were too near the fort; and my own shouts were soon suppressed by a blow that levelled me to the earth, depriving me as well of consciousness as of speech.

CHAPTER LXIII.

AN INDIAN EXECUTIONER.

After a short spell of oblivioness, I recovered my senses. I perceived that the Indians were still around me, but no longer in the menacing attitudes in which I had seen them before being struck down; on the contrary, they appeared to be treating me with kindness. One of them held my head upon his knee, while another was endeavouring to stanch the blood that was running freely from a wound in my temples. The others stood around regarding me with interest, and apparently anxious about my recovery.

Their behaviour caused me surprise, for I had no other thought than that they had intended to kill me; indeed, as I sank under the stroke of the tomahawk, my senses had gone out, under the impression that I was killed. Such a reflection is not uncommon to those whom a blow has suddenly deprived of consciousness.

My surprise was of an agreeable character. I felt that I still lived—that I was but little hurt; and not likely to receive any further damage from those who surrounded me.

They were speaking to one another in low tones, pronouncing the prognosis of my wound, and apparently gratified that they had not killed me.

'We have spilled your blood; but it is not dangerous,' said one, addressing himself to me in his native tongue. 'It was I who gave the blow. *Huhwak!* it was dark. Friend of the Rising Sun! we did not know you. We thought you were the *yatika-chucco*.* It is his blood we intended to spill. We expected to find him here; he has been here: where gone?'

I pointed in the direction of the fort.

'*Huhwak!*' exclaimed several in a breath, and in a tone that betokened disappointment; and then turning aside, they conversed with each other in a low voice.

'Fear not,' said the first speaker, again standing

before me, 'friend of the Rising Sun! we will not do further harm to you; but you must go with us to the chiefs. They are not far off. Come!'

I was once more upon my feet, and perhaps by a desperate effort might have escaped. The attempt, however, might have cost me a second knock-down—perhaps my life. Moreover, the courtesy of my captors at once set my mind at ease. Go where they might, I felt that I had nothing to fear from them; and, without hesitation, I consented to accompany them.

My captors, throwing themselves into single file, and assigning me a position in their midst, at once started off through the woods. For some time we walked rapidly, the path taken by the leader of the party being easily followed, even in the darkness, by those behind. I observed that we were going in the direction whence had been heard the sounds of the conflict, that had long since ceased to vibrate upon the air. Of whatever nature had been the struggle, it was evidently brought to a close, and even the victors no longer uttered the *caha-queene*.

We had advanced about a mile when the moon arose; and the woods becoming more open, I could see my captors more distinctly. I recognised the features of one or two of them, from having seen them at the council. They were warriors of the Micosauc tribe, the followers of Ogeola. From this I conjectured that he was one of the chiefs before whom I was being conducted.

My conjecture proved correct. We had not gone much further, when the path led into an opening in the woods, in the midst of which a large body of Indians, about a hundred in all, were grouped together. A little apart was a smaller group—the chiefs and head warriors. In their midst I observed Ogeola.

The ground exhibited a singular and sanguinary spectacle. Dead bodies were lying about gashed with wounds still fresh and bleeding. Some of the dead lay upon their backs, their unclosed eyes glaring ghastly upon the moon, all in the attitudes in which they had fallen. The scalping-knife had done its work, as the whitish patch upon the crowns, laced with seams of crimson red, shewed the skulls divested of their hirsute covering. Men were strolling about with the fresh scalps in their hands, or elevated upon the muzzles of their guns.

There was no mystery in what I saw; I knew its meaning well. The men who had fallen were of the traitor tribes—the followers of Lusta Hajo and Omatla.

According to the arrangement with the commissioner, the chiefs had left Fort Brooke, accompanied by a chosen band of their retainers. Their intention had become known to the patriots—their movements had been watched—they had been attacked on the way; and, after a short struggle, overpowered. Most of them had fallen in the *melee*—a few, with the chief Lusta Hajo, had contrived to escape; while still another few—among whom was Omatla himself—had been taken prisoners during the conflict, and were yet alive. They had been rescued from death only to suffer it in a more ceremonial shape.

I saw the captives where they stood, close at hand, and fast bound to some trees. Among them I recognised their leader, by the grace of Commissioner Thompson, 'king of the Seminole nation.'

By those around, his majesty was now regarded with but slight deference. Many a willing regicide stood near him, and would have taken his life without further ceremony. But these were restrained by the chiefs, who opposed the violent proceeding, and who had come to the determination to give Omatla a trial, according to the laws and customs of their nation.

* The 'great speaker'—the commissioner.

As we arrived upon the ground, this trial was going on. The chiefs were in council.

One of my captors reported our arrival. I noticed a murmur of disappointment among the chiefs as he finished making his announcement. They were disappointed: I was not the captive they had been expecting.

No notice was taken of me; and I was left free to loiter about, and watch their proceedings, if I pleased.

The council soon performed its duty. The treason of Omatla was too well known to require much canvassing; and, of course, he was found guilty, and condemned to expiate the crime with his life.

The sentence was pronounced in the hearing of all present. The traitor must die.

A question arose—who was to be his executioner?

There were many who would have volunteered for the office—for to take the life of a traitor, according to Indian philosophy, is esteemed an act of honour. There would be no difficulty in procuring an executioner.

Many actually did volunteer; but the services of these were declined by the council. This was a matter to be decided by vote.

The vote was immediately taken. All knew of the vow made by Oçeola. His followers were desirous he should keep it; and on this account, he was unanimously elected to do the deed. He accepted the office.

Knife in hand, Oçeola approached the captive, now cowering in his bonds. All gathered around to witness the fatal stab. Moved by an impulse I could not resist, I drew near with the rest.

We stood, in breathless silence, expecting every moment to see the knife plunged into the heart of the criminal.

We saw the arm upraised, and the blow given, but there was no wound—no blood! The blade had descended upon the thongs that bound the captive, and Omatla stood forth free from his fastenings!

There was a murmur of disapprobation. What could Oçeola mean? Did he design that Omatla should escape? the traitor condemned by the council—by all?

But it was soon perceived he had no such intention—far different was his design.

‘Omatla!’ said he, looking his adversary sternly in the face, ‘you were once esteemed a brave man, honoured by your tribe—by the whole Seminole nation. The white men have corrupted you—they have made you a renegade to your country and your cause; for all that, you shall not die the death of a dog. I will kill, but not murder you. My heart revolts to slay a man who is helpless and unarmed. It shall be a fair combat between us, and men shall see that the right triumphs. Give him back his weapons! Let him defend himself, if he can.’

The unexpected proposal was received with some disapprobation. There were many who, indignant at Omatla's treason, and still wild with the excitement produced by the late conflict, would have butchered him in his bonds. But all saw that Oçeola was determined to act as he had proposed; and no opposition was offered.

One of the warriors, stepping forward, handed his weapons to the condemned chief—only his tomahawk and knife, for so Oçeola was himself armed.

This done, by a sort of tacit understanding, the crowd drew back, and the two combatants stood alone in the centre.

The struggle was brief as bloody. Almost at the first blow, Oçeola struck the hatchet from his antagonist's hand, and with another stroke, rapidly following, felled Omatla to the earth.

For a moment the victor was seen bending over

his fallen adversary, with his long knife unsheathed and glittering in the moonlight.

When he rose erect, the steel had lost its keen—it was dimmed with crimson blood.

Oçeola had kept his oath. He had driven his blade through the heart of the traitor—Omatla had ceased to live.

White men afterwards pronounced this deed an assassination—a murder. It was not so, any more than the death of Charles, of Caligula, of Tarquin—of a hundred other tyrants, who have oppressed or betrayed their country.

Public opinion upon such matters is not honest; it takes its colour from the cant of the times, changing like the hues of the chameleon. Sheer hypocrisy, shameful inconsistency! He only is a murderer who kills from a murderer's motive. Oçeola was not of this class.

My situation was altogether singular. As yet, the chiefs had taken no notice of my presence; and notwithstanding the courtesy which had been extended to me by those who conducted me thither, I was not without some apprehensions as to my safety. It might please the council, excited as they were with what had just transpired, and now actually at war with our people, to condemn me to a fate similar to that which had befallen Omatla. I stood waiting their pleasure, therefore, in anything but a comfortable frame of mind.

It was not long before I was relieved from my apprehensions. As soon as the affair with Omatla was ended, Oçeola approached, and in a friendly manner stretched out his hand, which I was only too happy to receive in friendship.

He expressed regret that I had been wounded and made captive by his men—explained the mistake; and then calling one of his followers, ordered him to guide me back to the fort.

I had no desire to remain longer than I could help upon such tragic ground; and, bidding the chief adieu, I followed my conductor along the path.

Near the pond, the Indian left me; and, without encountering any further adventures, I re-entered the gates of the fort.

A QUESTION.

What makes my brow to throb and ache?
What makes mine eyes to weep begin?
What makes my limbs beneath me quake,
With shooting pains? Ah me! The Influenza!

What makes my hand so dry and hot?
Whence comes this changeless, ceaseless din—
This ringing in mine ears? Oh, what—
What can it be? Ah me! The Influenza!

What makes me turn my ‘m’s’ to ‘b’s’;
And talk of ‘chill,’ instead of ‘chill’;
And speak profanely of my ‘d—s,’
Instead of ‘knees’? Ah me! The Influenza!

What makes my nose as red as fire?
What makes such parchment of my skin?
What makes me sneeze—when my desire
Is not to sneeze? Ah me! The Influenza!

No. 227.

SATURDAY, MAY 8, 1858.

PRICE 1½d.

'WANT SOMETHING TO READ.'

NEXT to 'going out to play,'* there is nothing so important to many children, most children I may say, as getting something to read. After a certain age, and the attainment of a certain amount of scholarship, almost every child begins to 'read to itself'—it may be not omnivorously—perhaps in a very trifling manner and degree: a child who does not read at all, and does not like reading of some sort or other, is almost an anomaly now-a-days, at least, among what we proudly term 'the educated classes.'

It is curious to trace the rise, progress, and development of this branch of education, informal and unconscious, yet which, more than any others, influences the mind, character, and disposition of a growing-up child. I speak not of prodigies or precocious geniuses, but of ordinary boys and girls, just waking up to think about—not themselves—they rarely trouble their little heads with self-contemplation, and it is a very bad sign if they do—but the wonderful world they have come into; about which their chief sentiment is an insatiable curiosity.

No one can spend half a day in the company of a moderately intelligent child, if only arrived at the age of 'What's dat?' 'What zu doin'?' 'What zu dot in zu pottet?' without remarking what an extraordinary peculiarity of the infant mind is this same curiosity. 'Little people should not want to know everything'—'Little people should learn not to ask questions'—wise axioms of our grandmothers!—but I trust we are learning to deal more wisely with our little people. To the contemplative mind, there is something solemn, almost awful, in this ardent desire to know, beginning with the six-months' old babe who stretches uncertain fingers to its mother's bright neck-ribbon, or screams because it is not allowed to catch hold of the flame of the candle. A psychologist, moralising over the mysteries of our being, might perhaps see therein one of the strongest natural proofs of the soul's immortality.

I have often thought it might be useful if people would take the trouble to recall and jot down their own experiences of this craving after knowledge—this unquenchable thirst which is only allayed by reading. And, just as one experience out of many, which may rouse thoughtful elders to reflect a little on their own youth, in the dealing with that mysterious piece of God's handiwork, as yet unspoiled by man—a

child—I shall here set down a few recollections about our reading and our books when we were children.

In those days, juvenile literature was very different from what it is now; there were no children's publishers, making it their speciality to furnish the ravenous youthful maw with the best species of aliment, employing excellent authors to chronicle *Dr Birch and his Young Friends*, *Grandmamma's Pockets*, and *Good-natured Bears*; and illustrating *Cinderella* and *The White Cat* with almost as good art as then adorned the walls of the Royal Academy. Even the cheap periodicals now littering about every house, and to be picked up by every child on every parlour-table, had not then begun their career. No *Illustrated News*—no *Punch*—no *Household Words*—no *Chambers's Journal*: only a month's-old magazine, or accidental newspaper, chiefly provincial—for we were provincial children—reached our eager hands. And even this species of fugitive literature was limited; we were not rich, had no large domestic library, nor did we live in a reading community. I only remember three houses where it was grand to go to tea, because—you were sure of getting a book to read. But this is forestalling.

Does any one call to mind his or her first book? The very first time when, arrived a step above c, a, t, cat, and d, o, g, dog, some strange volume, not the spelling-book, was taken in hand and blundered over, sticking at all the hard words, which were either puzzled out or skipped altogether, as character or talents impelled. Fairly got into, what a wonderful thing it was! A book—something interesting—something which out of its tame black and white pages could afford an enjoyment, intangible certainly, involving nothing to eat, or drink, or play with, yet exquisitely real, substantial, and satisfying, as nothing had ever been before.

Of my first book I have the strongest impression, still. It was *The Robins*—by Mrs Sherwood, I fancy, but am not sure, never having beheld it since the age of six. It was lent me by a playmate of seven, and accompanied by the gift of a little black top. The top I cherished—whipped affectionately for years—and have got somewhere still, in memory of a warm heart that death only could ever have made cold; but the book was slighted; until, casually opening it one day, I found I could read.

It was—for the edification of my readers who know it not—the summer's history of a pair of robin-red-breasts, taken from the robin side; in fact, what I may call the bird's-eye view of the subject. Vitaly interesting were all their domestic proceedings, from the building of the nest in the ivy wall to the successive

* See *Journal*, No. 218.

appearance—equalling in importance the arrival of 'our baby'—of four young birds, Robin, Dicky, Flapay, and Peckay. As I write down their names, how the idea of them comes back! each as strongly individualised as any featherless bipeds I ever knew. Robin, the eldest, a brave, generous, haram-scarum bird, who, determined not to be taught to fly, but to teach himself, came to grief and a broken wing, was unable to return to the nest, and had to subsist for the rest of the summer under a dock-leaf—a 'shocking example'—fondly tended by his amiable sister Peckay; Dicky and Flapay—far less interesting characters—who were always allied in either mischief or pleasure, never did anything naughty or good; and the two elderly birds, exceedingly moral and parental, who, nevertheless, to my surprise, contentedly turned the young ones adrift, left the nest, and subsisted for the winter on the crumbs of the family who owned the garden.

This family, with enormously big faces, head *et præterea nihil*, portrayed in the frontispiece, looking in at the nest—were quite secondary characters. The bird-life was all in all. Such a glorious sense it gave of the delight of living under ivy-leaves, and being fed with a worm on a bright summer morning; of learning to fly, and then wandering at ease from tree to tree, receiving occasional moral lessons about guns, traps, and the duty of not robbing overmuch the protecting family. Memory may have exaggerated and put much in the book that was not there, but the general impression is ineffaceable. Even now when every morning I meet that graceful, gentlemanly old robin, who looks at me for a moment with his shy, bright eye, and then hops away under a gooseberry-bush—I often think: 'My little friend, can you be any descendant of those familiar friends of mine, far back in distant ages, who lived—scarcely in paper and printer's ink—but in a real garden, in a real nest under an ivy-wall.'

The Robins must have been our very first era in literature. Our next was *Sindbad the Sailor*, *Robinson Crusoe*, and *Jack the Giant-killer*—not elegantly got up, but coarsely printed in paper-covers, with 'cuts' instead of 'plates.' Extraordinary cuts some of them were—as, seeing one of the same editions lately, I found out. Vividly it recalled all the rest: Crusoe seeing the footprints in the sand, Crusoe and his man Friday; Sindbad carried up by the roc, Sindbad put into the open coffin and let down into the funeral cave; also Jack, sitting genteelly at table with the ugliest of giants, who it was half-fearful might 'frighten' us; but, bless you! we were never frightened at anything of that sort. We had no nursemaid to tell us horrible tales of 'Bogie' and the 'Black Man'—all we ever heard or learned for the first seven years of our lives came direct from the fountain-head—the fountain of all tenderness, and safety, and loving-kindness. In this, our poverty was more blessed than if we had been heirs to

All the wealth that fills the breeze
When Ooromandel's ships return from Indian seas.

This reminds me that in our earlier days we thought very little of poetry. Nobody ever bothered us with Dr Watts's Hymns, or any hymns at all—nor crammed our poor little brains with cant words and phrases, of which the ideas were either totally incomprehensible, or received in a form so material as to be either ludicrous or profane. Accidentally, we lighted on 'The Busy Bee,' 'Hush, my Babe, lie still, and slumber,' took a fancy to them, and learned them by heart; also, many of the *Original Poems for Children*—Miss Aikin's, I believe—which have been the delight of generations. But we never meddled with religious poetry, nor were set to learn it as a task, any more than the Bible—the book of books—

which we all read aloud reverently, verse by verse, elders and youngsters alternately, every Sunday evening.

For our secular reading, out of lesson-time, we were obliged to depend on ourselves. The treat of being read to was quite impossible in our busy household. Therefore, possessing what is now called in grand phrase 'a healthy animalism'—which I take to mean the ordinary sanitary state of most children who are neither physicked nor 'codled'—we gave the largest portions of our energies to play, and, with the exceptions mentioned, were rather indifferent to books. Gradually, however—on wet days and long winter evenings—we began to want something to read—something real; for we were wakening up to the conviction that rocs were not as common as sparrows, and that the Lilliputian which some of us longed to find and be a most loving Glumdalclitch to, was not likely to be picked up in our field, or any field. In short, we wanted facts.

And here came in a book, which I have since suspected to be as fabulous as *Robinson Crusoe* itself, but which then we entirely credited—*Roland's Travels round the World*. Its hero, with his companions—the naturalist, the man of science, the doctor—who, I recollect, had a most unmedical propensity for eating—with all their adventures, were an inexhaustible delight. Earnestly we longed to penetrate to the interior of that marvellous Africa, the map of which, so often consulted by us prior to the days of lion-hunters, persevering brothers Lander, and modest brave Livingstones—was, except for the coast-line, a mere blank—a circumstance probably all the safer for our voracious Rolandi.

Another book of adventure, which likewise I have never seen since, and which maturer wisdom is still loath to recognise as fiction, was Miss Porter's *Narrative of Sir Edward Seaward*. Strange that an enterprising modern publisher has ever disinterred and revived in a cheap edition that charming old book, with its *bonâ-fide* simplicity of detail, its exquisite picture of the solitary island where Seaward and his Eliza are wrecked, and live à la Crusoe—and Mrs Crusoe—during the first years of their married life; where they afterwards found a colony; then returning to England, bask in the favour of King George and Queen Caroline, and become Sir Edward and Lady Seaward; though something less happy, as the reader feels, than the young pair cast away on that lovely, lonely Pacific island.

The Pacific seas gained another charm for us when somewhat about this era we lighted on G. L. Craik's *New Zealanders*. Every many-vowelled polysyllabic name, every grim countenance therein, was familiar to us as those of our brethren and companions. Much we lamented that tattoo and paint, mats and war-clubs, were not the customary costume of youthful Britons; and to live in a hut, and squat round a baked pig, seemed to us preferable to any civilised notions about houses and dinners. As it was, the sole thing left to us was to practise drinking out of a calabash, holding the—for calabash, read mug—high up, at arm's-length, in the approved New Zealand fashion. I should be sorry to confess how many times we soaked our pinafors through and through, before this art was attained in perfection.

Captain Cook's Voyages, and his Geography, in two thick quartos, with maps and engravings innumerable, came in also, to confirm the mania for all things pertaining to the southern seas, which lasted a long time, and may have influenced the family fortunes more than was then dreamed of. To this day, both to those of us who have seen it, and those who have not, there lingers a curious charm about that antipodean hemisphere, with its strange plants, strange animals, strange stars, strange skies: its

mysterious half-known continents, and its solitary coral islands starting up from the depths of undiscovered seas.

This was our sole bit of romance. Compared with what I have since heard of other people's childhood, ours seems the most matter-of-fact imaginable. We lived in a new manufacturing district, where was not a trace of legendary lore; and we must have been quite 'old' children before we ever heard about ghosts or fairies. Also, our elders and superiors, though extremely well educated, happened to have a far stronger bias towards science, mathematics, and general solid knowledge, than towards art or the poetical side of literature. The first bit of real art I ever remember to have got hold of was Flaxman's *Home*—beloved still as the key-note of what has been the pleasant music of a lifetime—but I am now writing of books, not pictures. It stirred me up to the study of the *Iliad* and *Odyssey*: these two, with Thomson's *Seasons* and Young's *Night Thoughts*—after I had conquered a great dislike to the frontispiece, representing a gentleman sitting at night in his study, and Death, a skeleton with scythe and hour-glass, coming to hold with him a little cheerful conversation—constitute the only poetry-books I have any distinct recollection of.

Nobody else studied them: the family bent was all towards science. Many books of the era come to mind: *Endless Amusements*—which would have deserved its name, save for the unfortunate fact that the experiments therein would have cost the whole domestic income—the *Boy's Own Book*, and the *Boy's Book of Science*. This latter was thumbed over from morning till night—as may be discovered if its relics be ever exhumed for the benefit of its owner's descendants—but I myself never got further than the illustrations, which were very pretty and artistic, and consisted of little fat nude boys busy over a blow-pipe, or an electrical machine, or a series of mysterious phials. I admired them much, but thought the little fellows looked rather cold, and wondered if it were always necessary to conduct scientific experiments without one's clothes.

At this period, we took to book-borrowing, in which our chief trouble was that benevolent friends would lend us 'childish' books. One of us, the little one, still recalls having *Sandford and Merton* thus foisted upon him, which he rejected; when being told to go and choose what he liked, he returned with Brande's *Chemistry*, Mrs Marce's *Conversations*, Ure's *Dictionary of Arts and Sciences*, or something else of the kind, which alone he considered 'interesting.'

To this I attribute our indifference to Miss Edgeworth, Mrs Barbauld, and other excellent writers for children, that we read them at too late an age, when we wanted to know about men, women, and things in general. Thus, I remember luxuriating in Goldsmith's dry school-histories; having a personal friendship for Themistocles and Epaminondas, a familiar acquaintance with all the old Romans, and a passionate pity for Charles I., which made me dream over and over again, for years, of his taking refuge in our house, my putting him into the cupboard or up the chimney, then dismissing him to safety with an infinitude of blessings, caresses, and tears. After this, what were *Harry and Lucy*, *Rosamond*, and the *Parents' Assistant*?

To one writer of this class, now almost forgotten, I must make an exception. Few books in all my life have ever done me so much good—the true aim of all good books—as Mrs Holland's. Simple, natural, neither dragging the young mind down to its supposed level, which it has already got far beyond, nor burdening it with dry morality, or, what is worse, religious cant, yet breathing throughout the true spirit both of religion and morality, her stories for

young people, such as the *Clergyman's Widow*, *Blind Farmer*, and *Son of a Genius*, deserve to live as long as there are any young people to read them.

Writers for children are too apt to forget how uncommonly 'sharp' is the little public they have to deal with; how, whatever be its own voluntary make-believes, it is quick as lightning to detect and spurn any make-believe in grown-up people, especially when meant to take in its small self. Hypocritical goodness, impossible self-denial, it rejects at once, as it does pictures of life where the moral is incessantly intruding, where the bad child is always naughty, and the good child never does anything wrong, where the parents are paragons of superlative wisdom and faultless perfection, and every action good or bad immediately meets its reward. Such tales are not of the least value, because they are not life—they are not true. Give a child as much of fancy and imagination as ever you choose—in fairy tale, legend, and the like—which it will play with like toys, and take no harm from; but, in Heaven's name, respect in it that instinct which comes direct from Heaven, and never in word or writing, in teaching or in conduct, set before it as reality that which is not true.

About this stage in our juvenile history, a remarkable fact occurred. Our next-door neighbour began taking in a periodical—a large, small-printed folio sheet, with more 'reading' in it than any newspaper, entitled *Chambers's Edinburgh Journal*. How we used to rush in on Saturday afternoons to borrow it, and rush off again to some corner, where it could be read in quiet! How we hid it, and squabbled over it!—what tears it cost, what reproofs!—till at last, as the only chance of peace, the Journal was forbidden ever to enter the house; consequently, we read it in the garden. I am afraid—I know—we were very naughty; but the thirst for reading was now becoming uncontrollable in all of us. I can recall, spite of the guilty conscience with which I handled this grand bone of contention, what exquisite delight there was in hiding it under my pinafore, or under a big stone, till I could devour it in secret; how, even yet, I can see clearly the shape, form, and type of some of the articles, such as the leader entitled 'The Downdraught,' and the bit of poetry beginning,

Pretty Polly Partan, she was a damsel gay—

little, how little thinking that I should ever be confessing this in the pages of the same Journal!

But all this while, in none of us had germinated, in any shape, the romantic element. With me it first sprouted, I believe, not through anything I read, but through being read to, myself and my favourite companion, during one summer, and at intervals several other summers and winters. Dim as a dream are those readings, chosen wisely by one who knew better than most what children's tastes were, and especially what sort of tastes we two had. Fragments out of unknown books, Mary Hewitt's poems and tales, Mrs Austen's German translations, Shakespeare, Scott, Chaucer—old ballads and modern verses—a heterogeneous mixture, listened to on sunshiny mornings, with the rose-scent in the hedges, and the birds hopping about on the grass-plot; or on winter evenings, rocking in the American rocking-chair, in the snug little school-room, which neither we nor our children are ever likely to revisit more. Dim as a dream, I say, but sweet as anything in my whole childhood remains the grateful remembrance of these readings and the voice that read; which, to this day, when enjoying the ineffable luxury of sitting sewing and listening to a book, seems to me about the pleasantest voice of any woman's I ever heard.

The next epoch I have to chronicle was the grand turning-point of our childhood—the literary crisis of our lives. One fatal winter, we, whose doors sickness

had rarely or never entered, caught successively measles, hooping-cough, and chicken-pox, and never went out to play again till the spring. Then, shut up in a few small rooms, weary, sickly, and cross—not dangerously ill, but ill enough to be a burden to ourselves, and a plague to one another, what could we do to pass the heavy time away? What was to become of us?

I really do not know what would have become of us—so far as temper was concerned—had it not been for the interference of a benign providence, in the shape of the bookseller of the town, who granted us free range of his circulating library. To him and to his 'young man'—getting an old man now, I conclude—who took the trouble of selecting our books, changing them as often or letting us keep them as long as ever our fancy chose; who was as patient and good-natured with us poor sick children as if we had been the grandest paying subscribers—I hereby offer—should this Journal lie on his counter, as probably it will—our warmest gratitude. It may be a hint to other book-lenders, less mindful of the cravings of reading-children; and it is a relief to our minds thankfully to confess that much of what any of us has ever been, or may be, is owing to that 'winter of our discontent' made such 'glorious summer' by this unlimited supply of books.

What they consisted of, it is impossible to enumerate. I know they comprised fact and fiction, provender solid and light, classical and unclassical, and that their quantity was enormous; that they set us fairly afloat on the great sea of literature, which, thenceforward, never had a bound.

Of course, individual tastes developed rapidly. Science, from a bias, became a steadily progressing knowledge; art, from a mere fancy, grew into a passion; and imaginative and romantic tendencies sprang up full-grown, as it were, in a day. Our range of novel-reading comprised everything we could lay hands upon: Scott, Bulwer, Mrs Opie, Miss Austen, and a writer whom we knew nothing about, but that he was almost as funny as his name, which was 'Boz.' I also remember our picking up the first number of a serial which we, already beginning to be critical, considered rather dull, and the characters decidedly unpleasant: it was entitled *Vanity Fair*. Of inferior romances, the amount of trash we consumed was something past reckoning; but, like all literary rubbish, it slipped out of our heads as fast as ever it was 'shot' into them. We never took any harm from it that I am aware of.

And here I would fain say a word about our experience of what are termed 'improper' books. We never had any, although we were allowed to read *ad libitum* everything that came in our way; for a very simple reason—the guardians of our morals put everything really hurtful quite out of our way. No tabooed volumes; no pages torn out, nor—as I have heard of an excellent paterfamilias doing—marked in the margin, 'Not to be read,' which seems a good deal to expect from any juvenile self-denial. Our elders never exacted from us anything they did not require from themselves: any species of literary provender wholly unfit for our youthful digestion, was either never known by us to be in the house, or—better still—was never brought into the house at all. The only instance of prohibition or hesitation that I ever remember was the *Vicar of Wakefield* (why, I cannot to this day discover), which, probably from some advice of less wise friends, was laid on the top shelf of the book-cupboard with, 'Better read it when you are a little older.' I gazed at it longingly for some weeks, then climbed up, and read the first twenty pages or so—for I did not find it interesting enough to read further—standing perched on the back of a chair.

Shakspeare even—that great difficulty of the permission except myself, and I did not care much for him, except for the purely imaginative plays, such as the *Tempest*, *Midsummer Night's Dream*, and *Winter's Tale*. Still, I must have read him all through, for I scarcely remember the time when I did not know Shakspeare—but I understood him very little for a great many years. As for seeing any evil in him, I would as soon have thought of seeing it in the Bible, which, not to speak irreverently of the Holy Word, contains a good deal that the fastidious delicacy of the present day might consider 'not exactly proper for children.'

Therefore, if individual experience may be allowed to say so, I do think that with children brought up in a virtuous, decorous home, where, 'to the pure, all things are pure,' the best plan is to exclude entirely all glaring coarsenesses and immoralities, but especially immoralities, for the tone of a book has far more influence than its language; and *Don Juan* has done incalculably more harm than the grossest phraseology of Christian-hearted, moral, though rude-tongued Shakspeare. Afterwards, let the young creatures read everything, and take their chance. In that evil world which one sickens at their ever knowing, and yet they must know it and fight through it, as their Maker ordains, or He would never have put them into it—the best safeguard is, not total ignorance of vice, but the long habitual practice and love of virtue.

Into that world—across the enchanted ocean of which our pilot was the benevolent bookseller, who, I trust, under this anonymous, and through the oblivion of years, may yet recognise his own good deed—we children quickly passed. Therein, our readings, like our doings, concern nobody but ourselves, so that I will no longer continue the chronicle.

It will, however, have served some purpose, if in its literal facts, it carries any suggestions to either reading-children or their parents, during what may be called the *cacothles legendi*; when toys delight not, plays weary, playmates are quarrelled with, and the sole cry from morning till night is, 'I want something to read.'

TRIAL BY ORDEAL IN THE NINETEENTH CENTURY.

ABOUT ten years ago, I was a jolly sub in the—regiment Bengal native infantry, commonly known through the presidency by the name of the 'Ugly Mugs;' a facetious general having told us once that he never inspected a smarter or an uglier corps in his life. We were ordered to a remote station south of the Nerbudda, much nearer either Madras or Bombay than Calcutta, and since then very wisely transferred to the former presidency. On arriving there, in the beginning of the hot weather, I found bungalows scarce and dear, and was only too glad to meet an old friend (the artillery subaltern in charge of post guns), who offered to sell me half his bungalow, and, better still, give me long *tick* for the payment. I accordingly accepted the offer, breathing a mental prayer that Plutus, as represented by the secretary of the Agra Bank, might be propitious when the time of payment came. There were no troops in the station except our own corps, which, between staff appointments and detachments, was very weak in officers. We were cut off from all the amusements and amenities of civilised life. Our billiard-table was useless, as the two centre slabs, after receiving sundry compound fractures, reposed quietly at the bottom of a nullah. Even that last resource of the miserable matrimony, was denied us, there being neither spinster

nor chaplain within two hundred miles. The latter could be dispensed with, as the commanding officer of an outpost is like the captain of a ship, and can unite couples as firmly as the Gretna blacksmith or the Archbishop of Canterbury; but there was no getting over the want of the former.

Under these trying circumstances, most corps would have taken to quarrelling amongst themselves, at which, by the way, the ladies are generally the first to begin, and the last to leave off; but the Ugly Mugs, although very fond of their grumble, disliked fighting with any one except John Company's natural enemies. Some took to horticulture, and constructed gardens which cost a great deal, and produced very little; others displayed their architectural tastes by erecting primitive mansions of wattle and dab—that is, bamboos and mud, roofed with grass, the whole being finished without a single nail or bit of iron being used in it.

My chum, whose name was Caldwell, and I, took to studying the black classics, Persian and Hindustani, vigorously, eschewing tiffin-parties, sporting excursions, and everything else that threatened to interfere with our obtaining the goal of our wishes—namely, attaching that magic P. to our names in the Army List, which signifies passed interpreter's examination; but, bearing in mind *nec semper arcum tendit Apollo*, we relieved our literary labours with various intellectual amusements, such as slaying squirrels and lizards with the pellet-bow, educating our dogs and monkeys, destroying wasps' nests by squibs attached to the end of a bamboo, and hunting mungooses. I leave it to philologists to decide on the correct plural of that word; I never could. Our zeal for study lasted all through the hot weather and rains, but, with the cold weather, a change came o'er the spirit of our amusements—squirrel and mungooses revelled in conscious security, the wasp had as peaceful a house as his own bad temper would permit, and our monkey's education was neglected like our own; our time was divided between shooting and fishing excursions, rifle-matches and pigeon-shooting, besides which we taught the sepoy cricket, and played officers and men of right wing against those of left wing. This afforded capital sport, and, unlike most other amusements, cost little—a small subscription from each defrayed the expense of bats, balls, leveling the ground, &c. I was requested to receive and collect this, which I did on pay-day, the only time when cash-transactions take place.

Being late in the evening when I received it, I placed the amount, about sixty rupees, in my writing-desk, which always remained open on my table; and as I believed my servants to be honest, and thought no one saw me put it there, I considered it safe enough for the present. On looking for it next morning, the cash was gone, and along with it a few trinkets and all the papers in the desk, some of which were of great consequence to me. It was quite evident that a servant or some one well acquainted with the house had taken it, as an ordinary thief would have taken desk and all without waiting to abstract its contents; besides which, he would doubtless have left other traces of his visit, as a pair of valuable pistols and a silver match-box lying on the same table would have excited his cupidity. My suspicions lit upon a cock-eyed bearer of Caldwell's, to whom I had a strong objection. He certainly was a most sinister-looking individual, and, if not a rogue, his countenance lay open to an action for defamation of character.

Caldwell, on the other hand, felt quite sure that my *dhobie* was the thief, as all the servants declared he was the only person who had entered the room that evening, when he brought in the clean clothes. I don't like speaking in an unknown tongue, but

that word *dhobie* is an indubitable and unmitigated staggerer; it means a 'male washerwoman,' and I know of no word in the English language which expresses that. We were both so positive that, for the first time in our life, we had an angry discussion about it. At length we decided on calling our servants together—about twenty in all—and telling them we were certain the thief was one of themselves, and that we would accordingly deduct the entire amount stolen proportionably from their wages. They were at once assembled in the verandah, and I made them a short speech, announcing our determination. This was touching them on the tenderest point, and all were in the midst of loud protestations of their innocence, when in walked Ajudiah. He was a small spare man, but being a high-caste Brahman, and having held the office of regimental pundit for a quarter of a century, he was greatly respected by the men. He had the reputation of being very learned, and had scraped together a large sum of money, as, in addition to his regimental salary, he levied large contributions from the sepoy in his priestly capacity, and gave instructions in Hindee and Sanscrit. Caldwell and I had been pupils of his, and he now came ostensibly to make salam, but really to remind us that we owed him a small balance. On learning the state of affairs, he said: 'Defender of the poor! protector of the oppressed! it is easy to pronounce judgment, but between judgment and justice a wide difference exists. It cannot be concealed from the brilliant light of your penetrating mind, that if you act as you propose, all your servants will suffer equally with the guilty one. I have no doubt, if such be your pleasure, that, with the aid of my own skill and your good-fortune, I can discover the individual who has been faithless to his salt.' I have always had a most profound contempt for the Brahmans and their transparent humbug; but thinking that fear of detection might induce the culprit to confess, I gravely assented, and said I should feel much obliged by his coming next morning soon after sunrise, to make his investigation.

I had not the slightest expectation that it would be successful, but I thought it might be some amusement, and at mess that evening I mentioned it to my brother-officers, and invited them to come and see the fun.

We were hardly seated at coffee the next morning when Ajudiah made his appearance, and asked permission to commence his experiments. This being graciously accorded, he began by seating all the servants on a *chabootra* or raised platform of masonry, in front of the bungalow. He then seated himself in the middle, with a brass dish containing undressed rice at one side, and a pair of small scales and weights at the other. After mumbling a few prayers and stretching out his hands several times over the rice with the palms open and the knuckles uppermost, like a person warming his hands at a fire, he commenced operations by doling out to each servant a rupee's weight of the dry rice. He used a peculiar kind of rupee (the *shahnimalhee*) for this purpose. As each man's portion was weighed out, it was placed on a piece of plantain leaf, about six inches square, and deposited in his lap by a young Brahman, who was Ajudiah's *chaila* or disciple. When all had received their quantum, he stood up, and stretching out his hands to the four quarters of heaven, as if invoking the judgment of the Deity, desired them to commence, whereupon all hands took their portion of rice in their mouths, and began chewing away vigorously. While this was going on, the Brahman took up his rosary, made of the beautiful brown berries of the *Melia Azedorachta*, and appeared quite absorbed in prayer and meditation, though I have no doubt the

cunning old rogue kept a sharp look-out all the time.

After this lasted a couple of minutes, he gave the signal to cease, and all immediately returned their portion of rice to their leaf, with a profusion of those disgusting and unearthly sounds which only a native of India can produce.

He then went round and inspected the contents of each leaf, a most uninviting spectacle, I must confess, for in all, the rice was thoroughly masticated and saturated with saliva. On my asking which was the guilty one, he replied: 'Mighty sir, under your favour, all these men are innocent.' I said: 'I feel sure some of the servants is the thief, and they are not all present?' No one replied; and on looking again I observed that my khidmutgar was absent. I did not in the least suspect him, as I considered him a very respectable man; he came to me with a very high character from his former master, and during the two years he had been in my service had fully maintained it. However, as I thought that in justice none should be exempted, I desired him to be summoned. He came, after a little delay, and excused his absence by saying he had been busy in the cook-house preparing coffee. I noticed that the man's manner was different from his usual composed and almost dignified way of speaking, but thought it might arise from his repugnance as a Mussulman to have intercourse with a Brahman.

The man sat down amongst the other servants, and took his prescribed portion of rice without further remark.

Feeling sure of the result, I paid no further attention to their proceedings, until Caldwell exclaimed: 'I say, P——, your old kit will sprain his teeth and dislocate his upper jaw if he goes on much longer like that.' I then observed that the khidmutgar was making frantic efforts to chew, his entire head and body moving with the exertion; the pundit standing near and encouraging him with such words as: 'Use your strength, my brother; why should the innocent fear God's judgment.' This went on for a few minutes, when the khidmutgar was desired to return the rice into his leaf. He did so, and it appeared as dry as when it went into his mouth; the grains seemed slightly crushed, but not broken, nor was there a particle of saliva adhering to them. The pundit then said: 'This man's guilt is manifest; he dare not deny what all the gods declare so evidently.' The khidmutgar's countenance certainly exhibited all the marks of guilt and confusion. A native has one advantage, that if he blushes, it cannot be seen, and 'de non existentibus et non apparentibus eadem est ratio,' but though, when under the influence of fear or rage, he does not exactly grow pale, his face assumes somewhat of the hue of an unripe lemon.

Such was the case in the present instance. He stood before me with his hands closed in the attitude of prayer, unable to look in my face, and trembling in every limb. I then told him I felt sure he was the thief, and discharged him on the spot, with forfeiture of all wages due. I sent for the *choudry* or head-man of the bazaar, and had his hut and boxes examined, but nothing was found; we searched his person with no better success; and he was resuming his turban with a triumphant air, when I perceived a suspicious-looking lump on the pendent end of it. The knot was opened, and disclosed a small bit of paper about four inches square, which proved to be a *hoondee* or letter of credit for the exact sum I had lost, drawn by a *shroff* or native banker, and dated the previous day, being the one after the robbery. This was proof not to be withstood, and they were marching him off to jail, when he asked to speak to me in private. I took him a little apart, when he said, if I promised not to send him to the magistrate, he would restore

the cash. This I promised; when he confessed that he was in his *bottle khana*, or pantry, when he saw me put the money into my desk, and that while I was at mess the devil prompted him to steal it. The other things he concealed in a lot of fowls' feathers behind the cook-house, where we found them.

I will now leave it to physiologists to decide how fear, or the consciousness of guilt, acting on the salivary glands, can make them refuse to perform their usual office. I never saw the experiment repeated, nor did I ever hear of its being performed before a European, although I understand the native *punchayets* (courts of arbitration) frequently make use of it.

What made it more extraordinary in the present instance was, that the convicted person was a Mohammedan, and therefore unlikely to be influenced by the superstitious fear with which a Hindoo regards a Brahman. Of course all the servants attributed it to the efficacy of the ceremonies performed by so holy a man, and we formed various conjectures on the subject. The surgeon gave us a most scientific elucidation, which left us no wiser than before; and Lieutenant East assured us, that whenever he disappointed at all he felt a dryness in his mouth the following morning; that probably it would be much worse if he stole anything, but could not tell till he tried: and as I never heard of his essaying the experiment, I cannot tell my readers the result.

THE LIGHT QUESTION.

Our age may be characterised as one of great developments; it may also be said to be one of great revolutions—in other terms, developments succeed each other so rapidly, that each revolutionizes the preceding.

Reflection on this subject might be followed into many details: let me confine myself to one only, in the present paper, and speak of what has been done, and is yet to do, in that department of industry and economics which is connected with the lighting of our houses, streets, warehouses, and shops in this northern latitude.

When I was a boy, all this was done by the combustion of animal and vegetable oils in one shape or another. Miserable as was the lighting of the streets, it must still have consumed a vast quantity of oil; and, considering that oil still bears a high price, after its complete ejection from use on the grand scale, it seems quite inconceivable how we could have had it supplied in sufficient quantity for our present purpose, had not this application of gas been discovered. Even now, with our countless millions of gas-burners in the streets and shops, and the ever-increasing use of the same illuminator in private dwellings, the price of candles goes on rising; and if we could but estimate how many tons of oil and tallow are nightly represented by our total gas-consumption, we should probably feel overwhelmed by the question, What should we have done without gas?

It is true that turnips for cattle-feeding are now grown, where rape, for the sake of its oil, might in old times have found a preference; but the tendency of this change must be to increase the supply of meat, and also that of animal oil in another form. A very high price for oil would no doubt stimulate its production; but the discovery of a cheap and inexhaustible mineral substitute has tended to the growth of corn and cattle-feeding crops on the surface of the soil, instead of oil-bearing ones, and thus indirectly conferred vast benefits upon the community.

One reason for the high price of oils, in spite of the competition of gas, is, no doubt, the extensive use of that material in lubricating our machinery; and here I am reminded of another interesting development.

Some years ago, the substance familiar to us as palm-oil was commercially unknown; it is now imported in amazing quantity, and is the general lubricator employed for the axles of our railway-carriages. The consumption of it in this way must be enormous; and it is hardly going too far to say, that, had it not been discovered in time, a very serious difficulty would have arisen in reference to railway locomotion. I verily believe that every particle of fat now converted into soap and candles for the use of the poor and trading classes, would have been required for the purposes of the railway, and those absolute necessities of life been unprocureable at any price within the limits of ordinary means. Not only, then, has this wonderful and most providential supply of oleaginous matter conferred immense benefits on the countries from which we derive it—being to them a 'development' of the utmost importance—but it has also done for us, in the way of lubrication and soap-boiling, what gas has done in the lighting department; and while the latter has saved us from darkness, the former has prevented our being driven to the expedient I once knew a foreigner adopt in travelling—that is, wearing black linen shirts instead of white ones—and has protected us from coming to a 'dead-lock' upon the iron road.

But now we come to revolutions. No sooner is something, newly discovered and painfully elaborated, fairly established as a 'development,' than something else is brought forward which threatens its supremacy. Every one has heard of the Irish bogs. They differ in no essential quality from the 'mosses' of England and Scotland, being a vegetable mould of greater or less density, according to the drainage-fall—composed chiefly of gigantic moss in a state of compression and partial decomposition. In Ireland, there are vast tracts of this peat-moss or 'bog,' and it is now some years since certain new facts respecting it were brought to light under the all-scrutinising eye of modern chemistry. That it could be made to furnish a sort of grease capable of making candles, &c., was proved, and the O'Gorman Mahon produced in parliament some specimens of the manufacture. At that time, however, the matter could only be regarded as a scientific fact of much interest, but of no practical utility, on account of the great expense of production. Perhaps, however, it may have reached the ears of the honourable gentleman that some Saxon had said that Irish members were 'not fit to hold a candle' to their more accomplished co-senators of the sister-land, and he merely wished to shew in a practical manner that this was not the case.

Be this as it may, we learn with great satisfaction that by the recent substitution of sulphuric acid, a cheap and abundant material, for ether—a rare and dear one—this oleaginous matter, technically called *paraffine*, may be procured at a very much cheaper rate; so much so, that there is now every prospect of this curious substance being brought into general use as a means of artificial light, with, no doubt, a general benefit to the community.

Assuming, then, that we may look forward with confidence to this new development, and that it will revolutionise the present régime of extravagant prices, the question arises: What is the extent of the resource thus opened up? The existing 'surveys' enable us to answer this question. The bogs of Ireland cover an area of nearly *three million acres*. The average depth is somewhere about twenty feet; so that while many smaller mosses of only a few miles' circumference will, no doubt, rapidly disappear, it will take a long time before so vast a mass of

material will be wrought out. In a few years, this will admit of approximate calculation; at present, it would be idle to offer even a conjecture on the subject.

There is this consolation attendant on the cutting out of the Irish bogs: at present, these three million acres are practically useless, except in affording a small supply of fuel, rendered every day less important by the railway facilities for the transport of coal. When cut away, the land will be recovered; and although, in many instances, the bog is underlaid by gravel only, yet generally the mixture of this with some residuum of the peaty matter will form a useful soil, while, in other places, clays and loams of various quality will be brought to light. Thus a great national benefit will be secured in return for the loss of the candle-supply, whenever the day comes that the bogs shall be literally burned out. As paraffine seems destined thus to take rank alongside of gas and palm-oil, it may be worth while to dwell for a moment on an examination of its nature and properties.

That wonderful substance, carbon, which can exist in so many different forms, visible and invisible, and which forms a large portion of all organised matter, must be the basis of paraffine, as it is of the vegetable substances from which that matter is extracted.

Everything of vegetable origin which is inflammable owes that quality to carbon, in whatever way the combustion may be called into play. Carbon has great affinity for other substances, mineral and vegetable, and its recovery from combination with them, and its reproduction in the form desired by the operator, is the great object of this as of so many other processes of chemistry. Thus the carbonaceous matter contained in the peat may be easily dissipated by heat, and made to pass off in the form of smoke or flame. It is by submitting large quantities of it to distillation, and *condensing the smoke* into a sort of *tarry* substance, that the object in view is attained in the case before us. This tar is treated with sulphuric acid, being, as we are informed, boiled for half an hour with 3 per cent. of the acid. It thus becomes decomposed, and the paraffine and oil remain on the top, while the impurities fall to the bottom of the vessel. These, again, are separated by distillation; the oil, I presume, being the more volatile of the two, is carried over, and the paraffine remains in brown crystalline flakes, already capable of being made into candles, but emitting a smell so disagreeable that it has to undergo a further process of bleaching and deodorisation. This process is gone through by the aid of powerful hydraulic presses, steam-baths, and the action of chloro-chromic acid. After this, the desired product comes forth clean and odourless, and capable of making drawing-room lights equal to those of the finest wax.

It might perhaps be suggested that a cheaper sort of candle, suitable to the poor man's cottage, might be made from the paraffine in its less purified state, and with the same amount of profit to the company. At all events, there is nothing unwholesome, but much the contrary, in the smell of tar in combustion, and it would not offend the nasal sensibilities of the peasantry, to whom the cheap light would be a real blessing. In any case, the supply of superior candles will necessarily ease the pressure on the market for the material which is now so extensively converted into stearine for that purpose. Thus, reflectively, the poorer customer will, it is to be hoped, become a gainer; and it is comfortable to think that this has been the tendency of all modern improvements and developments.

Independently of the light question, which is our main object, the peat is capable of conversion into other useful things besides paraffine. Thus, we are told, a black pigment of superior quality is one

of its constituents; and the gaseous matters, as well as the oil, separated in the distillation, are reserved for separate and useful purposes.

Another very interesting development in alliance with the present subject demands a brief notice before I conclude.

Some years ago, a spring of mineral oil was discovered in Derbyshire by Mr James Young of Manchester. This oil was applied with advantage as a lubricator in the factories there; but the supply ceased just as the value of the substance was becoming known. This put Mr Young upon the 'daring quest' of an artificial oil which should answer the same purposes, and his success is considered as one of the greatest discoveries of the age. It appears that this oil is the product of the distillation of coal at a low temperature. It is, in fact, gas in another form, and realises the apparently paradoxical idea of Baron Liebig, who put forward some years ago, as an object to be greatly desired, that coal-gas could be produced in a tangible form, and burnt without smell or other inconvenience in a candlestick or lamp! Ordinary gas emits so much sulphur in combustion, that it cannot safely be employed as a light in closed rooms, however well ventilated: this discovery of a paraffine oil, procurable at an easy rate from coal, must be hailed as one of the greatest importance; and in connection with the subject of light from decomposed peat, must be looked upon as likely to complete the revolution of our entire system, greatly to the promotion of comfort and economy.

This new substance is called 'patent paraffine oil;' and we are informed that one gallon of it, at a cost of 3s. 8d., will yield as much light as twenty-two pounds of the best sperm-candles. It differs also, in a very important particular, from 'camphine' and various other oils, in being inexplosive. If these facts did not rest upon most respectable authority, I should scarcely feel warranted in helping to give them publicity; but as they are endorsed by men of mark in the scientific world, there can be little, if any, doubt that at least the greater part of what is promised will be realised; and even after some deductions, enough will remain to justify our most sanguine anticipations of a new era in respect of light and lubrication.

NOTHING TO WEAR.*

We count our Comic Prose Writers in these days by the score, like oysters; but of really humorous Versifiers there is not so much as one among us. Mr Browning, indeed, in his famous burial of that too erudite volume in the hollow rotten tree, has exhibited a prodigious and unexpected power of Fun; but one comic poem does not make a comic poet, any more than one swallow a summer. Our modern Hood, it seems, is to be looked for—in the words of one of those popular songs which we are obliged to consider jocular in default of anything better—'on the other side of the water;' and his name and address, as we understand, is William Allen Butler of New York.

This gentleman, although labouring under the truly transatlantic delusion that *pattern* rhymes harmoniously with *satin*, is by no means a contemptible poet, and a very genuine humorist indeed. His satire is rollicking and natural, and he is not ashamed to be pathetic when his subject seems to demand a line from the heart.

Miss Flora MacFlimsey, of Madison Square—who is a type of the fashionable female world at present

gone stark mad upon the subject of over-dressing—has been, the bard affirms, no less than three journeys to Paris for the sole and express purpose of shopping. Her friend, Mrs Harris, and herself, have spent

Six consecutive weeks without stopping
In one continuous round of shopping;
Shopping alone, and shopping together,
In all hours of the day, and in all sorts of weather;
For all manner of things that a woman can put
On the crown of her head, or the sole of her foot,
Or wrap round her shoulders, or fit round her waist,
Or that can be sewed on, or pinned on, or laced,
Or tied on with a string, or stitched on with a bow,
In front or behind, above or below:
For bonnets, mantillas, capes, collars, and shawls;
Dresses for breakfasts, and dinners, and balls;
Dresses to sit in, and stand in, and walk in;
Dresses to dance in, and flirt in, and talk in;
Dresses in which to do nothing at all;
Dresses for winter, spring, summer, and fall;
All of them different in colour and pattern,
Silk, muslin, and lace, crape, velvet, and satin,
Brocade and broadcloth, and other material,
Quite as expensive, and much more ethereal;
In short, for all things that could ever be thought of,
Or milliner, modiste, or tradesman be bought of,
From ten-thousand-franc robes to twenty-sous frills;
In all quarters of Paris and to every store,
While MacFlimsey in vain stormed, scolded, and swore,
They footed the streets, and he footed the bills.

And yet though scarce three months have passed since the day

This merchandise went in twelve carts up Broadway,
This same Miss MacFlimsey of Madison Square,
The last time we met was in utter despair,
Because she had nothing whatever to wear.
Nothing to wear! Now, as this is a true ditty,
I do not assert—this, you know, is between us—
That she's in a state of absolute nudity,
Like Power's Greek slave or the Medici Venus;
But I do mean to say that I've heard her declare,
When at the same moment she had on a dress
Which cost five hundred dollars, and not a cent less,
And jewellery worth ten times more, I should guess,
That she had not a thing in the wide world to wear!

We are sure that these noble lines of Mr W. A. Butler will find an echo in the bosom of every man who is a father or a husband. We ourselves, who have been married long enough to know better than to make remonstrance upon any subject, did leave this little volume by accident upon our dressing-table—carefully wrapped up as though it were something that was private and not to be seen—with the very best results, we are bound to confess, to the person for whose perusal it was thus cunningly devised. But the wife of our bosom is reasonable, and even manageable with tact, and a very different young woman, we flatter ourselves—barring the crinoline—from Miss Flora MacFlimsey, who bestows on the poet, 'after twenty or thirty rejections,' those 'fossil remains which she called her affections.'

And that rather decayed, but well-known work of art, Which Miss Flora persisted in styling her 'heart.' So we were engaged. Our troth had been plighted Not by moonbeam or starbeam, by fountain or grove, But in a front parlour, most brilliantly lighted. Beneath the gas fixtures we whispered our love, Without any romance, or raptures, or sighs, Without any tears in Miss Flora's blue eyes, Or blushes, or transports, or such silly actions; It was one of the quietest business transactions, With a very small sprinkling of sentiment, if any, And a very large diamond imported by Tiffany.

These two engaged young persons are asked to the Stickup's ball, and the youth is speaking of his

* *Nothing to Wear. An Episode of Fashionable Life.* Sampson Low and Son. 1853.

anticipated delight in introducing this charmer as his own to a so brilliant assembly, when, to his great surprise,

The fair Flora looked up with a pitiful air, And answered quite promptly: 'Why, Harry, *mon cher*, I should like above all things to go with you there; But, really and truly—I've nothing to wear!'

The crimson brocade, the pink, the blue silk, the tulle on satin, the brown moire antique, the pearl coloured, the lilac, 'that sweet mazarine,' are each in turn suggested by the lover as 'something to wear,' and each rejected with disdain; at last, the conversation having verged on the quarrelsome, he is himself rejected by Miss MacFlimsey; and in a very fit frame of mind for such an enterprise, institutes a commission of inquiry into the alleged destitution of these numerous fashionable females who have, as they state, 'nothing to wear.' Among the statistics he mentions the following interesting cases:

In one single house on the Fifth Avenue, Three young ladies were found all below twenty-two, Who have been three whole weeks without anything new

In the way of flounced silks; and thus left in the lurch, Are unable to go to ball, concert, or church.

In another large mansion, near the same place, Was found a deplorable, heart-rending case, Of entire destitution of Brussels point lace.

In a neighbouring block, there was found, in three calls, Total want, long-continued, of camels'-hair shawls;

And a suffering family, whose case exhibits The most pressing need of real ermine tippets;

One deserving young lady almost unable To survive for the want of a new Russian sable;

Another, confined to the house when it's windier Than usual, because her shawl isn't India.

Still another, whose tortures have been most terrific Ever since the sad loss of the steamer *Pacific*,

In which were engulfed, not friend or relation— For whose fate praps she might have found some consolation,

Or borne it, at least, with serene resignation— But the choicest assortment of French sleeves and collars

Ever sent out from Paris, worth thousands of dollars, And all as to style most *recherché* and rare,

The want of which leaves her with nothing to wear, And renders her life so drear and dyspeptic,

That she's quite a recluse, and almost a sceptic; For she touchingly says, that this sort of grief

Cannot find in Religion the slightest relief, And Philosophy has not a maxim to spare

For the victims of such overwhelming despair.

Halting as Mr Butler's metre often is, the easy cantering motion of these few latter lines approaches the as yet unrivalled amble of the *Ingoldsby Legends*. These which follow, and contain the pith of the whole matter, are by no means harmonious, but they have all the spirit of that great master of pathos who gave us the *Song of the Shirt*.

O ladies, dear ladies, the next sunny day, Please trundle your hoops just out of Broadway, From its whirl and its bustle, its fashion and pride, And the temples of trade which tower on each side, To the alleys and lanes, where Misfortune and Guilt Their children have gathered, their city have built; Where Hunger and Vice, like twin beasts of prey, Have hunted their victims to gloom and despair; Raise the rich, dainty dress, and the fine, brodered skirt,

Pick your delicate way through the dampness and dirt, Grope through the dark dens, climb the rickety stair To the garret, where wretches, the young and the old, Half starved and half naked, lie crouched from the cold.

See those skeleton limbs, those frost-bitten feet, All bleeding and bruised by the stones of the street; Hear the sharp cry of childhood, the deep groans that swell

From the poor dying creature who writhes on the floor; Hear the curses that sound like the echoes of hell, As you sicken and shudder, and fly from the door; Then home to your wardrobes, and say, if you dare, Spoiled Children of Fashion, you've nothing to wear!

And oh, if perchance there should be a sphere Where all is made right which so puzzles us here, Where the glare, and the glitter, and tinsel of Time Fade and die in the light of that region sublime, Where the soul, disenchanting of flesh and of sense, Unscreened by its trappings, and shows, and pretence, Must be clothed for the life and the service above, With purity, truth, faith, meekness, and love; Oh, Daughters of Earth! foolish virgins, beware! Lest in that upper realm you have Nothing to Wear!

HOSPITAL-LIFE.

A PRACTICE prevails among certain ingenious shop-keepers in large towns, of presenting those customers whom they look upon as country visitors with a card describing the character of their establishments and position as to railway-stations, hotels, and other central situations of easy access. On the reverse side of this card such local objects are mentioned as might naturally be thought interesting to strangers. Public statues and monuments, the handsomest streets and widest squares, such buildings as the College, Post-office, Town-hall, Theatre, or Art-gallery, are examples of the places so named. I have always observed that among the marked omissions are those buildings in which is led that sombre kind of existence I am about to describe. Nor is this surprising, as places of reception for the sick poor are generally associated in the public mind with scenes of constant suffering and almost hopeless disease. The stranger who stops a passer-by to ask after the large dingy pile, with a scanty grass-plot in front, situated perhaps in one of the meanest localities of a crowded city, rarely exhibits any further curiosity upon hearing that it is a hospital. Even townspeople themselves, familiar from childhood with the figures of sickly men crawling upon crutches about the doors, or with pale faces inside sedan-chairs borne to the wards, may pity, but have no great desire to become acquainted with the existence that is led within those gloomy walls.

We should probably err in ascribing this lack of sympathy as much to indifference as to the effects of incorrect information. Men are not to be judged too harshly if they fail to shew much eagerness in acquainting themselves with distress which they believe they are powerless to remedy. Some, perhaps, may urge their pecuniary contributions to the hospital's funds, as affording exemption from anything additional, while others may justly plead their aptness to be misled by the indiscriminate application of the term hospital. That name is now applied to munificent institutions, doubtless founded for charitable purposes, but not more removed from hospitals proper by their stately architecture than by their ample endowments. It is true that many infirmaries are independent of eleemosynary aid, but others are notoriously poor. We may be pardoned for here observing that it is something of

a reproach to Scotchmen that our national hospital in Edinburgh should belong to the latter class. But that the general indifference we complain of is in some measure culpable, is evident from contrasting the different enthusiasm excited by military and by civil hospitals. For the humblest duties in connection with the former, a countless number of devoted applicants immediately present themselves, ready to incur the risk of infection and the chances of war. Must we suppose that the *éclat* and distinction attendant upon such services have to do with the crowd of eager volunteers that flocked, for example, to the east during the Crimean war? It ought always to be borne in mind, that the one great name associated with Scutari had acquired the practical knowledge which rendered her so eminently useful by the bed-sides of hospitals in her own country.

Instead, however, of a further discussion of such causes, let us content ourselves by stating that a little more active sympathy in behalf of our hospital inmates is urgently called for; and, as we do not know a better way of promoting so desirable an end, we shall offer to our readers a plain uncoloured account of their mode of life. The lot of such persons is not so hopeless as it is often represented, nor is it, at any time, so agreeable as to be independent of many little comforts that ampler means could furnish them with. There are indeed many delicacies agreeable to the capricious appetite of invalids, that the wealthiest hospitals grudge. One benefit, we trust, may result from a truthful description of hospital-life, and that is a removal of a dangerous and far too prevalent prejudice entertained by those for whose relief such institutions were founded and are maintained. As the main features of all are alike, we may add that we have no particular one in view.

Suppose we set off to visit a hospital. On arriving at the gate, we present our order to the porter, who, if satisfied with its authenticity, directs us towards the hall. There we are met by the door-keeper, a person who generally combines two or three subordinate offices in his own person, and is now to act as our guide. In looking round the hall, our attention is attracted by a number of doors alternating with narrow passages. These doors lead, we are told, to the apartments of the different officers of the establishment; as the chaplain, matron, secretary, and resident physicians and surgeons. The passages, again, lead to the dining-room, where those functionaries meet at meals; to the laboratory, where the prescriptions are made up, and to a more pleasant quarter, the kitchen, as well as to wash-houses, laundries, and similar rooms. In our visit to these respective places, we are struck alike with their great cleanliness, the tidiness of the servants, and the quiet manner in which the discipline of so large an establishment is maintained. Not a corner do we come upon but we are met with a current of fresh air; indeed, the ventilating arrangements are so complete, that in any other place we should be inclined to find fault with them.

Now, thus far, we have seen nothing to indicate the peculiar character of the institution. We might have been inspecting the ground-floor of a wealthy college or a great monastery, so complete is the order and so extensive are the culinary preparations. But

our guide is turning up stairs, and presently we are ushered into a ward full of invalids. A ward, it may be necessary to state, is an oblong apartment, with a lofty ceiling, bare white walls, and an uncarpeted floor. The patients lie upon iron bedsteads, without, of course, any curtains, at considerable distances apart. This is an ordinary medical ward we have entered—devoted to general diseases, as of the lungs, heart, and other internal organs. The number of patients may be about twenty. They are in all stages of disease, some under acute affections, trembling, as it were, between life and death; in one or two perhaps the fatal change is too clearly visible—but the majority are out of danger, and present the unmistakable hue of health returning to their wasted cheeks. We observe that over every bedstead is affixed a slate, on which are inscribed the patient's name, age, birthplace, and the character of his diet, whether it is to be low or stimulant. At either end of the ward are wide grates, in which huge fires constantly blaze; these are intended as much for ventilation as for warmth. A group of more advanced convalescents, dressed in the plain livery of the hospital, are gathered round the fire. These are all impatiently waiting the order for dismissal; for, though admission be, the gate cerberus permits no one to pass him without a formal medical discharge.

Two small apartments adjoining the ward attract our attention, and upon inquiring, we are informed that one of these is a withdrawing-room, for the use of the physician at his daily visit; while the other is occupied by a patient requiring more quiet than the wards, noiseless as they are, permit. The former is furnished in strict accordance with the prevailing economical spirit of the house. A table, supporting a microscope and some test-tubes, occupies the centre of the room. A couple of chairs, a wash-hand stand with basin and towel, and a hat-peg, include the remaining articles. We are next shewn into a similarly sized and adjoining room, as neatly, but somewhat more liberally furnished. In the open cupboard we see a row of plates, cups, and saucers; while a bright kettle sings merrily on the hob. A small shelf near the bed is appropriated to a dozen or two of volumes. These, we are informed, are often in great demand in the ward. There are a few pictures on the wall, of doubtful excellence, in an artistic point of view, but probably representing the lineaments of the favourite divine of the occupant, side by side with her defunct husband. For it is the sanctum of one of the nurses we have invaded, and these persons are nearly all widows. We ought to add, that instead of being, as they are often represented, hard-hearted and ill-tempered, nurses, as a class, are very sympathising, and cheerfully manage the correspondence of such patients as require to communicate with their homes through the post, and are unable to write.

We have now finished our survey of one ward and its adjoining apartments. There may be twenty, thirty, fifty other wards, but as they are all alike, we may content ourselves with that just visited. The same bare walls and high roofs, the same rows of little phials by every bedside, and the same tin tumblers in the windows, are found alike in all. We have still, however, to be made acquainted with the internal management of the institution.

In the morning, an hour or so before breakfast, the great bell rings, for the first time, to awaken cooks and to relieve night-nurses. Soon afterwards arrive the baker's, butcher's, and milkman's carts with the provision for the day. Meanwhile, up stairs the nurses are busy in the different wards, assisting such

patients as are able to rise and dress, and washing the hands and faces of weaker invalids. The resident medical officer now comes round to hear how the patients have slept, and if there have been any fresh admissions through the night. When the great bell rings again, the nurses learn that breakfast is ready, and repair to the kitchen. In a short time they return, bearing trays laden with tea and coffee, eggs, rolls, and toast. It is not unpleasant, we are told, to watch the general excitement created by the arrival of these good things in the ward. Almost every patient addresses himself with a keener relish to his morning meal than to any other. Breakfast over, the ward speedily regains its usual quiet; now and then there is a little gossip going on between two or three patients at the fireside; but in general they are silent, not only from the presence of some sufferers who must not be annoyed by any noise, but from their being strangers to one another, and from all having cares, and possibly heavy hearts, of their own. Many of them are aware that it must go hard with the dear ones at home, now that they are unable to do anything for their support. Some perhaps have come from great distances, seeking for labour, and have suddenly been laid low. Towards eleven o'clock the house-physician pays another visit, and the nurse, at the same time, makes a most careful survey of every bedside, seeing that everything under her charge is neat and clean. She then withdraws, to make her own toilet, for at noon comes off the great event of the day—namely, the visit of the physician. As soon as the half-clock strikes twelve, the nurse reappears with her whitest apron and most capacious cap. Carriage-wheels are now heard pulling up tightly at the gate, and in a minute more, the doctor enters. The great man is immediately surrounded with a crowd of students, and the inspection of the patients commences. Here, it should be mentioned, that hospitals, besides serving as places of reception for the sick, are at the same time medical schools; indeed, the celebrity of a university teaching medicine has always depended much more upon the practice of its hospitals than on the elegance of its lectures. At the same time, no action can be more mistaken than that the care of patients is made subordinate to the purposes of medical education. The physicians and surgeons of public hospitals are all men of professional eminence, who know it is sound sense as well as humanity to treat rich and poor with equal tenderness. To return—the physician, as he passes from bed to bed, is always attended by the nurse and by the resident medical officer, to whom he communicates his instructions, and any change in diet or medicine he may think proper. The concourse of students depends upon the popularity of the teacher. The more eminent clinical professors at Edinburgh, London, and Paris count their followers by hundreds.

At two o'clock the great bell rings again for dinner; this meal varies according to the condition of the patient. Boiled and roast beef and mutton, steak and chops, rice and potatoes, are for convalescents; while others more sickly are restricted to light soups, sago, tapioca, and the like. After dinner, the day passes as quietly as the forenoon did, but towards evening there is a good deal of excitement apparent in the wards. Once a day, for a single hour, the doors of the hospital are opened to admit the friends and relatives of the sick. With no little caution, when the hour for admission arrives, does the gate-keeper let in one visitor after another. The pockets of each are subjected to a rigid examination, in case any contraband articles—a savoury pie or a pint of ale, for example—be carried in to gratify the incessant hunger that attends convalescents from tedious and exhausting diseases. Once within the gate, the visitors disperse, each one making for the bedside that

is dearest to him. We may well believe that the greetings there exchanged are often very sad. The patient may have changed for the worse since yesterday, and the mournful question presents itself, what may not happen by to-morrow? The majority of patients, however, are glad and hopeful, listening fondly to all stories from home, and now impatient to get away. After their visitors retire, a sober supper, about eight o'clock, is the sole interruption to the monotony of a long, long night.

Before concluding this simple sketch of hospital-life, we must not omit a notice of that part of the institution devoted to surgical cases. There is more liveliness generally apparent among the occupants of surgical than of medical wards, unless the unhappy subject of an incurable injury happen to be present. Many of these patients are recovering from an amputation, and are often, by their exuberant spirits, led into musical and lyrical excesses not strictly in accordance with the laws of the establishment. These fellows on their return home will talk of their operation as a soldier does of his first fire, and, indeed, will all their lives be fond of surgical gossip. There was wont to be a part of hospital-life never named without a shudder but which now-a-days inspires no such feeling. In former times, men of the strongest nerves shrunk appalled from the scenes in the operating room of a hospital. Such scenes are no longer painful to patient, surgeon, or to spectator. Under the blessed sleep of chloroform, the knife passes unfelt through the most sensitive textures. When we consider that this drug, which has already saved such an incalculable amount of pain, should only have been applied to the treatment of disease eleven winters ago, are we not justified in hoping that there are other provisions in nature equally beneficent which we may have the good-fortune some day to discover?

Let us conclude by pointing out a defect in all our hospitals, as buildings, that might be easily remedied. At present, the walls of both medical and surgical wards—with the exception of those devoted to ophthalmic affections—are of an unvarying white colour, presenting no object whatever for the tired eyes of the poor sufferers to rest upon. The commonest house-paper bearing the similitude of a tree, a flower, or a river, would surely be more suggestive of pleasure than a blank wall. It is true that many hospital inmates are not persons of cultivated taste, but the eye of the least educated individual would not fail to turn to any object that suggested ideas different from those which long confinement to a sick-bed tends to produce.

O C E O L A :

A ROMANCE.

CHAPTER LXIV.—A BANQUET WITH A BAD ENDING.

As by duty bound, I delivered a report of the scene I had involuntarily been witness to. It produced a lively excitement within the fort, and an expedition was instantly ordered forth, with myself to act as guide.

A bit of sheer folly. The search proved bootless, as any one might have prophesied. Of course, we found the place, and the bodies of those who had fallen—upon which the wolves had already been ravaging—but we discovered no living Indians—not even the path by which they had retreated!

The expedition consisted of several hundred men—in fact, the whole garrison of the fort. Had we gone out with a smaller force, in all probability, we should have seen something of the enemy.

* * * *

The death of Omatla was the most serious incident that had yet occurred; at all events, the most important in its bearings. By the whites, Omatla had been constituted king: by killing, the Indians shewed their contempt for the authority that had crowned him, as well as their determination to resist all interference of the kind. Omatla had been directly under the protection of the white chiefs: this had been guaranteed to him by promise as by treaty; and therefore the taking his life was a blow struck against his patrons. The government would now be under the necessity of avenging his death.

But the incident had its most important bearings upon the Indians, especially upon Omatla's own people. Terrified by the example, and dreading lest similar retribution might be extended to themselves, many of Omatla's tribe—sub-chiefs and warriors—forsook their alliance, and enrolled themselves in the ranks of the patriots. Other clans that had hitherto remained undecided, acting under similar motives, now declared their allegiance to the national will, and took up arms without further hesitation.

The death of Omatla, besides being an act of stern justice, was a stroke of fine policy on the part of the hostile Indians. It proved the genius of him who had conceived and carried it into execution.

Omatla was the first victim of Oçoola's vow of vengeance. Soon after appeared the second. It was not long before the tragedy of the traitor's death was eclipsed by another, far more thrilling and significant. One of the chief actors in this drama disappears from the stage.

On our arrival at the fort, it was found that the commissariat was rapidly running short. No provision had been made for so large a body of troops, and no supplies could possibly reach Fort King for a long period of time. We were to be the victims of the usual improvidence exhibited by governments not accustomed to warlike operations. Rations were stinted to the verge of starvation; and the prospect before us began to look very like starvation itself.

In this emergency, the commander-in-chief performed an act of great patriotism. Independent of his military command, General Clinch was a citizen of Florida—a proprietor and planter upon a large scale. His fine plantation lay at a short distance from Fort King. His crop of maize, covering nearly a hundred acres, was just ripening; and this, without more ado, was rationed out to the army.

Instead of bringing the commissariat to the troops, the reverse plan was adopted; and the troops were marched upon their food—which had yet to be gathered before being eaten.

Four-fifths of the little army were thus withdrawn from the fort, leaving rather a weak garrison; while a new stockade was extemporised on the general's plantation, under the title of 'Fort Drane.'

There were slanderous people who insinuated that in this curious matter the good old general was moved by other motives than those of mere patriotism. There were some talk about 'Uncle Sam'—well known as a solvent and liberal paymaster—being called upon to give a good price for the general's corn; besides, so long as an army bivouacked upon his plantation, no danger need be apprehended from the Indian incendiaries. Perhaps these insinuations were but the conceits of camp satire.

I was not among those transferred to the new station; I was not a favourite with the commander-in-chief, and no longer upon his staff. My duties kept me at Fort King, where the commissioner also remained.

The days passed tamely enough—whole weeks of them. An occasional visit to Camp Drane was a relief to the monotony of garrison-life, but this was a rare occurrence. The fort had been shorn of its strength, and was too weak for us to go much beyond its walls. It was well known that the Indians were in arms. Traces of their presence had been observed near the post; and a hunting excursion, or even a romantic saunter in the neighbouring woods—the usual resources of a frontier station—could not have been made without some peril.

During this period I observed that the commissioner was very careful in his outgoings and incomings. He rarely passed outside the stockade, and never beyond the line of sentries. Whenever he looked in the direction of the woods, or over the distant savanna, a shadow of distrust appeared to overspread his features, as though he was troubled with an apprehension of danger. This was after the death of the traitor chief. He had heard of Oçoola's vow to kill Omatla; perhaps he had also heard that the oath extended to himself; perhaps he was under the influence of a presentiment.

Christmas came round. At this season, wherever they may be found—whether amid the icy bergs of the north, or on the hot plains of the tropic—on board ship, within the walls of a fortress—ay, even in a prison—Christians incline to merry-making. The frontier post is no exception to the general rule; and Fort King was a continued scene of festivities. The soldiers were released from duty—alone the sentinels were kept to their posts; and, with such fare as could be procured, backed by liberal rations of 'monnongahela,' the week was passing cheerily enough.

A 'sutler' in the American army is generally a thriving adventurer—with the officers liberal both of cash and credit—and, on festive occasions, not unfrequently their associate and boon-companion. Such was he, the sutler, at Fort King.

On one of the festal-days, he had provided a sumptuous dinner—no one about the fort so capable—to which the officers were invited—the commissioner himself being the honoured guest.

The banquet was set out in the sutler's own house, which, as already mentioned, stood outside the stockade, several hundred yards off, and nearer to the edge of the woods.

The dinner was over, and most of the officers had returned within the fort, where—as it was now getting near night—it was intended the smoking and wine-drinking should be carried on.

The commissioner, with half-a-dozen others—officers and civilian visitors—still lingered to enjoy another glass under the hospitable roof where they had eaten their dinner.

I was among those who went back within the fort. We had scarcely settled down in our seats, when we were startled by a volley of sharp cracks, which the ear well knew to be the reports of rifles. At the same instant was heard that wild intonation, easily distinguishable from the shouting of civilised men—the war-cry of the Indians!

We needed no messenger to inform us what the noises meant: the enemy was upon the ground, and had made an attack—we fancied upon the fort itself.

We rushed into the open air, each arming himself as he best could.

Once outside, we saw that the fort was not assailed; but upon looking over the stockade, we perceived that the house of the sutler was surrounded

by a crowd of savages, plumed and painted in full fighting costume. They were in quick motion, rushing from point to point, brandishing their weapons, and yelling the *Yo-ho-chee*.

Straggling shots were still heard as the fatal gun was pointed at some victim endeavouring to escape. The gates of the fort were standing wide open, and soldiers, who had been strolling outside, now rushed through, uttering shouts of terror as they passed in.

The sutler's house was at too great a distance for the range of musketry. Some shots were discharged by the sentries and others who chanced to be armed, but the bullets fell short.

The artillerists ran to their guns; but on reaching these, it was found that the stables—a row of heavy log-houses—stood directly in the range of the sutler's house—thus sheltering the enemy from the aim of the gunners.

All at once the shouting ceased, and the crowd of dusky warriors was observed moving off towards the woods.

In a few seconds they had disappeared among the trees—vanishing, as if by magic, from our sight.

He who commanded at the fort—an officer slow of resolve—now mustered the garrison, and ventured a sortie. It extended only to the house of the sutler, where a halt was made, while we contemplated the horrid scene.

The sutler himself, two young officers, several soldiers and civilians, lay upon the floor dead, each with many wounds.

Conspicuous above all was the corpse of the commissioner. He was lying upon his back, his face covered with gore, and his uniform torn and bloody. Sixteen bullets had been fired into his body; and a wound more terrible than all was observed over the left breast. It was the gash made by a knife, whose blade had passed through his heart.

I could have guessed who gave that wound, even without the living testimony that was offered on the spot. A negress—the cook—who had concealed herself behind a piece of furniture, now came forth from her hiding-place. She had been witness of all. She was acquainted with the person of Opeola. It was he who had conducted the tragedy; he had been the last to leave the scene; and before taking his departure, the negress had observed him give that final stab—no doubt in satisfaction of the deadly vow he had made.

After some consultation, a pursuit was determined upon, and carried out with considerable caution; but, as before, it proved fruitless: as before, even the track by which the enemy had retreated could not be discovered!

CHAPTER LXV.

'DADE'S MASSACRE.'

This melancholy finale to the festivities of Christmas was, if possible, rendered more sad by a rumour that shortly after reached Fort King. It was the rumour of an event, which has since become popularly known as 'Dade's massacre.'

The report was brought by an Indian runner—belonging to one of the friendly clans—but the statements made were of so startling a character, that they were at first received with a cry of incredulity.

Other runners, however, continuously arriving, confirmed the account of the first messenger, until his story—tragically improbable as it appeared—was accepted as truth. It was true in all its romantic colouring; true in all its sanguinary details. The war had commenced in real earnest, inaugurated by a conflict of the most singular kind—singular both in character and result.

An account of this battle is perhaps of sufficient interest to be given.

In the early part of this narrative, it has been mentioned that an officer of the United States army gave out the vaunt that he 'could march through all the Seminole reserve with only a corporal's guard at his back.' That officer was Major Dade.

It was the destiny of Major Dade to find an opportunity for giving proof of his warlike prowess—though with something more than a corporal's guard at his back. The result was a sad contrast to the boast he had so thoughtlessly uttered.

To understand this ill-fated enterprise, it is necessary to say a word topographically of the country.

On the west coast of the peninsula of Florida is a bay called 'Tampa'—by the Spaniards, 'Espiritu Santo.' At the head of this bay was erected 'Fort Brooke'—a stockade similar to Fort King, and lying about ninety miles from the latter, in a southerly direction. It was another of those military posts established in connection with the Indian reserve—a dépôt for troops and stores—also an entrepôt for such as might arrive from the ports of the Mexican gulf.

About two hundred soldiers were stationed here at the breaking out of hostilities. They were chiefly artillery, with a small detachment of infantry.

Shortly after the fruitless council at Fort King, these troops—or as many of them as could be spared—were ordered by General Clinch to proceed to the latter place, and unite with the main body of the army.

In obedience to these orders, one hundred men, with their quota of officers, were set in motion for Fort King. Major Dade commanded the detachment.

On the eve of Christmas, 1835, they had taken the route, marching out from Fort Brooke in high spirits, buoyant with the hope of encountering and winning laurels in a fight with the Indian foe. They flattered themselves that it would be the first conflict of the war, and therefore that in which the greatest reputation would be gained by the victors. They dreamt not of defeat.

With flags flying gaily, drums rolling merrily, bugles sounding the advance, cannon pealing their farewell salute, and comrades cheering them onward, the detachment commenced its march—that fatal march from which it was destined never to return.

Just seven days after—on the 31st of December—a man made his appearance at the gates of Fort Brooke, crawling upon his hands and knees. In his tattered attire could scarcely be recognised the uniform of a soldier—a private of Dade's detachment—for such he was. His clothes were saturated with water from the creeks, and soiled with mud from the swamps. They were covered with dust, and stained with blood. His body was wounded in five places—severe wounds all—one in the right shoulder, one in the right thigh, one near the temple, one in the left arm, and another in the back. He was wan, wasted, emaciated to the condition of a skeleton, and presented the aspect of one. When, in a weak trembling voice, he announced himself as 'Private Clark of the 2d Artillery,' his old comrades with difficulty identified him.

Shortly after, two others—privates Sprague and Thomas—made their appearance in a similar plight. Their report was similar to that already delivered by Clark: that Major Dade's command had been attacked by the Indians, cut to pieces, massacred almost to a man—that they themselves were the sole survivors of that band who had so lately gone forth from the fort in all the pride of confident strength, and the hopeful anticipation of glory.

And their story was true to the letter. Of all the detachment, these three miserable remnants of humanity alone escaped; the others—one hundred and six in all—had met death on the banks of the Amazura. Instead of the laurel, they had found the cypress.

The three who escaped had been struck down and left for dead upon the field. It was only by counter-foisting death, they had succeeded in afterwards crawling from the ground, and making their way back to the fort. Most of this journey Clark performed upon his hands and knees, proceeding at the rate of a mile to the hour, over a distance of more than sixty miles!

CHAPTER LXVI.

THE BATTLE-GROUND.

The affair of Dade's massacre is without a parallel in the history of Indian warfare. No conflict of a similar kind had ever occurred—at least, none so fatal to the whites engaged in it. In this case they suffered almost annihilation—for, of the three wounded men who escaped, two shortly after died of their wounds.

Nor had the Indians any great advantage over their antagonists, beyond that of superior cunning and strategy.

It was near the banks of the Amazura,* and after crossing that stream, that Major Dade's party had been attacked. The assault was made in ground comparatively open—a tract of pine-woods, where the trees grew thin and straggling—so that the Indians had in reality no great advantage either from position or intrenchment. Neither has it been proved that they were greatly superior in numbers to the troops they destroyed—not more than two to one; and this proportion in most Indian wars has been considered by their white antagonists as only 'fair odds.'

Many of the Indians appeared upon the ground mounted; but these remained at a distance from the fire of the musketry; and only those on foot took part in the action. Indeed, their conquest was so soon completed, that the horsemen were not needed. The first fire was so deadly, that Dade's followers were driven into utter confusion. They were unable to retreat: the mounted Indians had already outflanked them, and cut off their chance of escape.

Dade himself, with most of his officers, fell at the first volley; and the survivors had no choice but to fight it out on the ground. A breastwork was attempted—by felling trees, and throwing their trunks into a triangle—but the hot fire from the Indian rifles soon checked the progress of the work; and the parapet never rose even breast-high above the ground. Into this insecure shelter the survivors of the first attack retreated, and there fell rapidly under the well-aimed missiles of their foes. In a short while the last man lay motionless; and the slaughter was at an end.

When the place was afterwards visited by our troops, this triangular enclosure was found, filled with dead bodies—piled upon one another, just as they had fallen—crosswise, lengthwise, in every attitude of death!

It was afterwards noised abroad that the Indians had inhumanly tortured the wounded, and horribly mutilated the slain. This was not true. There were no wounded left to be tortured—except the three who escaped—and as for the mutilation, but one or two instances of this occurred—since known to have been the work of runaway negroes actuated by motives of personal revenge.

Some scalps were taken; but this is the well-known custom of Indian warfare; and white men ere now have practised the fashion, while under the frenzied excitement of battle.

I was one of those who afterwards visited the battle-ground on a tour of inspection ordered by the commander-in-chief; and the official report of that

tour is the best testimony as to the behaviour of the victors. It reads as follows:

'Major Dade and his party were destroyed on the morning of the 28th of December, about four miles from their camp of the preceding night. They were advancing in column of route when they were attacked by the enemy, who rose in a swarm out of the cover of long grass and palmettoes. The Indians suddenly appeared close to their files. Muskets were clubbed, knives and bayonets used, and parties clinched in deadly conflict. In the second attack, our own men's muskets, taken from the dead and wounded, were used against them; a cross-fire cut down a succession of artillerists, when the cannon were taken, the carriages broken and burned, and the guns rolled into a pond. Many negroes were in the field; but no scalps were taken by the Indians. On the other hand, the negroes, with hellish cruelty, pierced the throats of all whose cries or groans showed that there was still life in them.'

Another official report runs thus:

'We approached the battle-field from the rear. Our advanced-guard had passed the ground without halting, when the commanding officer and his staff came upon one of the most appalling scenes that can be imagined. We first saw some broken and scattered boxes; then a cart, the two oxen of which were lying dead, as if they had fallen asleep, their yokes still on them: a little to the right, one or two horses were seen. We next came to a small enclosure, made by felling trees, in such a manner as to form a triangular breast-work. Within the triangle—along the north and west faces of it—were about thirty bodies, mostly mere skeletons, although much of the clothing was left upon them. They were lying in the positions they must have occupied during the fight. Some had fallen over their dead comrades, but most of them lay close to the logs, with their heads turned towards the breastwork, over which they had delivered their fire, and their bodies stretched with striking regularity parallel to each other. They had evidently been shot dead at their posts, and the Indians had not disturbed them, except by taking the scalps of some—which, it is said, was done by their negro allies. The officers were all easily recognised. Some still wore their rings and breastpins, and money was found in their pockets! The bodies of eight officers and ninety-eight men were interred.

'It may be proper to observe that the attack was not made from a hommock, but in a thinly wooded country—the Indians being concealed by palmettoes and grass.'

From this report, it appears that the Indians were fighting—not for plunder, not even from motives of diabolical revenge. Their motive was higher and purer—it was the defence of their country—of their hearths and homes.

The advantage they had over the troop of Major Dade was simply that of ambush and surprise. This officer, though a man of undoubted gallantry, was entirely wanting in those qualities necessary to a leader—especially one engaged against such a foe. He was a mere book-soldier—as most officers are—lacking the genius which enables the great military chieftain to adapt himself to the circumstances that surround him. He conducted the march of his detachment as if going upon parade; and by so doing he carried it into danger and subsequent destruction.

But if the commander of the whites in this fatal affair was lacking in military capacity, the leader of the Indians was not. It soon became known that he who planned the ambush and conducted it to such sanguinary and successful issue, was the young chief of the Baton Rouge—Oceola.

He could not have stayed long upon the ground to enjoy his triumph. It was upon that same evening

* 'Outhlaccochee' of the Seminoles.

at Fort King—forty miles distant from the scene of Dade's massacre—that the commissioner fell before his vow of vengeance!

CHAPTER LXVII.

THE BATTLE OF QUITLACOOCHIE.

The murder of the commissioner called for some act of prompt retribution. Immediately after its occurrence, several expresses had been despatched by different routes to Camp Drane—some of whom fell into the hands of the enemy, while the rest arrived safely with the news.

By daybreak of the following morning the army, more than a thousand strong, was in motion; and marching towards the Amazura. The avowed object of this expedition was to strike a blow at the families of the hostile Indians—their fathers and mothers, their wives, sisters, and children—whose lurking-place amidst the fastnesses of the great swamp—the 'Cove'—had become known to the general. It was intended they should be captured, if possible, and held as hostages until the warriors could be induced to surrender.

With all others who could be spared from the fort, I was ordered to accompany the expedition, and accordingly joined it upon the march. From the talk I heard around me, I soon discovered the sentiment of the soldiery. They had but little thought of making captives. Exasperated by what had taken place at the fort—further exasperated by what they called 'Dade's massacre,' I felt satisfied that they would not stay to take prisoners—old men or young men, women or children, all would alike be slain—no quarter would be given.

I was sick even at the prospect of such a wholesale carnage as was anticipated. Anticipated, I say, for all confidently believed it would take place. The hiding-place of these unfortunate families had become known—there were guides conducting us thither who knew the very spot—how could we fail to reach it?

An easy surprise was expected. Information had been received that the warriors, or most of them, were absent upon another and more distant expedition, and in a quarter where we could not possibly encounter them. We were to make a descent upon the nest in the absence of the eagles; and with this intent the army was conducted by silent and secret marches.

But the day before, our expedition would have appeared easy enough—a mere exciting frolic, without peril of any kind; but the news of Dade's defeat had produced a magical effect upon the spirits of the soldiers, and whilst it exasperated, it had also cowed them. For the first time, they began to feel something like a respect for their foe, mingled perhaps with a little dread of him. The Indians, at least, knew how to kill.

This feeling increased as fresh messengers came in from the scene of Dade's conflict, bringing new details of that sanguinary affair. It was not without some apprehension, then, that the soldier marched onward, advancing into the heart of the enemy's country; and even the reckless volunteer kept close in the ranks as he rode silently along.

About mid-day we reached the banks of the Amazura. The stream had to be crossed before the Cove could be reached, for the vast net-work of swamps and lagoons bearing this name extended from the opposite side.

A ford had been promised the general, but the guides were at fault—no crossing-place could be found. At the point where we reached it, the river ran past broad, black, and deep—too deep to be waded even by our horses.

Were the guides playing traitor, and misleading

us? It certainly began to assume that appearance; but no—it could not be. They were Indians, it is true, but well proved in their devotion to the whites. Besides, they were men compromised with the national party—doomed to death by their own people—our defeat would have been their ruin.

It was not treason, as shewn afterwards—they had simply been deceived by the trails, and had gone the wrong way.

It was fortunate for us they had done so! But for this mistake of the guides, the army of General Clinch might have been called upon to repeat on a larger scale the drama so lately enacted by Dade and his companions.

Had we reached the true crossing, some two miles further down, we should have entered an ambush of the enemy, skilfully arranged by that same leader who so well understood his forest tactics. The report of the warriors having gone on a distant expedition was a mere ruse, the prelude to a series of strategic manœuvres devised by Ocoela.

The Indians were at that moment where we should have been, but for the mistake of the guides. The ford was beset upon both sides by the foe—the warriors lying unseen like snakes among the grass, ready to spring forth the moment we should attempt the crossing. Fortunate it was for Clinch and his army that our guides possessed so little skill.

The general acted without this knowledge at the time—else, had he known the dangerous proximity, his behaviour might have been different. As it was, a halt was ordered; and, after some deliberation, it was determined we should cross the river at the point where the army had arrived.

Some old boats were found, 'accows,' with a number of Indian canoes. These would facilitate the transport of the infantry, while the mounted men could swim over upon their horses.

Rafts of logs were soon knocked together, and the passage of the stream commenced. The manœuvre was executed with considerable adroitness, and in less than an hour one half of the command had crossed.

I was among those who got first over; but I scarcely congratulated myself on the success of the enterprise. I felt sad at the prospect of being soon called upon to aid in the slaughter of defenceless people—of women and children—for around me there was no other anticipation. It was with a feeling of positive relief, almost of joy, that I heard that wild war-cry breaking through the woods—the well-known Yo-ho-eh-ee of the Seminoles.

Along with it came the ringing detonations of rifles, the louder report of musketry; while bullets, hisling through the air, and breaking branches from the surrounding trees, told us that we were assailed in earnest, and by a large force of the enemy.

That portion of the army already over had observed the precaution to post itself in a strong position among heavy timber that grew near the river-bank; and on this account the first volley of the Indians produced a less deadly effect. For all that, several fell; and those who were exposed to view were still in danger.

The fire was returned by the troops, repeated by the Indians, and again answered by the soldiers—now rolling continuously, now in straggling volleys or single shots, and at intervals altogether ceasing.

For a long while but little damage was done on either side; but it was evident that the Indians, under cover of the underwood, were working themselves into a more advantageous position—in fact, surrounding us. The troops, on the other hand, dared not stir from the spot where they had landed, until a larger number should cross over. After that, it was intended we should advance, and force the Indians from the covert at the point of the bayonet.

The troops from the other side continued to cross.

Hitherto, they had been protected by the fire of those already over; but at this crisis a manœuvre was effected by the Indians, that threatened to put an end to the passing of the river, unless under a destructive fire from their rifles.

Just below our position, a narrow strip of land jutted out into the stream, forming a miniature peninsula. It was a sand-bar caused by an eddy on the opposite side. It was lower than the main bank, and bare of timber—except at its extreme point, where a sort of island had been formed, higher than the peninsula itself. On this island grew a thick grove of evergreen trees—palms, live-oaks, and magnolias—in short, a hommock.

It would have been prudent for us to have occupied this hommock at the moment of our first crossing over; but our general had not perceived the advantage. The Indians were not slow in noticing it; and before we could take any steps to hinder them, a body of warriors rushed across the isthmus, and took possession of the hommock.

The result of this skillful manœuvre was soon made manifest. The boats, in crossing, were swept down by the current within range of the wooded islet—out of whose evergreen shades was now poured a continuous stream of blue fiery smoke, while the leaden missiles did their work of death. Men were seen dropping down upon the rafts, or tumbling over the sides of the canoes, with a heavy plunge upon the water, that told they had ceased to live; while the thick fire of musketry that was directed upon the hommock altogether failed to dislodge the daring band who occupied it.

There were but few of them—for we had seen them distinctly as they ran over the isthmus—but it was evident they were a chosen few, skilled marksmen every man. They were dealing destruction at every shot.

It was a moment of intense excitement. Elsewhere the conflict was carried on with more equality—since both parties fought under cover of the trees, and but little injury was sustained or inflicted by either. The band upon the islet were killing more of our men than all the rest of the enemy.

There was no other resource than to dislodge them from the hommock—to drive them forth at the bayonet's point—at least this was the design that now suggested itself to the commander-in-chief.

It seemed a forlorn-hope. Whoever should approach from the land-side would receive the full fire of the concealed enemy—be compelled to advance under a fearful risk of life.

To my surprise, the duty was assigned to myself. Why, I know not—since it could not be from any superior courage or ardour I had hitherto evinced in the campaign. But the order came from the general, direct and prompt; and with no great spirit I prepared to execute it.

With a party of rifles—scarcely outnumbering the enemy we were to attack at such serious disadvantage—I started forth for the peninsula.

I felt as if marching upon my death, and I believe that most of those who followed me were the victims of a similar presentiment. Even though it had been a certainty, we could not now turn back; the eyes of the whole army were upon us. We must go forward—we must conquer or fall.

In a few seconds we were upon the island, and advancing by rapid strides towards the hommock. We had hopes that the Indians might not have perceived our approach, and that we should get behind them unawares.

They were vain hopes. Our enemies had been watchful; they had observed our manœuvre from its beginning; had faced round, and were waiting with rifles loaded, ready to receive us.

But half conscious of our perilous position, we pressed forward, and had got within twenty yards of the grove, when the blue smoke and red flame suddenly jetted forth from the trees. I heard the bullets shower past my ears; I heard the cries and groans of my followers, as they fell thickly behind me. I looked around—I saw that every one of them was stretched upon the ground, dead or dying!

At the same instant a voice reached me from the grove:

'Go back, Randolph! go back! By that symbol upon your breast your life has been spared; but my braves are chafed, and their blood is hot with fighting. Tempt not their anger. Away! away!'

SUMMER WIND.

THE low wind through my casement strays,
Between the jasmine's parted leaves,
Soft whispering through the morning rays,
And rippling o'er the golden sheaves.
I hear its low voice far away,
Where silver willows fringe the pool;
And from the forest still and gray,
Its murmur rises fresh and cool.

Leaving the sunny world below
The jasmine's starry buds to seek,
I feel it gently clasp my brow,
And lightly play upon my cheek.
That lingering hand sweeps round the room,
O'er dark recess and quiet nook,
Through loose leaves rustling in the gloom,
And wandering down my open book.

Nor voiceless doth it from me sweep,
To seek the bright free world again;
And in my bosom thrilling deep,
An echo answers to its strain,
That mocks the lonely toll of books,
And whispers me away—away!
Where waving leaves and rushing brooks
Are glancing in the long bright day.

Away above the green earth's breast,
Away above the blue deep wave,
Whose billows, in their hoarse unrest,
Chant o'er the sailor's shroudless grave;
Where silver sails gleam far and white,
And beckon in the moon's cold ray—
The wild wind following on their flight,
Still whispers me away—away!

H. R.

ARTIFICIAL COAL.

A curious communication, by M. Baroulier, has been sent in to the Academy of Sciences, describing a method for obtaining a substance possessing all the properties of coal. It is a fact generally admitted by geologists, that coal is the result of the carbonisation of vegetable matter by heat under a strong pressure, and under circumstances calculated to impede the escape of their volatile ingredients. M. Baroulier proceeds in a similar manner; he envelops vegetable matter in wet clay, and exposes it for a considerable length of time to a great pressure, and to a heat of between 200 and 300 degrees centigrade (or the melting-points of tin and bismuth nearly). Various kinds of saw-dust, subjected to this treatment, yielded different substances, possessing more or less the resinous lustre and colour of coal, and burning with a bright flame.—*Newspaper paragraph.*

DROPPING AN ACQUAINTANCE.

PERHAPS, reader, thou didst never chance to have a too highly respectable acquaintance; if so, pass on without perusing this experience, and thank thy stars that thy life has been so fortunate. Many persons, more particularly those who 'move in the first circles,' and those, upon the other hand, whose lines have fallen in the back-yards of life among the oyster-shells and broken ginger-beer bottles—the Alphas and the Omegas of society—are never troubled with a single too highly respectable acquaintance. It is the youth of the middle-classes, among whose ranks I had myself the misfortune to be born, who alone suffer in this respect, and for the most part without hope of remedy. This dreadful Scourge is generally of an age varying from forty-five to sixty, and has almost always, as he is continually telling us, enjoyed the friendship of our father. 'I was your father's friend, sir, for many years; I knew him, sir, before you were born or thought of; I wish you may be half so good a man as he;' are sentences which our too highly respectable acquaintance carries about with him, as it were, phylactery-wise, or embroidered upon the borders of his garments, so that, meeting him, it is quite impossible to escape from them. I am inclined to allow—for I would be charitable even with an Incubus—that he takes upon himself the triple functions of guide, philosopher, and friend, in the first instance at least, from a kindly motive; but afterwards, when he merges all these attributes in the Unmitigated Bore, he has no such humane feeling, but watches our young eyes grow dim, our young mouth open despairingly, our entire being collapse beneath his withering influence with a hideous joy. It is impossible that he can be ignorant of what he is doing in this respect. The serpent, who, after having lubricated his victim, takes the head of him into its mouth, must needs be aware of its own intention of swallowing him, however tedious the process may be, and however great a distance his fore-doomed heels may project at the commencement of the operation; and our Bore is intelligent enough to know that likewise. This cruelty is generally the single crime of our too highly respectable acquaintance: he is a man, I regret to say, without any one of the pleasant vices except, perhaps, that of over-dining; and even this, since he rarely asks us to dine with him, he might, as far as we are concerned, just as well be without. He often, however, invites us to drop in and take a glass of wine in a friendly way, after he has concluded his repast. If we don't go, he tells us on the ensuing day that he is afraid we do not find him the good

company he always strives to be to young men, and begs us never to miss a pleasanter invitation for the mere sake of coming to listen to an old Twaddle like him; by which means he, of course, irrevocably binds us to his fatal mahogany, upon the next occasion of his asking us thither. 'An old Twaddle!' Think of our too highly respectable acquaintance venturing to make use of such a phrase as that! The very term which defines his too respectable self to a hair! What hope can there possibly be of this dear old gentleman's reformation, when he can employ such an expression as that with the most callous indifference, and without one shadow of self-reproach! If, on the other hand, we go to this wine-party—which consists of himself and ourself, although there is a glass always placed for the chance (another of his absurd self-complacences) of somebody else voluntarily 'dropping in' and joining us—the port, we confess, is old and excellent, but the conversation—that is to say, the monologue, the endless narration of anecdote—is not new either, but partakes of what has been not ill termed the 'fine old crusted' character. There is some story of his, in connection perhaps with the calling out of the Rutlandshire Yeomanry in 1826—'Or, let me see, would it be in '26 or '27?' (he never gets this right by any chance), which we have probably heard nearly one hundred times. When we enter the room, he is surprised to see us not in full dress; he does not care about such things himself, in the least, but he thinks that not dressing is a bad habit; he may be old-fashioned, and even antiquated, but that is his opinion; all which he, however, prefaces with 'My very dear young friend,' the lubrication which I have above referred to as being practised by the great serpent family. Presently, and after a story or two, our too highly respectable acquaintance, with a shadow of paleness observable upon his usually glowing countenance, inquires whether we ever do such a thing as smoke tobacco? The first time this occurs, we hasten, under the delusive impression that he is about to offer us some grateful sedative, to affirm that we do, and are extremely fond of doing it. Upon which he replies that he is truly grieved to hear it, and that the very smell of tobacco about the clothes or hair—'And, my dear young sir, you must excuse me if I liken you at present to the Fitcher, a very intense description of polecat'—always makes him exceedingly unwell. Our too highly respectable acquaintance, who is never rude, treads, indeed, upon the very borders of unpoliteness in respect of this matter, until we solemnly promise that he shall not have cause to find fault with us again. There is no end to the deep influence which this sort of person

may obtain in the mind of a youth by diligent boring; and if it were always to be exercised in the anti-tobacco direction, there would perhaps be little cause to regret it.

He, however, seldom rests satisfied until he has separated us from the companions of our own age and choice; made us engage a seat for a term of years at his particular chapel; withdrawn us from our own profession, and placed us in the office of one of his relatives who generously receives us without premium, but gains at the same time our gratuitous services for an indefinite time; and finally married us to his niece, after which we cease to be responsible beings, and only by the visibly increased importance of our too highly respectable acquaintance—the external swelling of the monster consequent upon the total absorption of its victim—announce our own existence at all.

I first met with my own Mentor, who may very well stand for a type of all his class, at a great Whitebait dinner at Blackwall. I was a lad then only just escaped from school, and of course entirely ignorant of how to conduct myself aright at such a solemnity. Instead of husbanding my magnificent appetite in the proper manner, I actually commenced operations by going twice to Turtle as well as to the iced Punch which goes along with it, like music with words. A reverend sage, however, portly and dignified, but with an eye which seemed benign, who sat on my right hand, interposed judiciously, and arrested for the time what would have been—and was eventually—a very serious catastrophe.

'Young man,' said he, in unctuous but impressive tones, 'beware of what you do. Appetite, a gift vouchsafed by the gods to youth, and to youth alone (he sighed), is a talent which, misapplied and recklessly wasted, is almost worse than apathy to food. There is many a man of matured judgment who would have given twice the cost per head of this entertainment—and that will not be less than three guineas, if so little—for the power which you have just been manifesting with regard to that soup. But consider what is to follow; think of the Future, my dear young friend, and *guide yourself at all times by the carte*. See here, what an enormous distance—no less than five courses off—is that whitebait which we are nominally assembled here to eat. Does the prudent rider, however confident of his generous steed, urge it to full career at the first beginning of the race, or, far less, compel it to surmount any fence a second time? Be temperate, my dear young friend, and restrain your natural impetuosity, or, take my word for it, you will be exceedingly ill.'

My highly respectable acquaintance spoke like a book; his prophecy was not unfulfilled. The last thing which I remember, before I succumbed to the various unaccustomed influences of that whitebait feast, was the spectacle of this gentleman refreshing the tips of his ears by means of a napkin dipped in rose-water—'A device, my young friend, very noteworthy, as oftentimes renewing the enjoyment of food when your case would seem otherwise hopeless.'

I have reason to suspect that, upon the golden grace-cup being handed round on that occasion, I behaved myself somewhat indecorously, and instead of bowing in a stately manner to my opposite neighbour over the goblet, that I put its cover on the top of my head after the Chinese manner, and winked at him. My highly respectable acquaintance hinted at least at something of the sort next day, but blandly added that, being touched with my youth and inexperience, he had made it right with the company. From that moment the yoke was placed upon my neck. This terribly bland old gentleman, with all his faults and weaknesses, became my Old Man of the Sea. Ridicule itself in vain attempted to shake the throne of my

tyrant. My once familiar friend, Dick Wildotes, discovered to me the following incident in the past life of my self-constituted guardian, in the vain hope that such a knowledge would set me free. He told me that Mr Pawkins—which was my too highly respectable acquaintance's inoffensive title—was called by his equals—although I did not then believe in the existence of such persons—'Presence-of-mind Pawkins;' and he also told me why. My Mentor never narrated the anecdote in my hearing, but, as I am given to understand that he has often done so with much complacency, there is no harm in my retailing it.

Mr Pawkins, then, was once in a pleasure-boat with some ladies out at sea, the only male in the company, and one of his fair companions had the misfortune to fall overboard. It must have been long indeed before the crinoline epoch; but something or other of that nature buoyed the unfortunate young woman up, so that she was able to take hold of the boat. This was the opportunity which my too highly respectable acquaintance seized to make himself a name, as above. 'I saw,' said he, 'that the boat was a very frail one; I perceived that the young lady's admission amongst us over the gunwale would very probably upset and drown us all; therefore, although I deeply sympathised with her in her misadventure, I caught hold of an oar, and, with the *greatest presence of mind*, rapped away at her knuckles until she let go.' Wherefore he is well called Presence-of-mind Pawkins until this day. I felt that this was by no means a creditable achievement; but the man was still a hero to me. He had somewhat fanatical views upon religious questions, Dick used to tell me, but I went to my too respectable acquaintance's house of worship for all that. He possessed a great deal of house-property, and had christened an entire street of his 'Agur's Buildings;' instead of calling it after the name of Mr Plumlines, who was the actual architect. 'Agur's prayer,' he observed, 'was for neither riches nor poverty, and these buildings are only for the middling class of people.' I could not but see the vulgarity of this sort of practical piety, but I felt obliged to forgive my eminent house-proprietor even that.

I ascribe my first determined aspirations after freedom to the continuance of the late war in the Crimea; but for that and the unparalleled sufferings to which it exposed me, I might be still bearing my chain; it galled me, however, in such a manner during that epoch, that I was resolved at any hazard to be freed from it. Upon the subject of that campaign, I repeat, my too highly respectable acquaintance out-Pawkinsed Pawkins, bored me beyond the limits of human endurance. Upon every commander, and upon every military movement, he gave an opinion as tedious and as positive as though he had been paid thirty guineas a sheet for it. The late Lord Raglan haunted me like a dreadful phantasm; the very names of Lucan and Cardigan became to me as the beer which has been left in yesterday's tumbler; the bare mention of the *Times*—whose conduct I admired in secret because he hated it—was to my ill-used ears like Cayenne pepper to the back of a flogged soldier. At last, at a little breakfast-party in my own apartments, whither he came, uninvited, to tread upon me, and patronise the rest of the company, he overstepped all limits, and presented me, involuntarily, with my manumission. The conversation having been directed into the usual Crimean channel, my poor friend Wildotes had the temerity to give it as his opinion that the Sebastopol garrison would continue to have provisions supplied to them in abundance.

'What, sir!' roared my too highly respectable acquaintance, chafed with unwonted opposition, 'why, how should that be, when even now, in Archangel,

they are giving for the coarsest wheat *fifteen roubles the chetwort?*

I am not sure about the number; it may have been fifteen or fifty, but I am certain about 'roubles the chetwort.'

'I do not know what a chetwort is,' cried Wildotes angrily, 'and I don't believe that you know either.'

I trembled at the audacity of this young man; but the ground-floor, upon which we happened to be, remained firm beneath us nevertheless; and presently, upon the production of a tobacco-pipe, my too highly respectable acquaintance left his youthful enemy in the possession of the field.

'I congratulate you, my dear fellow,' cried Wildotes as the door closed with rather a slam behind that portly figure—'my friend, you are a free man.'

'Sir,' said I with indignation, 'it is you that are free, and even impertinent. How am I to defend myself, think you, when Mr Pawkins catches me alone?'

My position had indeed become such that no choice remained between bidding an open defiance to my too highly respectable acquaintance, or becoming his cringing slave for the remainder of one of our lives. Wildotes and myself, therefore, having resolved ourselves into a committee of private safety, determined upon a course of action which had for its object the immediate dropping of my philosopher and guide.

Our arrangements being completed, I remained in my own apartment, awaiting his angust presence in a frame of mind far from enviable; not, as I well knew, that he would manifest any signs of anger—his feelings, when irritated, always taking the much more fatal form of injured virtue—but because he would be sure to proceed to absorb me, with a more than usual amount of previous lubrication. 'My dear young friend, in whom I take so great an interest,' and 'the son of my esteemed old friend' (he travelled in the company of my father *once*, in an Islington omnibus), were, as I expected, among the opening expressions of his harangue; then he bewailed my choice of associates, and my habits of extravagance exemplified in having hot meats at breakfast (of which he had partaken, by the by, himself, with considerable relish); he predicted my certain ruin if I continued in these courses instead of sticking to my desk. As he pronounced this prediction, he approached that article of furniture, upon which a small square piece of card was lying, half-covered by a pen-wiper, as though it courted obscurity. This card he took up and waved in his hand, as was his frequent custom, in order to give effect to his oratory. I turned pale with agitation, and protested that it was a private document. Mr Pawkins observed in reply that, considering our mutual relations, there could be no such thing as any privacy in documents, and then perused it with attention.

It was now his turn to grow pale.

'Is it possible, young man,' cried he, when he had quite finished it, 'that this can be *yours*? Have I nourished you in my bosom so long?—'

'Mr Pawkins,' said I, plucking up all my courage, with the knowledge that Wildotes was in the cupboard listening to us, 'you have done nothing of the sort.'

'In my bosom so long,' continued Mentor, as though unconscious of the interruption, 'without rendering you incapable of possessing such a'—

'Sir,' cried I, as he approached the fire with the evident intention of destroying the memorandum, 'that paper is a legal tender; it has a value expressed upon it of three pounds, fourteen shillings, and sixpence: if that is consumed, we shall have to pay the money.'

'*We!*' ejaculated my too highly respectable acquaintance with contempt, but altering his fell purpose nevertheless—"we," young man, did you

say? Miserable, hardened, unprofitable, disreputable profligate, I abandon you for ever.'

My Mentor left the apartment with quite a halo of respectability surrounding the very back of his head.

'Wildotes,' cried I, as the young man burst from his concealment, 'my friend, my benefactor, I will give you a dinner; your ingenious device has saved me from all further persecution; I have dropped for ever my too highly respectable acquaintance!'

And so, in truth, I had; the simple medium of this effectual release having been merely a *paun-broker's ticket*.

In conclusion, I need scarcely add that, in publishing this veracious history, I have no sort of intention of throwing ridicule upon that friendship which is found to exist not seldom between an old man and a youth. Than such a feeling, born of a kindly regard upon the one side, and of an affectionate respect upon the other, there seem to me few things more beautiful. But where there is no real regard, but only officiousness, against which, whatever real respect there be, must needs be sooner or later chafed away, where dictation is in the place of authority, and a spirit of meddling in that of kind solicitude, the spectacle of an unfortunate young man with a too highly respectable acquaintance is pitiable to see.

HISTORICAL SKETCH OF SOLAR SPOTS.

Most persons who have enjoyed the opportunity of looking through a telescope, are probably acquainted with the appearance of the sun as seen magnified through a dark glass, and will agree with our poet-laureate when he says:

The very source and fount of day
Is dashed with wandering isles of night.

These 'wandering isles,' commonly called spots on the sun, especially arrested the attention of astronomers immediately after the invention and use of the telescope, in the beginning of the seventeenth century. The interest which attaches to the history of these appearances is greatly enhanced from the fact, that by means of them the rotation of the sun is conclusively proved. Careful observations of the spots, and of their paths at different times of the year across the sun's disc, give for the period of rotation about 25½ days, and for the inclination of the solar equator to the ecliptic, about 7½°. Occasionally, the spots are sufficiently large to be visible to the naked eye. Galileo, in a letter dated August 1612, mentions that he and many of his friends perceived one, without the intervention of a telescope, on three successive days. A very large one was seen by different persons in April 1764, and again in 1769; and many other instances might be cited, down to 1853, in June of which year one was distinctly seen at sunset. It appears, then, very possible that these phenomena were observed at a much earlier period; and we might expect to discover some notice of them in the annals of different countries. This we find to be the case. The Chinese astronomers relate having observed some spots on the sun in the year 321 of our era; the Spanish conquerors of Peru found that the natives had observed them before their existence was known in Europe. These are almost the only instances of any explicit mention of them; but extraordinary appearances of the sun are found recorded which might perhaps be explained by the presence of a large number of spots. In the annals of France, a historian of the life of Charlemagne relates that, on the 17th day of March 807, the star Mercury was seen on the sun as a small black spot, during eight days. This puzzled Kepler not a little, for he proved satisfactorily that no transit of Mercury could have occurred at that time; he remarked, moreover, that

Mercury would pass over the sun's disc in about seven hours. He removes the difficulty to his own satisfaction by supposing a mistake in the year, and places the occurrence in 808; and for the two Latin words for eight days, he would read a very barbarous one even for monkish Latin, signifying eight times. It is now generally supposed, and with great probability, that the object observed was a spot large enough to be visible to the naked eye. Kepler himself, expecting, towards the end of 1606, or beginning of 1607, a transit of Mercury, was transported with joy at having, as he thought, seen the phenomenon by receiving an image of the sun upon a white surface in a darkened room, a method very generally adopted in those times, before dark glasses were employed; but there can be little doubt that he also was deceived by a spot, for Mercury, when passing before the sun, is much too insignificant an object to be seen without the aid of a telescope.

Much discussion has arisen respecting who was the first to observe the spots with a telescope. There appears little doubt that the first recorded observation was made by Thomas Hariot, an eminent English mathematician. Amongst his papers, the following memorandum has been discovered: '1610 Syon, Decemb: 8, mané. The altitude of the sonne being seven or eight degrees, it being a frost and a mist, I saw the sonne in this manner [a drawing of the telescopic appearance of the sun with three spots on it is added]. I saw it twice or thrise, once with the right ey, and other time with the left. In the space of a minute time after the sonne was to cleare.' Not being acquainted with the use of dark glasses, he was obliged to observe the sun when near the horizon, and through a mist. This may account for his not having again remarked a similar appearance till the following December, when, in common with other astronomers, he became a diligent observer of the spots. The first published account of them with which we are acquainted is by John Fabricius, a German astronomer; it bears the date of June 1611. Impelled by the accounts of Galileo's discoveries, he directed his telescope to the sun. While observing it one day, he noticed what appeared to him a large blackish spot upon its surface. At first, he believed it to be a cloud; but after looking at it ten times with different telescopes, and taking the opinions of others, he recognised its more permanent character. These observations were made when the sun had risen but a few degrees above the horizon; for, being wholly unacquainted with the use of coloured glasses, he was accustomed to look at the sun through the morning mists; and he recommends first admitting a small portion of the sun's disc into the telescope, that the eye may be prepared gradually for the full blaze. But even with these precautions, we are not surprised when he tells us that these observations so affected his vision, that for two days he could see nothing clearly. He passed the following night in great anxiety lest the spot should not be visible in the morning. However, when the sun rose, it was still there; but his perplexity was greatly increased by finding that it had evidently moved its position. It then occurred to him to receive an image of the sun upon a white surface in a darkened room. By this means he was enabled to make more continuous observations, and without endangering his eyesight. He watched the paths of three spots across the sun, and recognised the return of the first, from which he conjectured that it had made a complete revolution. He remarked that the spots decreased in size and moved slower as they receded from the sun's centre, and *vice versa* as they approached it, from which he concluded that they were on the body of the sun, which was spherical and solid. Fabricius hints at its revolution as the true explanation of these move-

ments, but declines giving any decided opinion. The revolution of the sun about its own axis had been already advocated by Kepler in 1609, and therefore before the motion of the spots had been observed; and previously to him, the same opinion had been held by Jordano Bruno, a monk of the Dominican order, who, in 1600, was convicted of atheism and impiety by the inquisition of Venice, and burnt to death. Fabricius, however, seems to have been the first to arrive at the same conclusion from observations of the time of passage of a spot, from which alone any correct results respecting the period of revolution can be deduced.

We may gather from Fabricius's work that he first saw the spots in the beginning of the year 1611, but there is no evidence that he saw them before Hariot; to whom, therefore, is due the credit of having first discovered them, though any one possessed of a telescope might have done the same. But the great contest for priority of discovery was between Galileo and Christopher Scheiner. The latter, a Jesuit, and professor of mathematics at Ingolstadt, first observed the spots in the month of March 1611, while engaged in comparing the apparent diameters of the sun and moon. Thinking lightly of the circumstance, he did not observe the sun again till the following October, when they were again visible. With praiseworthy caution, he, with several friends proved, by using eight telescopes, that these spots could not arise from any defect of vision, or flaws in the glasses.

The progress that science was beginning to make at this time, met with a bigoted opposition from the many admirers of the Aristotelian philosophy, one article in whose creed was the 'incorruptibility of the heavens.' The existence of spots on the sun seemed so directly opposed to this idea of 'incorruptibility,' that Scheiner's provincial refused to sanction the publication of his discovery, which was therefore made known to the world through letters addressed to Marc Velsler, a magistrate of Augsburg, and subscribed 'Apelles post tabulam.'

Galileo asserts that he had shewn spots on the sun to many persons as early as April 1611, and had spoken of them several months previously. This, however, rests wholly upon his own verbal testimony; and it is certain he made no careful observations of them till after the publication of Scheiner's letters. Then, indeed, he proved that they must be on the sun's surface, an idea which Scheiner was perhaps at first afraid to entertain, who pronounced them to be planets revolving about the sun, at a very small distance from the sun. But later, when he had made an incredible number of observations, he abandoned this notion, and adopting Galileo's rotation and the inclination for the period of the sun's revolution, not differing much of the solar equator to the ecliptic, was the first to introduce from the truth. Scheiner, it which had been suggested the use of coloured glasses, and, perhaps actually by Apian as early as 1545, the Batavian sailors employed still earlier by the Dutch, and he discovered taking altitudes of the sun. Moreover, the name of local the small bright points, known by the name of sunspots, seen at all parts of the sun's disc, gave the discovery its appearance; while to Galileo is due the discovery of the bright flakes and streaks, called facule, which are visible at its eastern and western edges, and the parts surrounding the spots. He satisfied himself that they were on the sun, and had the same movement as the spots, and considered that this discovery would set at rest the question of rotation, as no one would object to placing bright spots on the sun! It was to be expected that many conjectures would be made respecting the nature of these phenomena, and the causes which produced them. The opinion that they were bodies revolving about the sun, was entertained by many.

Tarde could not believe it possible that the sun, the eye of the world, could have the ophthalmia, and named them *Borbonia sidera* (Stars of Bourbon); and Malapert, a poet and mathematician, *Austriaca sidera* (Stars of Austria). Galileo frequently likens them to clouds and smoke, and gives a detailed description of a method of producing similar appearances upon a red-hot plate of iron. According to Riccioli, author of a voluminous work on astronomy, Galileo, Kepler, and others believed them to be black substances, as soot or vapours bursting forth from the furnace of the sun; and portions being ignited as sparks, produced the appearance of the faculæ—thus turning Phœbus into Vulcan, as Riccioli remarks. Others held them to be opaque places in space, intercepting the sun's light—holes from which comets had started, and to which they would again return, and the like. Ridiculous as some of these ideas may appear, we are still unable to account for these phenomena by any theory against which many objections might not be urged, though superior telescopes have enabled us to form correcter notions of their general configuration.

The telescopic appearance of a spot is that of a dark nucleus surrounded by a lighter border, but well defined, and not gradually shading off into the nucleus, and in form usually following the irregular shape of the latter. This border is commonly called the *penumbra*, and was first noticed by Scheiner.

Dr Wilson of Glasgow, while observing the course and changes of the great spot of November 1769, noticed that when it was at the centre of the sun, the penumbra surrounded the black nucleus equally on all sides; but he remembered that when he first observed the spot, near the eastern margin, the portion of the penumbra nearest the centre was contracted, there being a marked difference between its breadth and that of the portion nearest the margin, the latter being the broadest. As the spot approached the western limb, he observed the same appearance, the other side of the penumbra now contracting, being the portion nearest the sun's centre; and when close to the margin it wholly disappeared, with a part of the black nucleus. These changes were easily explained by the rules of perspective, supposing the nucleus to be at a considerable depth below the sun's surface, and the penumbra to form the irregular sides of a deep hole, gradually shelving down to the nucleus. This is generally received as the true explanation of the appearance a spot represents, though the facts have been called in question; and it must be confessed that all spots do not exhibit these changes. It is interesting to remark, that the possibility of the spots being large holes, or 'cavernous gulfs,' as he calls them, had occurred to Galileo, though he abandoned the notion at once, as not borne out by the results of his observations.

Much attention is now being given to the physical appearance of the sun, and the positions and number of groups of the spots are carefully noted. The great variety of the forms of spots, and the constant changes that are taking place, are most interesting to watch, and useful as furnishing facts by which we may test the different theories respecting them. The Rev. Mr Dawes has been able to confirm the idea, that the faculæ are heaped-up of the luminous matter. A facula was observed to run nearly parallel to the sun's edge for some distance, and then to turn abruptly towards the edge, and pass over it; this discovery it was seen to project slightly beyond the sun's outline of the limb, in the manner of a ridge. He has also noticed, that at or near the edge of the black nucleus, there is generally a smaller spot, which should properly be called the *sub-spot*. In January 1852, he observed a remarkable

instance of rotatory motion in a spot, the rotation taking place round the small black nucleus. A similar appearance was observed by Professor Secchi, of Rome, in May of last year. Two of the darker nuclei were distinctly seen close to each other, and about these the surrounding portion of the spot; and the penumbra seemed to rotate, the whole presenting the appearance of a whirlpool. Interesting as these facts are, it is from those who are making systematic observations we must expect results which may throw light upon their origin. M. Schwabe, of Dessau, has, since 1826, kept a careful register of the number of new groups that appear each year. By a comparison of his observations, he has found that the number is subject to a periodic recurrence, increasing and decreasing very regularly, coming to a maximum about every eleventh year. The last maximum was in 1848, when 320 groups were observed during the year.

Professor Wolf, director of the Observatory of Berne, by a comparison of all the observations of the spots made from the epoch of their discovery down to the present time, has confirmed the period discovered by M. Schwabe: he has also remarked that this period corresponds with that of the diurnal variation of the magnetic needle in declination, and is now engaged in investigating the periodic recurrence of the Aurora Borealis, from which he hopes to deduce some remarkable results. He has also ascertained that the years during which the spots have been most numerous, have been also the driest and most fertile; thus confirming the opinion of Sir W. Herschel, who contended that the more the luminous matter surrounding the sun was disturbed, the greater would be the heat. As an additional confirmation, we may mention that a great number of spots have been observed this year.

With these results before us, we may hope others will be induced to pursue the subject; and though the rugged surface of the moon will always be a favourite object, we trust enough has been said to shew that there is at least as interesting, and perhaps more fertile, a field for investigation in the varied changes of the solar spots.

THE STORY OF CAMBUSCAN BOLD.

DR JOHNSON once observed, with as much truth as wit, that the persons who most lament the loss of ancient writers often neglect to read those that remain. There is, in fact, a sort of pathos in dwelling upon what has passed for ever out of our reach.

The thing we have, we prize not at its worth;
But being lost, why, then, we reck the value,
And see the good, possession would not shew us
Whilst it was ours.

The history of Chaucer's work supplies a striking illustration of this failing of human nature. Of the *Canterbury Tales*, all are complete but one. Yet our great epic poet, when reviewing in a melancholy mood the rank and file of those whom, if he could, he would have fetched back from the realms of death, passes over without a word the perfect stories, to excite and kindle the imagination by dwelling upon that which has been left unfinished. He discusses the subject with himself, and is in doubt whether he shall unsphere the spirit of Plato, or one of the matchless triumvirate of ancient tragedy, or Mææus, or Orpheus:

Or call up him that left half-told
The story of Cambuscan Bold,
Of Camball, and of Algarsife,
And who had Canace to wife,
That owned the virtuous ring and glass,
And of the wondrous horse of brass,
On which the Tartar king did ride.

From these verses, it is quite clear that Milton had read the *Canterbury Tales* with the eye of a true lover of fiction. What impression Cambuscan Bold might have made upon us, had we been allowed to see the end of him, it is impossible to say; but finding him cut suddenly short in his career, with his two sons, his daughter, and his horse, our curiosity is violently piqued, and we are provoked to throw ourselves out into the vast sea of medieval poetry in search of some one who may help us to the conclusion of the tale.

Our readers, we daresay, remember the King of Bohemia and his Seven Castles, and what annoyance they experienced when, having had the commencement of the story placed more than seven times before them, the writer broke off at last without explaining what it was. To this hour, no one knows what took place in those seven castles; or why the king of Bohemia had just that number, and no more, or what became of him—whether he was married to some beautiful princess, or whether he died as few kings do, in single blessedness. It is quite true that an author of another stamp has undertaken to explain the mystery of the seven castles. But the presumption was as great as his who ventured to continue *Christabel*; and we do not care to get at the knowledge in this surreptitious way. Besides, we feel, while reading the continuation, that we are not conversing with the real magician, but with a sham; and instead of being pleased, we are disgusted accordingly.

No one has had the temerity to attempt the completion of Cambuscan Bold, which is fortunate, as of Chaucer it may truly be said:

Within that circle none durst move but he.

Yet we know that our poet was a great borrower, that he looked abroad over the whole world of literature, and laid hands on whatever suited his purpose. Sometimes he took three or four plots of stories, and melted them down remorselessly into one; sometimes he took the fragment of a plot, and constructed with it a splendid fabric of verse, to endure till doomsday.

It would be curious to discover what was the nature of his proceeding in the present case. Did he find the whole story ready made to his hands; or did he find part of it in one author, and part in another?

A curious manuscript has recently been found in the library of the Arsenal at Paris. It consists of nineteen thousand verses; and the French translator of Chaucer, the *Chevalier de Chatelain*, intends, we believe, to lay it before the public in a modern dress. In obedience, however, to the taste of the day, he will abridge it very much, by leaving out interminable descriptions of tournaments, with other excrescences, and adhering strictly to the story. The author of this voluminous work lived at the court of Mary of Brabant, where, through his superior skill in poetry or flattery, he obtained the appellation of King of the Minstrels. From this terrible production Chaucer is supposed to have derived—in part, at least—the materials of *The Squire's Tale*; but in order to decide how much, we must consider the nature of what has come down to us of the tale itself.

In his magnificent prologue, where all the pilgrim story-tellers are painted to the life, Chaucer gives us a charming description of the narrator of Cambuscan Bold. At the invitation of mine host of the *Tabard*, he comes forward with a modesty inherited from his knightly father, and commences a very wild and exciting romance, which is evidently of eastern origin, the plan, the incidents, the colouring being all Asiatic in their character. The Arab writers of fiction are fond of selecting, for the scene of their tales, the country beyond the great mountain of Kâff, which we denominate Tattary. The very name, to an Oriental, immediately suggests the idea

of magic, strange adventures, and supernatural beings.

The squire plunges at once into the midst of things:

At Samu in the land of Tattary,
There lived a king who warreid Rumia.

This king holds a great feast on the anniversary of his birthday, which, happening to be in the spring, is celebrated also by the music of birds, telling of their own loves and affections. The poet suggests to us a marvellous idea of the vastness of the regal hall. The king sits at the head of the table under a dais; his courtiers and all the nobles of his kingdom—who, we may well suppose, were not a few—are ranged in order about the board, when suddenly, without announcement of any kind, in rides a strange knight, mounted on a horse of brass. Even in Tattary, such an apparition was considered wonderful. But all the astonishment of the guests was not excited by his horse alone: by his side he wore a naked sword, glittering like adamant; on his thumb, a marvellous ring; and in his hand, a mirror, 'all of glass,' which, together with the ring, was designed as a present for Canace, the daughter of the great khan.

When the king and his nobles had sat for some time silent, through amazement, the strange knight from Araby and Inde addressed to Cambuscan an eloquent speech, which, according to the manner of great orators, he accompanied by suitable expressions of countenance. From what he said, we may infer that his master was one of the Abbasside caliphs, whose court was celebrated for learning, and where many men resided, whom their contemporaries believed to be profoundly versed in magical arts. He said he brought the horse, the sword, the ring, and the glass as birthday presents from the sultan of Arabistan and the Indies, to Cambuscan, the great king of Tattary. The steed, he said, would bear the ruler, in the space of twenty-four hours, to the most distant part of the world, dashing through sunshine and showers with the velocity of an eagle. The ring would confer on the person who wore it the power to understand the language of birds, and to converse with them in all their dialects. On this subject, the Arabs and Persians entertain very strange ideas. According to them, birds know much more than we do, so that the way to possess all philosophy is to learn the secret of conversing with them. Their reasons for this belief are highly poetical. Birds, they say, can soar above the clouds, visit the summits of the loftiest mountains, traverse the ocean, explore the cradle of the dawn, and travel with Night, in her blackest attire, over the surface of the earth. They rest on the pinnacles of the highest towers, and thence survey the streets of great cities, watching, while most men sleep, the operations of guilt and crime. They visit the cell of the sage, and by observing his countenance, follow the current of his thoughts, and anticipate the lessons of his wisdom. They sit down with the mother by the cradle of her child, and enjoy the songs with which she hushes it to sleep. They perch in the lover's bower, and are rapt almost into forgetfulness by the music of his vows and sighs. In short, whatever it is, they know.

On this account, a learned Frenchman devoted twenty years of his life to the study of the language of birds, and after all, was supposed to have made but slight proficiency in this wonderful branch of learning.

But the Asiatics have easier methods of accomplishing their designs. Put on a ring, or rub the surface of some precious stone, and you at once comprehend every twitter in the forest.

The magic mirror presented to Canace possessed the most terrible properties—properties which would

make its owner in these days shunned as the plague; for, like poverty, it could reveal whether friends and lovers were false or true.

Messinger had evidently been digging in the mine of Cambuscan Bold, where he found the basis of his play called *The Picture*. What use Chaucer himself would have made of his mirror is more than we can divine, since the story is left half-told. It seems clear, however, that he meant to accomplish strange things with it. But as far as the tale goes, he has made no use of its powers. It is only the virtues of her ring that Canace immediately puts to the proof. Next morning, before the nightingale is silent, the princess, who has had her sleep shortened by excitement, springs eagerly from her couch, rouses half-a-dozen of her women, and issues forth into the park. All nature, she finds, has put on a new aspect; the birds are singing, and every note they utter carries an intelligible meaning to her.

Laying aside the pleasurable, Chaucer, whose great forte is pathos, conducts us to a scene of bitter wailing and lamentation. On a tree which has been stripped of its leaves and bark, and is consequently blanched and withering in the wind, sits a female falcon, which is tearing her breast with her own beak, until the blood falls over the tree in showers, giving between whiles a tongue to her sorrows, in language which she thinks none can understand. To her surprise, Canace approaches and addresses her in her own dialect. We have no space here for the revelations that follow—but the falcon thus sympathised with, pours forth all her grief. It is the old story: the female's faith, and the male's perfidy.

So far of the princess. Cambuscan himself, and his wondrous horse of brass, are rendered equally interesting to the reader. To shew his knowledge of old times, the poet introduces a crowd gathering in the court about the equine marvel. Some of them go back as far as Troy, and speculate on the probability of the magical invention before them containing the nucleus of an army which might emerge from its bowels, and massacre the good people of Sassa in their sleep. These bewildering fancies are put to flight by the coming forth of the khan, the courtiers, and the Arabian cavalier, who explains the mechanism of the enchanted horse, and gives the prince directions for its management in all emergencies. Until touched by the Arab, the steed had stood fixed as a rock of granite to the ground, but then it immediately began to dance and caper, to the astonishment of all who beheld it, and the infinite delight of the Tatar king, who ordered it to be conveyed to the 'master tower' of his palace, and there locked up with a care commensurate to its value.

Here the second part of Chaucer's story breaks off, and, as is his custom, he throws out some hints of what we are to expect in the remainder of the narrative. First, Cambuscan is to win many cities; second, Algarsife is to obtain for his bride the Lady Theodora, of whom, unfortunately, we know nothing more; third, the falcon is to have her lover restored to her; and, fourth, some adventurous knight, whose name, by the carelessness of transcribers, has been confounded with that of Camballo, is to win the hand of the Lady Canace, by overcoming in battle her brethren twain.

From this point forward, we must look beyond Chaucer for the achievements of the horse of brass; and in the manuscript of the library of the Arsenal, the whole cycle of incidents, so far as he is concerned, is complete. But the King of the Minstrels, as he is called, had not the fervid imagination of Chaucer. His story, however, is interesting, his situations are many of them striking, and his characters contrast with each other in a picturesque manner. From this original, our great poet may have borrowed that part

of his relation which belonged to Algarsife; we say, belonged, because we make no doubt that Chaucer had finished the story, and that part of the manuscript has been lost. In the French poet, the owner of the horse is king of Hungary, and a great magician. Like our third Richard, as generally described by historians, he is hunch-backed and malignant; in spite of which, on the mere strength of his enchanted horse, he demands in marriage the most beautiful of three princesses who occupy the place of Canace. The scene at the outset is laid in Spain. Cleomades, who represents Algarsife, resolving to try the powers of the horse, mounts his back, and forthwith shoots up beyond the clouds, where, for a while, he feels rather uncomfortable. Beneath him, he beholds the green plains, the black forests, the meandering rivers, cities, towns, palaces, with the broad blue expanse of the sea. When he becomes tired of his aerial excursion, he touches the magic spring, and immediately his Pegasus plunges down through air, and alights on the summit of a lofty tower. Desiring him to wait there patiently for his return, Cleomades, whose journey has given him a sharp appetite, descends the turret, and presently finds himself in a breakfast-parlour, with all sorts of dainties laid out. He falls to, of course, and thus fortified, proceeds to explore the remainder of the building. In one chamber he finds three ladies asleep; but though he admires their beauty, he has the discretion not to awaken them, and passes on. In the next apartment he finds another sleeping lady, whom he conjectures to be a princess, and stands gazing on her beauty till she wakes. After expressing her natural surprise, the princess—who, in the eastern fashion, is in full attire—consents to walk with him in the palace-garden. They are immediately discovered, and Cleomades is condemned to death. Through the witchery of his eloquence, he prevails upon the king to have his horse brought down from the tower, and to be permitted, in company with the lady, to mount him. The horse is, in this case, of wood, and the courtiers look upon it with ridicule as a toy. While they are indulging in jokes and laughter, Cleomades touches the spring; the horse, in a moment, recovers his vitality, neighs, spurns the ground, and ascends swifter than an arrow into the air, leaving king, queen, courtiers, and maids of honour in overwhelming wonder.

But Cleomades hardly deserves his success—the reason being that if he had, the tale must have closed at once; and therefore, on arriving at his father's palace, he alights in the garden, and with a strange sort of politeness leaves there the steed and the beautiful princess, while he goes to carry the news of his good-fortune to his father and mother. By circumstances over which, as the newspapers say, he had no control, he is detained at the palace longer than he expected.

Meantime, the princess being thus left alone among the trees with a horse of which she did not understand the management, becomes naturally very impatient. At length a messenger from Cleomades appears, a little ill-favoured hunchback, who informs her that Cleomades has been seized with sudden illness, and that he entreats her to come to him immediately in company with his faithful messenger. Suspecting nothing, the lady mounts behind the hunchback, who of course is the magician, the king of Hungary, the sworn enemy of her lover. Instead of going to the palace, therefore, they take to the clouds; and on the way the cavalier makes love to the lady, informing her, after the manner of the *Arabian Nights*, that he has an enchanted palace and gardens in Africa, where she must spend the remainder of her days with him. Being clever as well as beautiful, the princess affects to feel great pleasure

at this idea, but says she is hungry, and would like to descend to *terra firma* for a minute or two, just to get something to eat. The magician, in raptures, consents, and they alight in Italy. Once on the ground, the princess feels her confidence return; and the magician, whose ride in the burning sun has made him hot and thirsty, rushes to a brook to drink. The cold water proves more than a match for his magic; and no sooner has he quenched his thirst, than he drops down, rolls upon the ground, and expires.

The lady now falls into the hands of the Prince of Salerno, who determines upon making her his wife, to prevent which she feigns to be furiously mad, and succeeds so well in her ravings that the ceremony is put off from day to day. As might have been expected, Cleomades does not remain idle all this while; on the contrary, he leaves his father's palace, rides about the world at random, becomes entangled in many adventures; but at length, by that destiny which regulates everything in the world of romance, he comes to Salerno. Here, if we recollect rightly, in a barber's shop, he hears all about the princess, and determines at once upon the course he is to pursue. He disguises himself as a physician, puts on a false beard, and proceeds to the palace to offer his services to the prince. By great good-fortune, he possessed one of the lady's gloves which had dropped from her hand when, in her father's garden, she mounted the horse with the magician. This token he carries with him in his bosom. On explaining his errand, he is admitted at once to see the patient, who acts the maniac with surpassing skill. Unobserved of the bystanders, he shews her the glove, upon which she examines his features and recognises him. The discovery, however, only renders her madness more complete; she laughs at him and his remedies, says she is not mad, and accuses all about her of insanity. Cleomades assures the Prince of Salerno that, having studied this particular disease all his life, he is certain he can perform a cure, and that, too, in a very short time. 'But what does she mean,' he said, 'by raving about a wooden horse?'

The prince answered that it was a toy that had been found with her in a field.

'Is it still preserved?' inquired Cleomades; 'because I think the sight of it would do her good.'

The prince, by way of reply, ordered it to be brought forth.

'Now, dear old doctor,' exclaimed the princess, 'do get on that horse, and take me behind you, and I shall be well immediately.'

Cleomades looked inquiringly at the prince.

'Humour her,' exclaimed the latter; 'it is the best way to effect a cure.'

'Well,' replied the physician, 'I obey your highness.'

So saying, he mounted the wooden horse; and the lady, with wonderful agility, vaulted up behind him, amidst peals of laughter from the courtiers. She grasped the physician, and with a wild laugh exclaimed: 'Dear doctor, let us take a ride.'

Looking at one another, the ladies and gentlemen whispered, that they might not wound the prince's ear: 'She is madder than ever!'

The prince himself began to despair, when suddenly the charger began to prance, and Cleomades, tearing off his beard, made a short speech, touched the magic spring, and away flew the horse to the palace of the prince's father in Spain.

Here ends the manuscript. The reader, we think, will agree with us that Chaucer most likely derived from this source a part of the *Squire's Tale*, but not the whole. All that relates to Canace and the falcon remains still unaccounted for; but in the prodigious mass of manuscripts existing in various libraries in

France, M. de Chatelain fully expects to find the original of the falcon also. It seems to be agreed on all hands that Chaucer would seldom be at the pains to invent; but when he found a plot ready to his hand, he invested it with so marvellous a wealth of poetry, that the original author would scarcely have recognised it.

In the present case, we think the public will receive with much pleasure the charming story of the King of the Minstrels, in M. de Chatelain's abridgment, which is full of grace, vivacity, and interest. What we have said of the sequel to Cambriscan Bold will, we trust, awaken some curiosity. We have ourselves read the manuscript with singular pleasure, and only regretted that it was not three times as long. We feel assured that the readers of Chaucer will all be of the same opinion.

A MERCHANT'S PALACE.

ONE among the many wonders of the times we live in is the marvellous rapidity with which immense edifices are constructed, seeming almost to realise the legends of old fairy-books concerning palaces and temples that sprang up spontaneously from the ground. Contrast in this respect the building of our old castles and cathedrals, laboriously extended over several generations—a turret having been built by this bishop, and the east window having been contributed by that—Sir Hugh having constructed the impregnable keep, and his grandson, the first baron, having completed the warder's tower—with that of our Crystal Palaces and Art Treasures Exhibitions, or the more durable fabric of our new Houses of Parliament. One of those 'forty and six year' which were required for the building of the Temple, would have sufficed modern architects to rear that noble pile. Whatever the mystic secret of the old free-masons might have been, it certainly did not include the rapidity of progress we have learned in these modern times, when free-masonry is only speculative, and when its members apply the square, the rule, and the compasses only to their lives and morals.

Two years ago, in the heart of the great city of Manchester, a body of workmen began to clear away a space for a new commercial building, of which the extent, and architectural beauty, and business facilities were to be unrivalled. More than fifty old houses were knocked down, several of them of a moral character that any great city could well dispense with; many fever dens and favourite musing spots of pestilence were rooted out, and the foundation of a great palace of industry was dug on the site. A forest of scaffolding speedily followed, bristling round the oblong enclosure, long fir-poles, crossed, and upright, and horizontal, lashed together with no end of cords. One could hardly see the building through the intervening array of boarding at the bottom, and boards and beams above, yet it progressed rapidly tier by tier—and the scaffolding with it—till in a few months the outside shell of a magnificent building was completed; and the planks and poles being taken away, the grandeur of its proportions and the beauty of its design could be duly perceived and appreciated. A detached mass of building stood boldly forth, 300 feet in length, 90 feet in width, and 100 feet in height, decorated with every device that architectural taste and skill could suggest, and forming the most extensive and commodious mercantile edifice in this great mercantile city. The outside show was now chiefly over; but for a year after, there were troops of workmen busy at their labour inside, doing both the useful and the ornamental in a large way. And just now, the interior arrangements having been finished, and the artificers having taken their departure, and goods by

thousands of cart-loads having come to stock the princely building, and swarms of clerks, warehousemen, salesmen, and packers having poured into their new hive, it has been opened for business purposes; and buying and selling, money-taking and money-making, have become the order of the day.

If contrast were required to set off the noble proportions and grandeur of this commercial temple, it might easily be found in the immediate neighbourhood. It is true, there are warehouses in front of it, large and commodious buildings; but behind it and on the flanks are still remaining nests of old tenements similar to those that were removed to make room for this gigantic building. Crowded courts and alleys, unprepossessing *culs de sac*, pigmy houses, one-sixth of the height of the towering edifice before them, packers' rooms, where the unemployed of that profession congregate, and while away their vacant hours with drink and cribbage; here you may see an intimation of a 'seller' being to let, warranted dry and airy; there a 'garratt' is open to an engagement—offering the houseless their choice of the two extremes in the scale of social life. Here live the people who make, or carry, or prepare for, the costly goods which lie in heaps in the palace opposite; they live, and sleep, and breathe in rooms where those goods would infallibly spoil. Such an atmosphere of dust and dirt would never do for money's worth—it matters not for human health and life. Yet to tell the truth, there are few living here, stifling themselves and their families in one or two small rooms, who could not afford to take a decent cottage of their own, if they were but thrifty and prudent. But this is not the place to moralise.

Let us first glance at the exterior. The front elevation is designed after the Italian style of architecture, following especially that modification of it which prevailed three centuries ago in the north of Europe. In adopting this style, however, considerable latitude has been observed; other things were necessary as well as beauty, and therefore the plan has been varied so as to suit the requirements of a building of this kind. Many things that an external observer might consider as mere architectural adjuncts, will be found on examination to answer important purposes in the arrangements and business of the establishment. The useful and the ornamental are here joined together in a way that would have astonished the architects of old. Perhaps you may remark the absence of those far-projecting buttresses you generally see in buildings of this style; ground is too valuable in the heart of this city to be wasted on projections and recesses, and so the front of the edifice is unrelieved by the light and shadow they produce; but to compensate in some measure for this, the windows of each story are different in design, and their bold and various outlines so diversify the lengthened front, that the sameness is quite destroyed. Four large pavilions mount upwards at equal distances along the front, which you would be almost sure to regard as intended chiefly for effect, and you would be surprised to learn that they fulfil one of the most important objects in the arrangements. In order to the preservation and proper examination of certain classes of goods, it is necessary that the bright rays of the sun should be kept from them; these towers, therefore, are so constructed that they supply light from the north side to one-half of the building, and thus meet that requirement. As far as possible, the same arrangement has been observed in the light borrowed from the roof, a large portion of which is of glass. York stone has been chiefly used for the front and sides, well rubbed and well laid—the same good stone from which so many noble churches, abbeys, and cathedrals were built in times of yore, and which still stand to attest the soundness of the

material. Of this, we are told, 73,000 cubic feet have been used in the construction; of timber, 40,000 cubic feet; of iron, 700 tons; of plate-glass, 27,000 square feet.

The principal entrance opens before us, with its splendid double-doorway, and a flight of massive stone-steps. We ascend into a vestibule, with ceiling groined and panelled, resting on columns of veined marble. The floor is formed of tessellated tiles, arranged in various patterns; the spandrels on either hand of the arcade are wrought in marble of different kinds. A prominent object on the pavement is a large box-scraper, guarded by two gilt-lions, couchant, and including fixed brushes for the further purification of the boots. By all means, let us make use of them; we are entering a temple that is sacred to the genius of commerce; let us leave the dirt of the common world outside. We are coming in contact, as Dr Johnson might have said, not with mere stuffs, silks, and cottons, but 'with the potentiality of growing rich beyond the dreams of avarice.' Are there any mammon-worshippers, we wonder, devout enough to slip off their Bluchers in the vestibule, and enter with bared feet upon this holy ground?

We enter through mahogany doors, heavy with plate-glass, and find ourselves in an immense room, there being no partitions to separate the various departments, so that each floor presents the appearance of a large hall. The very first thing that strikes us is the principal staircase, which starts immediately in front of the entrance, and branches off flight by flight till it reaches the top of the building. It is of pitch pine-wood, and noble in proportions, bounded by a hand-rail rich with elaborate tracery. Looking either up or down through the space left in the centre, the effect is very striking; a large circular roof-window throws ample light through that depth of a hundred feet. There is another staircase at the back for the use of manufacturers coming to transact business; it is of solid stone, and fire-proof, so that every floor might be commanded from it in case of accident from fire. The open space on the ground-floor is not so large as on those above, a portion being set apart for the offices, which extend along the inner side of the building. Here is a private room for the firm, comfortably fitted up like a substantial family dining-room; two private offices, and a long suite for twenty clerks. In the centre is the cashier's desk, elevated so as to command the range on either hand; on one side is the department for receiving money; on the other, that for payments. Tubular communication is carried on from hence over the greater part of the house—to the packers' quarter, the goods receiving division, and to every sale-department overhead. Lavatories, with marble fittings, are placed here for the use of the clerks; and in this respect, admirable provision has been made throughout the establishment. These offices present a beautiful appearance: to divide them from the trade-department, a screen of elaborate workmanship extends through their whole length, which is fitted with plate-glass, on which ornamental devices are posted. The pine-wood of which the screen is made being varnished, greatly resembles satin-wood, and the ornaments upon it (of iron) are picked out in green. The wood throughout has been chiefly treated in this way, and the effect is highly successful. Taste and skill have been taxed to the utmost in providing for every possible want, and introducing every possible beauty; the presses, the store-shelves, the counters, the columns, are all highly ornate; even the gas-jets take their rise from brass Corinthian columns, burning on the top of their capitals like fire upon an altar.

First, we wander about among piles of carpet, roll heaped up endwise upon roll, in columns of different

height; some drawn out to display their bright colour and fine texture; all sorts and conditions, from hemp to all-wool Kidderminster, from Dutch to velvet pile. Here is your modest library-carpet, small in device and of a mild hue—we prefer green by reason of our failing eyesight—there your royal fleur-de-lis pattern, sacred to church-communions; here again your richly wreathed and festooned drawing-room article, full of life and colour. One can't help thinking about the times when our sturdy ancestors strewed their rooms with rushes, and were as happy therewith and as brave as though they had trodden on the richest tapestry in Turkey. We pass by doormats, druggets, hearth-rugs, hassocks, and find ourselves amongst the linens, Scotch and Irish, done up in square packages, and piled in heaps. Here are about one hundred and twenty combinations of the same or similar materials, each having a separate name. Who would have thought that the genus linen had so many different species! Here we see the 'Royal Turkish,' and in close proximity the 'Russia Crash' (is it known by that name in the dominions of the Czar?) We are tempted to ask whether 'gray body lining' is not something good to eat? 'Brown ducks' we have seen in the course of our experience, but 'blue ducks'—who ever met with them? 'White unions' too must be connected in some way with wedding favours. Who was this 'Billy Foden' who has given his name to immortality in connection with 'satin stripes' and 'cross-overs'? The language of linen has its derivations and its doubtful points, and may yet puzzle the philologist. Sheetings bleached and unbleached, from Forfar, and Armagh, and elsewhere, lie packed in boards, and heaped up like walls, between which the visitor walks as in an alley. It would be idle to compute the square miles of ground which these myriads of yards would cover, or the beds they would furnish with decent pairs of sheets. Let us reserve our arithmetic and go up stairs.

We come here amongst the good broadcloths, types of old-fashioned English comfort and cordiality, furnished by western towns which have been celebrated for centuries for this class of manufacture, and furnished also by Yorkshire towns which rival them now in this branch. Connected with this department is a division for preparing patterns for the travelling-agents of the firm—a slip of every new cloth introduced is furnished to each traveller, and several persons are constantly employed in arranging and supplying these. From beavers and doeskins we go on merinos, stuffs, and alpacas, many of which are manufactured at Bradford, and others are of French make. They are brought in rough packages from the dyers, and are here folded on boards, and bound round with paper-bands, in readiness for drapers' stock. A machine is placed in one corner for doing this folding, the power for which is borrowed from a most useful little steam-engine in the basement, which performs many other good offices in the establishment. The folding-machine is fitted with an index which marks the measurement of every piece as it is thrown off. Cotton handkerchiefs of Scotch make lie here by thousands, striving, by dint of much colour, to attain a close resemblance to silk; quilts and counterpanes of divers texture and weight, to lie softly on you in the dog-days, or keep you snug at Christmas; table-covers also, to match any possible carpet, or any conceivable paper. Then we get amongst the muslins, about which, in truth, we are afraid of shewing our ignorance. We do not profess to be judges of a muslin dress in the piece at per yard; when it has been duly cut and braided, and whaleboned into shape, expanded into modern proportions, and fitted to the fair form of the wearer, then only can we say whether it is pretty or not, whether it suits Miss Blanche's complexion, or becomes the style of Miss Brunette's beauty. We

cannot be far out in the matter of these white muslins, however, for we incline to the opinion of a writer we have lately read, that 'white muslin is the most elegant and becoming of all dresses, and one that never looks poor.' Ah me, in how many drawing-rooms will these congregated muslins figure; at how many evening-parties will they rustle, and crush, and encounter untoward accidents; how often and with what metamorphoses and varieties of trimming will they be economically reproduced; over how many throbbing hearts will they spread their snowy beauty, and reveal no token of the love or grief or jealous pangs that may be at work beneath! We wonder whether the polite salesman ever thinks of these things, who now comes bustling up, fancying that he reads business in our meditative features. Manchester muslins, he calls them, and we like them none the less because they have been manufactured here; how light and clean to come forth from all our smoke and steam, and dust, and ashes! There are large heaps, however, from north of the Tweed which quite rival them in value and beauty. Here is spotless lawn, fine enough for the sleeves of an archbishop, and handkerchiefs per dozen, from dainty spider-web texture down to the coarsest cotton. Scores of other things there are too, the names and uses of which to us are deeply mysterious.

And now we are on the second floor, plunged into the midst of gloves. Boxes upon boxes, pile upon pile, white kids for weddings, and black kids for funerals; primrose for the secular dandy, and lavender for the clerical; homely worsted, such as warmed our school-boy fingers of yore; cotton; silk—every kind, and every kind in myriads. Here is something tasteful, something to suit the times—glove-boxes richly decorated, perfumed with some penetrating scent warranted permanent, and with portraits or landscapes painted on the lids in a really superior style of art. Their youthful royal highnesses stand first, of course. Windsor Castle, the palace of the Linden trees, a beaming picture of my Lord Palmerston, (slightly soiled), portraits of distinguished ladies—in short, a gallery of art, and all connected with gloves. The haberdashery department is chiefly represented by an infinitude of paper parcels, neatly folded, and labelled, and stocked. The inscriptions upon many of these would fail to give to the uninitiated the most remote idea of their contents. Who would suspect that the soldierly motto, *pro patria*, designated nothing better than a parcel of tapes, warranted full measure? Are the K.C.B.'s and C.B.'s aware that the heraldic legend of their most worshipful order, *tria juncta in uno*, has been appropriated by the threefold India cotton, 300 yards? We wander now amongst laces and sewing-silks, fringes and Berlin wools, whose beauties of colour are veiled, for they are rolled up in wrappers to keep them clean. This is the region of pins and needles, the habitants of which, however, do not look particularly uncomfortable; the pins are recommended as having 'superior solid heads'—an excellent quality in other articles than pins. We avert our looks modestly from the array of corsetage we now encounter, pass between hooks and eyes, through bobbins, braids, and buttons, and arrive at the quarter where umbrellas and parasols prevail, with travelling-bags of carpet and leather, purses, portemonnaies, and cloth-caps. Shirt fronts and collars also pass under review; among which shine conspicuous the 'Jullien Manifold' and the 'Boys' Eglintons, with ribbon-bow.' We say nothing of some hundred and fifty different kinds of stockings and 'sox' thickly imbedded in the presses; nor of the vests, pants, Guernseys, and other articles which must be nameless, all of which are multitudinously represented here. There is a bright department just before us, gaudy with many colours—a garden of artificial flowers. A

rich tree stands in the centre, blooming with a hundred different kinds of blossoms, where the black daisies for the mourning-cap are ranged along with orange-flowers and jessamine, and ripe grapes are drooping from the same branch which breaks out at the next joint into full-blown geraniums. Each is marvelously true to nature, and not more artificial than painting or sculpture, or any other device of man to imitate the appearance of life.

Up another flight of stairs, and we are among the prints, chiefly dresses, from the common blue which workhouse paupers wear, to an article fit for a duchess. We connect print-dresses with summer-time, and fine weather, charming watering-place rambles, and familiar morning-calls. We remember on awkwardly upsetting the cream-jug at breakfast in the lap of our maiden aunt (from whom we had expectations), what comfort we derived from the assurance that it was a washing-print she had on at the time. Also, on that decisive morning when we stammered forth the important question, and sealed our fate, was it not a print-dress (straw-coloured flowers on a white ground) in which the lovely form of the present Mrs Smith was arrayed? So these fancy patterns of blue stars and green rosebuds and garlands gay are pleasant to our sight. Here are silk pocket-handkerchiefs; and among the variety of patterns, our eyes light upon that of an old acquaintance, stolen from our pocket in Whitechapel years ago, and by us re-purchased a few days after from an elderly Hebrew gentleman on Saffron Hill. No unimportant proportion of capital is represented by these shawls, of which many rich and valuable specimens are hung up for show. Bethinking ourselves of certain conjugal hints connected with this subject, we inquire the price of one particular article, with a view of investing therein for the benefit of Mrs Smith; but our benevolent intentions are frustrated by the statement of the salesman, that 'the firm does no retail business.' Nothing peddling, or in a small way, but all in proportion with the colossal building and stock. A part of this division, containing the shawl and mantle department, is carpeted, so that the goods unfolded and held up for inspection may receive no damage from coming in contact with the floor. The counters on which they are shewn slope downwards from the windows, so as to place them in a slanting light, the better to exhibit the texture and colour. For the same purpose, the windows are fitted with Venetian blinds, the bottom part, for about two feet high, being fixed, and the upper part constructed so as to draw up, or turn to meet the light. For the protection of these valuable goods from dust, a sliding cover is fitted into each division of the press, which, when drawn out, falls upon hinges, and shuts up the compartment like a box.

One more ascent up the broad staircase, and we are at the summit of the general business premises, the pavilion story being reserved for miscellaneous stores. Here an opened door reveals a recess in which lies coiled a length of hose, which can be fixed to a tap close by in the wall, and thus an abundant supply of water may be conveyed in a few seconds to any part of the building. Here is the receiving-room, into which goods are hoisted from the wagons below—the ceiling under this room being of sheet-iron, as better adapted to bear the jar and pressure of heavy weights above. Part of this floor is also set apart for a manufacturer's room, and is approached by the separate staircase before alluded to. We pass through the blocking department, where the ribbons are wound round cylindrical blocks of wood; the imported articles are usually brought in ready-wound, but the blocks are removed at the custom-house, before weighing the ribbon; the blocking here is done by hand. Here are rolls upon rolls of saracen (sarac-

nette), the chief good which the Crusades conferred upon Western Europe; satins, silks, velvets, and muslins. Inconsiderable as the item of ribbons might seem among such a multitude of other articles, we are told that the transactions of the firm in this branch alone for the last week have reached tens of thousands of pounds. We observe in this quarter a few miles of that description of work which has occupied the attention of English womankind so much of late, termed embroidery, consisting (we speak reverently) in cutting out small holes with a charming pair of diminutive scissors, and industriously edging round the breach thus made. Further on are straw-hats and bonnets packed one in the other; laces, from Valenciennes and Brussels point, down to ordinary thread; hair-nets and fancy-caps; breakfast-caps to cover untrimmed hair; dress-caps to deck the matron for an evening-party; widows' caps, sombre and sad, and withal according to the latest fashion. Then, lastly, we get among the furs, cheap and costly, mock and natural; the royal and judicial ermine in unassuming contiguity with the common squirrel. With all his advancement, man has not yet quite forsaken his first clothing; silks and velvets have not altogether superseded the 'coats of skins.'

We have now seen all the show above-ground of this vast establishment. Overhead, in the pavilions, there is as yet nothing but the *débris* of broken boxes and spare wrappers. From the windows, however, one commands a view of the city, varying in extent and clearness according to the condition of the smoke. Early in the morning, we are told, the prospect of such a forest of chimneys, wide-spreading roofs, church-towers and steeples, is something imposing. At present, it is all thrown very deeply into shade; we therefore prepare to close our inspection by a visit to the basement. We descend—not in the ordinary way of down-stair travelling, but by means of a hoist, used for raising and sending down goods. Of these, there are two in the establishment, worked by steam. In two or three seconds, we are dropped in the immediate vicinity of the useful engine which works the hoists, turns the winding-machines, pumps water for the hydraulic-presses, moves the cranes, and discharges other important duties. On the basement-floor we find, first, an entering-room, through which all parcels have to pass before they leave the establishment, the contents being duly booked, and the account checked of the department from which they have come. Next, a saleroom for heavy linens and flannels, the bulk of which excludes them from the rooms up stairs; and near this, we observe a vault sunk in the wall, iron-lined and fire-proof, for the protection of the books of the firm. Here is also a division for the manufacture and repair of packing-cases and boxes for general use. Finally, we reach the packing-room, in which the goods sold are done into shape, rolled, put up in boxes or in paper as the case may be, and duly directed before they leave the premises. Two large hydraulic-presses are placed here to assist in this process, and the way in which they reduce a mountain of miscellaneous goods to a very mole-hill of a package is a marvellous thing to witness.

Our obliging conductor now leads the way up stairs, and informs us that we have inspected all the chief wonders of the establishment. Other wonders there are, no doubt, not quite so patent as these. We should like to hear some illustrations of profitable speculation, some examples of market-risks and fluctuations; we should like to have some idea as to the capital employed, the value of the credit given, the amount of profit realised; we are puzzled to think how the firm can make up their income-tax returns, having experienced some difficulty in that matter even in our small way. But these are trade secrets, and it

would be impertinent to inquire into them. One thing our visit has taught us—how beauty may be united to usefulness with mutual advantage, and at no great additional cost. What might have been a huge draper's shop, is here converted into a very temple, and the stock itself becomes a decoration. So we see how trade may be made graceful, and commerce turned into a fine art; how there may be poetry in L. s. d.; and tender strokes touch the soul even while the question is concerning linsey-woolsey or mousseline-de-laine. We feel as if we had done much more than inspect mere warehouse-stock, as we pass forth from the merchant's palace.

OCEOLA:

A ROMANCE.

CHAPTER LIV.—A VICTORY ENDING IN A RETREAT.

I saw not the speaker, who was completely hidden behind the thick trellis of leaves. It was not necessary I should see him, to know who addressed me; on hearing the voice I instantly recognised it. It was Oqeola who spoke.

I cannot describe my sensations at that moment, nor tell exactly how I acted. My mind was in a chaos of confusion—surprise and fear mingling alike in my emotions.

I remember facing once more towards my followers. I saw that they were not all dead—some were still lying where they had fallen, doubled up, or stretched out in various attitudes of death—motionless—beyond doubt, lifeless. Some still moved, their cries for help showing that life was not extinct.

To my joy, I observed several who had regained their feet, and were running, or rather scrambling, rapidly away from the ground; and still another few who had risen into half-erect attitudes, and were crawling off upon their hands and knees.

These last were still being fired upon from the bushes; and as I stood wavering, I saw one or two of them levelled along the grass by the fatal bullets that rained thickly around me.

Among the wounded who lay at my feet, there was a young fellow whom I knew. He appeared to be shot through both limbs, and could not move his body from the spot. His appeal to me for help was the first thing that aroused me from my indecision: I remembered that this young man had once done me a service.

Almost mechanically, I bent down, grasped him around the waist, and, raising his body, commenced dragging him away.

With my burden I hurried back across the sathmus—as fast as my strength would permit—nor did I stop till beyond the range of the Indian rifles. Here I was met by a party of soldiers, sent to cover our retreat. In their hands I left my disabled comrade, and hastened onward to deliver my melancholy report to the commander-in-chief.

My tale needed no telling. Our movement had been watched, and our discomfiture was already known throughout the whole army.

The general said not a word; and, without giving time for explanation, ordered me to another part of the field.

All blamed his imprudence in having ordered such a desperate charge—especially with so small a force. For myself, I had gained the credit of a bold leader; but how I chanced to be the only one, who came back unscathed out of that deadly fire, was a puzzle which at that moment I did not choose to explain.

For an hour or more the fight continued to be carried on, in the shape of a confused skirmish among swamps and trees, without either party gaining any material advantage. Each held the position

it had taken up—though the Indians retained the freedom of the forest beyond. To have retired from ours, would have been the ruin of the whole army; since there was no other mode of retreat, but by recrossing the stream, and that could only have been effected under the fire of the enemy.

And yet to hold our position appeared equally ruinous. We could effect nothing by being thus brought to a stand-still, for we were actually besieged upon the bank of the river. We had vainly endeavoured to force the Indians from the bush. Having once failed, a second attempt to cut our way through them would be a still more perilous enterprise; and yet to remain stationary had also its prospects of danger. With scanty provisions, the troops had marched out of their cantonments. Their rations were already exhausted—hunger stared the army in the face. Its pangs were already felt, and every hour would render them more severe.

We began to believe that we were besieged; and such was virtually the fact. Around us in a semi-circle swarmed the savages, each behind his protecting tree—thus forming a defensive line equal in strength to a fortified intrenchment. Such could not be forced, without the certainty of great slaughter among our men.

We perceived, too, that the number of our enemies was hourly increasing. A peculiar cry—which some of the old 'Indian fighters' understood—heard at intervals, betokened the arrival of fresh parties of the foe. We felt the apprehension that we were being outnumbered, and night soon be overpowered. A gloomy feeling was fast spreading itself through the ranks.

During the skirmishes that had already occurred, we noticed that many of the Indians were armed with fusils and muskets. A few were observed in uniform, with military accoutrements! One—a conspicuous leader—was still more singularly attired. From his shoulders was suspended a large silken flag, after the fashion of a Spanish cloak of the times of the conquistadores. Its stripes of alternate red and white, with the blue starry field at the corner, were conspicuous. Every eye in the army looked upon it, and recognised in the fantastic draping, thus tauntingly displayed, the loved flag of our country.

These symbols were expressive. They did not puzzle us. Their presence among our enemies was easily explained. The flag, the muskets and fusils, the uniforms and equipments, were trophies from the battle-field where Dade had fallen.

Though the troops regarded these objects with bitter indignation, their anger was impotent: the hour for avenging the disastrous fate of their comrades had not yet arrived.

It is not improbable we might have shared their destiny, had we remained much longer upon the ground; but a plan of retreat offered, of which our general was not loath to take advantage. It was the happy idea of a volunteer officer—an old campaigner of the 'Hickory' wars—versed in the tactics of Indian fighting.

By his advice, a felot was made by the troops who had not yet crossed—the volunteers. It was a pretended attempt to effect the passage of the river at a point higher up-stream. It was good strategy. Had such a passage been possible, it would have brought the enemy between two fires, and thus put an end to the 'surround'; but a crossing was not intended—only a ruse.

It had the effect designed; the Indians were deceived by it, and rushed in a body up the bank to prevent the attempt at crossing. Our beleaguered force took advantage of their temporary absence; and the 'regulars,' making an adroit use of the time—succeeded in getting back to the 'safe side' of

river. The wily foe was too prudent to follow us; and thus ended the 'battle of the Outhlacoochee.'

In the hurried council that was held, there were no two opinions as to what course of action we should pursue. The proposal to march back to Fort King was received with a wonderful unanimity; and, with little loss of time, we took the route, and arrived without further molestation at the fort.

CHAPTER LXIX.

ANOTHER 'SWAMP-FIGHT.'

After this action, a complete change was observed in the spirit of the army. Boasting was heard no more; and the eagerness of the troops to be led against the enemy was no longer difficult to restrain. No one expressed desire for a second expedition across the Outhlacoochee, and the 'Cove' was to remain unexplored until the arrival of reinforcements. The volunteers were disheartened, wearied of the campaign, and not a little cowed by the resistance they had so unexpectedly encountered—bold and bloody as it was unlooked for. The enemy, hitherto despised, if it had aroused by its conduct a strong feeling of exasperation and vengeance, had also purchased the privilege of respect.

The battle of the Outhlacoochee cost the United States army nearly a hundred men. The Seminole loss was believed to be much greater; though no one could give a better authority for this belief than that of a 'guess.' No one had seen the enemy slain; but this was accounted for by the assertion, that during the fight they had carried their dead and wounded from the field!

How often has this absurd allegation appeared in the dispatches of generals both victorious and defeated! It is the usual explanation of a battlefield found too sparsely strewn by the bodies of the foe. The very possibility of such an operation argues either an easy conflict, or a strong attachment between comrade and comrade—too strong, indeed, for human nature. With some fighting experience, I can affirm that I never saw a dead body, either of comrade or foe, moved from the ground where he had fallen, so long as there was a shot ringing upon the ear.

In the battle of the Outhlacoochee, no doubt some of our enemies had 'bit the dust;' but their loss was much less than that of our own troops. For myself—and I had ample opportunity for observation—I could not swear to a single 'dead Indian;' nor have I met with a comrade who could.

Notwithstanding this, historians have chronicled the affair as a grand 'victory,' and the dispatch of the commander-in-chief is still extant—a curious specimen of warlike literature. In this document may be found the name of almost every officer engaged, each depicted as a peerless hero! A rare monument of vanity and boasting.

To speak the honest truth, we had been well 'whipped' by the red skins; and the chagrin of the army was only equalled by its exasperation.

Clinch, although esteemed a kind general—the 'soldier's friend,' as historians term him—was no longer regarded as a great warrior. His glory had departed. If Ogeola owed him any spite, he had reason to be satisfied with what he had accomplished, without molesting the 'old veteran' further. Though still living, he was dead to fame. * * *

A fresh commander-in-chief now made his appearance, and hopes of victory were again revived. The new general was Gaines, another of the 'veterans' produced by seniority of rank. He had not been ordered by the government upon this especial duty; but Florida being part of his military district, had volunteered to take the guidance of the war.

Like his predecessor, Gaines expected to reap a rich harvest of laurels, and, like the former, was he doomed to disappointment. Again, it was the cypress-wreath.

Without delay, our army—reinforced by fresh troops from Louisiana and elsewhere—was put in motion, and once more marched upon the 'Cove.'

We reached the banks of the Amazura, but never crossed that fatal stream—equally fatal to our glory as our lives. This time, *the Indians crossed.*

Almost upon the ground of the former action—with the difference that it was now upon the nether bank of the stream—we were attacked by the red warriors; and, after some hours of sharp skirmishing, compelled to shelter our proud battalions within the protecting pickets of a stockade! Within this enclosure we were besieged for a period of nine days, scarcely daring to trust ourselves outside the wooden walls. Starvation no longer stared us in the face—it had actually come upon us; and but for the horses we had hitherto bestrode—with whose flesh we were fain to satisfy the cravings of our appetites—one-half the army of 'Camp Izard' would have perished of hunger.

We were saved from destruction by the timely arrival of a large force that had been despatched to our rescue under Clinch, still commanding his brigade. Having marched direct from Fort King, our former general had the good-fortune to approach the enemy from their rear, and, by surprising our besiegers, disentangle us from our perilous situation.

The day of our delivery was memorable by a singular incident—an armistice of a peculiar character.

Early in the morning, while it was yet dark, a voice was heard hailing us from a distance, in a loud 'Ho there!—Halloa!'

It came from the direction of the enemy—since we were surrounded, it could not otherwise—but the peculiar phraseology led to the hope that Clinch's brigade had arrived.

The hail was repeated, and answered; but the hope of a rescue vanished when the stentorian voice was recognised as that of Abram, the black chief, and quondam interpreter of the council.

'What do you want?' was the interrogatory ordered by the commander-in-chief.

'A talk,' came the curt reply.

'For what purpose?'

'We want to stop fighting.'

The proposal was agreeable as unexpected. What could it mean? Were the Indians starving, like ourselves, and tired of hostilities? It was probable enough: for what other reason should they desire to end the war so abruptly? They had not yet been defeated, but, on the contrary, victorious in every action that had been fought.

But one other motive could be thought of. We were every hour expecting the arrival of Clinch's brigade. Runners had reached the camp to say that he was near, and, reinforced by it, we should be not only strong enough to raise the siege, but to attack the Indians with almost a certainty of defeating them. Perhaps they knew, as well as we, that Clinch was advancing, and were desirous of making terms before his arrival.

The proposal for a 'talk' was thus accounted for by the commander-in-chief, who was now in hopes of being able to strike a decisive blow. His only apprehension was, that the enemy should retreat, before Clinch could get forward upon the field. An armistice would serve to delay the Indians upon the ground; and, without hesitation, the distant speaker was informed that the talk would be welcome.

A meeting of *parlementaires* from each side was arranged; the hour, as soon as it should be light. There were to be three of the Indians, and three from the camp.

A small savanna extended from the stockade. At several hundred yards' distance it was bounded by the woods. As soon as the day broke, we saw three men emerge from the timber, and advance into the open ground. They were Indian chiefs in full costume; they were the commissioners. All three were recognised from the camp—Abram, Coa Hajo, and Oqeola.

Outside musket-range, they halted, placing themselves side by side in erect attitudes, and facing the enclosure.

Three officers, two of whom could speak the native tongue, were sent forth to meet them. I was one of the deputation.

In a few seconds we stood face to face with the hostile chiefs.

CHAPTER LXX.

THE TALK.

Before a word was uttered, all six of us shook hands—so far as appearances went, in the most friendly manner. Oqeola grasped mine warmly; as he did so, saying, with a peculiar smile:

'Ah, Randolph! friends sometimes meet in war as well as in peace.'

I knew to what he referred, but could only answer him with a significant look of gratitude.

An orderly, sent to us with a message from the general, was seen approaching from the camp. At the same instant, an Indian appeared coming out of the timber, and, keeping pace with the orderly, simultaneously with the latter arrived upon the ground. The deputation was determined we should not outnumber it.

As soon as the orderly had whispered his message, the 'talk' began.

Abram was the spokesman on the part of the Indians, and delivered himself in his broken English. The others merely signified their assent by a simple nod, or the affirmative 'Ho'; while their negative was expressed by the exclamation 'Cooree.'

'Do you white folk want make peace?' abruptly demanded the negro.

'Upon what terms?' asked the head of our party.

'Da tarme we gib you are dese: you lay down arm, an' stop de war; your sogas go back, an' stay in dar forts: we *Indyen* cross ober da Ouitlacochee; an' from dis time forth, for ebbor affer, we make de grand ribber da line o' boundary atween de two. We promise lib in peace an' good tarme wi' all white neighbor. Dat's all got say.'

'Brothers!' said our speaker in reply, 'I fear these conditions will not be accepted by the white general, nor our great father, the President. I am commissioned to say, that the commander-in-chief can treat with you on no other conditions than those of your absolute submission, and under promise that you will now agree to the removal.'

'*Coorees! coorees!* never!' haughtily exclaimed Coa Hajo and Oqeola in one breath, and with a determined emphasis, that proved they had no intention of offering to surrender.

'An' what for we submit?' asked the black, with some show of astonishment. 'We not conquered! We conquer you ebbory fight—we whip you people, one, two, tree time—we whip you; dam! we kill you well too. What for we submit? We come here gib condition—not ask um.'

'It matters little what has hitherto transpired,' observed the officer in reply; 'we are by far stronger than you—we must conquer you in the end.'

Again the two chiefs simultaneously cried 'Cooree!'

'May be, white men, you make big mistake 'bout our strength. We not so weak you tink for—dam! no. We shew you our strength.'

As the negro said this, he turned inquiringly

towards his comrades, as if to seek their assent to some proposition.

Both seemed to grant it with a ready nod; and Oqeola, who now assumed the leadership of the affair, faced towards the forest, at the same time giving utterance to a loud and peculiar intonation.

The echoes of his voice had not ceased to vibrate upon the air, when the evergreen grove was observed to be in motion along its whole edge; and the next instant, a line of dusky warriors shewed itself in the open ground. They stepped forth a pace or two, then halted in perfect order of battle—so that their numbers could easily be told off from where we stood.

'Count the red warriors!' cried Oqeola, in a triumphant tone—'count them, and be no longer ignorant of the strength of your enemy.'

As the Indian uttered these words, a satirical smile played upon his lips; and he stood for some seconds confronting us in silence.

'Now,' continued he, once more pointing to his followers, 'do yonder braves—there are fifteen hundred of them—do they look starving and submissive? No! they are ready to continue the war till the blood of the last man sinks into the soil of his native land. If they must perish, it will be here—here in Florida—in the land of their birth, upon the graves of their fathers.'

'We have taken up the rifle because you wronged us, and would drive us out. For the wrongs we have had revenge. We have killed many of your people, and we are satisfied with the vengeance we have taken. We want to kill no more. But about the removal, we have not changed our minds. We shall never change them.'

'We have made you a fair proposition: accept it, and in this hour the war may cease; reject it, and more blood shall be spilled—ay, by the spirit of Wykomé! rivers of blood shall flow. The red poles of our lodges shall be painted again and again with the blood of our pale-faced foes. Peace or war then—you are welcome to your choice.'

As Oqeola ceased speaking, he waved his hand towards his dusky warriors by the wood, who at the sign disappeared among the trees silently, rapidly, almost mysteriously.

A meet reply was being delivered to the passionate harangue of the young chief, when the speaker was interrupted by the report of musketry, heard in the direction of the Indians, but further off. The shots followed each other in rapid succession, and were accompanied by shouts, that, though feebly borne from the far distance, could be distinguished as the charging cheers of men advancing into a battle.

'Ha! foul play!' cried the chiefs in a breath; 'pale-faced liars! you shall rue this treason;' and, without waiting to exchange another sentence, all three sprang off from the spot, and ran at full speed towards the covert of the woods.

We turned back within the lines of the camp, where the shots had also been heard, and interpreted as the advance of Clinch's brigade attacking the Indian outposts in the rear. We found the troops already mustered in battle-array, and preparing to issue forth from the stockade. In a few minutes, the order was given, and the army marched forth, extending itself rapidly both right and left along the bank of the river.

As soon as the formation was complete, the line advanced. The troops were burning for revenge. Cooped up as they had been for days, half-famished, and more than half-disgraced, they had now an opportunity to retrieve their honour; and were fully bent upon the punishment of the savage foe. With an army in their rear, rapidly closing upon them by an extended line—for this had been pre-arranged between the commanders—another similarly advancing upon

their front, how could the Indians escape? They must fight—they would be conquered at last.

This was the expectation of all—officers and soldiers. The commander-in-chief was himself in high spirits. His strategic plan had succeeded. The enemy was surrounded—entrapped; a great victory was before him—a 'harvest of laurels.'

We marched forward. We heard shots, but now only solitary or straggling. We could not hear the well-known war-cry of the Indians.

We continued to advance. The hommocks were carried by a charge, but in their shady coverts we found no enemy.

Surely they must still be before us—between our lines and those of the approaching reinforcement? Is it possible they can have retreated—escaped?

No! Yonder they are—on the other side of the meadow—just coming out from the trees. They are advancing to give us battle! Now for the charge—now—

Ha! those blue uniforms and white belts—those forage-caps and sabres—these are not Indians! It is not the enemy! They are our friends—the soldiers of Clinch's brigade!

Fortunate it was that at that moment there was a mutual recognition, else might we have annihilated one another.

CHAPTER LXXI.

MYSTERIOUS DISAPPEARANCE OF AN ARMY.

The two divisions of the army now came together, and after a rapid council had been held between the commanders, continued scouring the field in search of our enemy. Hours were spent in the search; but not an Indian foe could be found!

Oceola had performed a piece of strategy unheard of in the annals of war. He had carried an army of 1500 men from between two others of nearly equal numbers, who had completely enfolded him, without leaving a man upon the ground—ay, without leaving a trace of his retreat. That host of Indian warriors, so lately observed in full battle-array, had all at once broken up into a thousand fragments, and, as if by magic, had melted out of sight.

The enemy was gone, we knew not whither; and the disappointed generals once more marched their forces back to Fort King.

The 'dispersion,' as it was termed, of the Indian army, was of course chronicled as another 'victory.' It was a victory, however, that killed poor old Gaines—at least his military fame—and he was only too glad to retire from the command he had been so eager to obtain.

A third general now took the field as commander-in-chief—an officer of more notoriety than either of his predecessors—Scott. A lucky wound received in the old British wars, seniority of rank, a good deal of political buffoonery, but above all a free translation of the French 'system of tactics,' with the assumption of being their author, had kept General Scott conspicuously before the American public for a period of twenty years.* He who could contrive such a system of military manœuvring, could not be otherwise than a great soldier; so reasoned his countrymen.

* Scott's whole career, political as well as military, has been a series of *faux pas*. His campaign in Mexico will not bear criticism. The numerous blunders he there committed would have led to most fatal results, had they not been neutralised by the judgment of his inferior officers, and the indomitable valour of the soldiery. The battle of Molino del Rey—the armistice with Santa Anna, were military errors unworthy of a cadet fresh from college. I make bold to affirm that every action was a mob-fight—the result depending upon mere chance; or rather on the desperate bravery of the troops upon one side, and the infamous cowardice of those on the other.

Of course wonderful things were expected from the new commander-in-chief, and great deeds were promised. He would deal with the savages in a different way from that adopted by his predecessors; he would soon put an end to the contemptible war.

There was much rejoicing at the appointment; and preparations were made for a campaign on a far more extensive scale than had fallen to the lot of either of the chiefs who preceded him. The army was doubled—almost trebled—the commissariat amply provided for, before the great general would consent to set foot upon the field.

He arrived at length, and the army was put in motion.

I am not going to detail the incidents of this campaign; there were none of sufficient importance to be chronicled, much less of sufficient interest to be narrated. It consisted simply of a series of harassing marches, conducted with all the pomp and regularity of a parade review. The army was formed into three divisions, somewhat bombastically styled 'right wing,' 'left wing,' and 'centre.' Thus formed, they were to approach the 'Cove of the Ouithlacoochee'—again that fatal Cove—from three different directions, Fort King, Fort Brooke, and the St Johns. On arriving on the edge of the great swamp, each was to fire minute-guns as signals for the others, and then all three were to advance in converging lines towards the heart of the Seminole fastness.

The absurd manœuvre was carried out, and ended, as might have been expected, in complete failure. During the march, no man saw the face of a red Indian. A few of their camps were discovered, but nothing more. The cunning warriors had heard the signal guns, and well understood their significance. With such a hint of the position of their enemy, they had but little difficulty in making their retreat between the 'wings.'

Perhaps the most singular, if not the most important, incident occurring in Scott's campaign was one which came very near costing me my life. If not worthy of being given in detail, it merits mention as a curious case of 'abandonment.'

While marching for the 'Cove' with his centre wing, the idea occurred to our great commander to leave behind him, upon the banks of the Amazura, what he termed a 'post of observation.' This consisted of a detachment of forty men—mostly our Suwanee volunteers, with their proportion of officers, myself among the number.

We were ordered to fortify ourselves on the spot, and stay there until we should be relieved from our duty, which was somewhat indefinitely understood even by him who was placed in command of us. After giving these orders, the general, at the head of his 'central wing,' marched off, leaving us to our fate.

Our little band was sensibly alive to the perilous position in which we were thus placed; and we at once set about making the best of it. We felled trees—built a block-house, dug a well, and surrounded both with a strong stockade.

Fortunately we were not discovered by the enemy for nearly a week after the departure of the army, else we should most certainly have been destroyed to a man. The Indians, in all probability, had followed the 'centre wing,' and thus for the time were carried out of our neighbourhood.

On the sixth day, however, they made their appearance, and summoned us to surrender.

We refused, and fought them—again and again, at intervals, during a period of fifty days!

Several of our men were killed or wounded; and among the former, the gallant chief of our devoted band, Holloman, who fell from a shot fired through the interstices of the stockade.

Provisions had been left with us to serve us for two

weeks; they were eked out to last for seven! For thirty days we subsisted upon raw corn and water, with a few handfuls of acorns, which we contrived to gather from the trees growing within the enclosure.

In this way we held out for a period of fifty days, and still no commander-in-chief—no army came to relieve us. During all that gloomy siege, we never heard word of either; no white face ever shewed itself to our anxious eyes, that gazed constantly outward. We believed ourselves abandoned—forgotten.

And such in reality was the fact—General Scott, in his eagerness to get away from Florida, had quite forgotten to relieve the 'post of observation;' and others, believing that we had long since perished, made no effort to send a rescue.

Death from hunger stared us in the face, until at length the brave old hunter, Hickman, found his way through the lines of our besiegers, and communicated our situation to our 'friends at home.'

His tale produced a strong excitement, and a force was despatched to our relief, that succeeded in dispersing our enemies, and setting us free from our block-house prison.

Thus terminated 'Scott's campaign,' and with it his command in Florida. The whole affair was a burlesque, and Scott was only saved from ridicule, and the disgrace of a speedy recall, by a lucky accident that fell in his favour. Orders had already reached him to take control of another 'Indian war'—the 'Creek'—that was just breaking out in the states of the south-west; and this afforded the discomfited general a well-timed excuse for retiring from the 'Flowery Land.'

Florida was destined to prove to American generals a land of melancholy remembrances. No less than seven of them were successively beaten at the game of Indian warfare by the Seminoles and their wily chieftains. It is not my purpose to detail the history of their failures and mishaps. From the disappearance of General Scott, I was myself no longer with the main army. My destiny conducted me through the more romantic by-ways of the campaign—the paths of *la petite guerre*—and of these only am I enabled to write. Adieu, then, to the grand historic.

DIPSOMANIACS.

A SHORT time ago, we drew attention to a pamphlet of Dr Peddie on the subject of dipsomania—a craving for intoxicating liquors that partakes of the nature of madness, and which now seems to call for some special legislation. Since making these remarks, a lecture on the same subject has been delivered at the Royal College of Surgeons in Edinburgh, by Professor Christison, who adopts views of dipsomania similar to those of Dr Peddie. Referring to the peculiar style of treatment required for dipsomaniacs, the learned professor made some observations which are worthy of extended publicity.

He mentioned, that 'in Scotland, medical men had already established a system of treatment which was applied to all those who would consent to submit to it; and it was found to answer the purpose very well; so that all that was required of the legislature was to render compulsory, at the instance of the nearest relative of the patient, what was at present merely voluntary. He then described an institution at Strathaird, in the Isle of Skye, for patients of this kind, where inmates had unrestrained liberty, ample opportunities for amusing and interesting pursuits, no possibility of getting any drink but whisky, and no chance of getting that except by walking twelve miles to one place, where they had to deceive the dealer, who was bound not to sell to any of the anchorites of Strathaird, or by walking fourteen miles to another place, where the dealer was free from any restriction. He had visited that establishment himself, and found the patients living in a state of sobriety,

apparent happiness, and real freedom. He was very much mistaken if any further legislation was necessary than to legalise such seclusion.'

The lecturer concluded by suggesting for this purpose, a modification of the system pursued in regard to lunatic asylums. Retreats for dipsomaniacs, licensed by the sheriff as being properly situated, and under proper management, might receive patients, whose need for the retirement was certified by the same authority, dismissal to be only obtained through the sheriff, or a certificate of cure from the proprietor of the establishment, and the relatives. 'When a patient was sent to such a sanatorium, it should not be necessary that he should be deprived of all control over his affairs, but that he should be allowed to manage them under the guidance of the sheriff; if the patient were unfit for that, then the nearest relative should have power to sue for a curator. As the friends of the inmates were to pay for their maintenance, it would be quite unnecessary to provide for the erection of asylums of the kind required, as the supply would be sure to follow the demand. The case of pauper lunatics of this order could not, of course, be thought of at that moment, but must be delayed till the experiment had been tried on the other classes.'

Professor Christison's lecture was well received by a numerous and respectable auditory, and we cannot but consider that the difficult and delicate subject on which he treated has already made a distinct advance towards legislative action.

EVENING IN EARLY SPRING.

THE west is crimsoned, and the evening falls,
The lamp of night is lighting up aloft;
Unto his mate afar the partridge calls,
The blue wren's tinkle ceases in the croft.

Upon the waving poplar's topmost spray,
His mellow note the thrush is piping forth,
Singing his farewell to the dying day,
While pale stars peep out in the dusky north.

Over the land the sunny south wind blows,
The spring's first wrestle with the winter's cold;
And nature flushed, with genial triumph glows,
On sparkling fount, and cloudbet tipped with gold.

The morn was balmy, and the noontide bright,
And happy children strayed to gather flowers;
Seeking the slopes with celandines adight,
Whereon in March winds, daisies make their bowers.

The father led his children forth to-day,
To scented violets, clustered white and blue,
To watch the young lambs bounding in their play,
Perchance to hear the merry sweet cuckoo.

The twilight closes o'er the balmy eve,
The bat is flitting in the quiet air,
The wren, his last song on the fence doth weave,
And the shy rabbit leaves his sandy lair.

Blithe lovers wander happy, arm in arm,
Moved by the magic of the witching time,
Thus tasting, ere life's toils begin, a balm,
To memory precious in their after prime.

The field, and grove, and music of the bird,
The humming insect, and the budding bough,
Wilding and tame, the sounds in still night heard,
And the shrill whistle of the wild wind's sigh;

All sing God's praise; thus musing home we go,
Grateful for nature, pleased that as we plod,
While native music falls from these, we know,
We too may raise a grateful song to God.

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 229.

SATURDAY, MAY 22, 1858.

PRICE 1½d.

THE GENERAL'S NEPHEW.

SEVERAL years before the introduction of Minié-rifles and tunics, when Brown Bess with a well-hammered flint was considered the most efficient weapon of the British soldier, the regiment to which I then belonged was stationed, during its Indian tour of service, in the Sultryport division, commanded by Major-general Sir Hannibal Peacocke, K.C.B., one of the best whist-players and worst general officers in the service. He had entered the army young, and having both luck and interest, rose rapidly to the rank of lieutenant-colonel, when he was put on half-pay, and, having served almost exclusively on the staff, as ignorant of regimental duty as a man well could be. During the years which followed, he endeavoured, by assiduous attention to the duties of a man about town, to fit himself for future command; and on promotion to the rank of general, attended every levee of the commander-in-chief, asking for employment, and became a regular hanger-on at the Horse-guards, who, either to get rid of his importunities, or oblige his brother-in-law, Lord Cawood, gave him a division in India. Favoured child of fortune as he was, the general was always grumbling at his ill-luck, particularly at the card-table, though he could not bear to hear any one else do so, and would always demolish the complainant's grievance by quoting some greater misfortune which had happened to himself, making the lesser mischance appear contemptible and insignificant. If a defeated adversary made any remark on the number of rubbers he had lost, the general would exclaim: 'You don't call that a run of ill-luck, do you, sir? Why, I played whist regularly every night for eight years, and never held a trump the whole time.'

'But, Sir Hannibal,' rashly suggests an incredulous sub, 'you must have dealt every fourth round, and taken the turn-up card into your hand.'

'By no means, sir; with my usual luck, I positively made a misdeal every time.'

The youngster is silenced; and the triumphant general makes a mental *mem.* that so wide-a-woke a young gentleman is just suited for the agreeable task of the next treasure-escort, which amiable intention he generally carried out with praiseworthy fidelity.

The general had never been married; but he brought out a nephew with him, who he requested might be gazetted to the first vacancy occurring in any of Her Majesty's regiments in the Sultryport division. In those days, commissions had not been thrown open to public competition; preparatory examination was undreamed of, and popular opinion

unanimously pointed out the greatest fool of the family as the fittest for the army.

No rational doubt could be entertained that Lord Cawood's second son was perfectly eligible on this score to wear a red coat: he accompanied his uncle to India; and soon after their arrival, the *Gazette* informed us that the Honourable Peregrine Falcon Rooke had purchased an ensigncy in our regiment.

There was at the time, I fear, a sadly democratic feeling in the corps, as some of our slips of aristocracy had not been very favourable specimens; and others who had left the regiment soon after going on foreign service, had made rather hard bargains with their successors. We were not, therefore, inclined to think better of the young hand because he happened to be an earl's son; besides which, we were shortly afterwards ordered in from our out-station, where game was abundant and duty light, to the formality and field-days of division head-quarters; and we all felt sure that our recall from our happy hunting-grounds was chiefly in order that the junior ensign should be under the avuncular eye, and have the benefit of his countenance and support on first joining.

We arrived in Sultryport at the beginning of the hot season, and being a new station, houses were so scarce there that five of us were fain to content ourselves with the joint-occupancy of a splendid mansion, consisting of one large room, with an enclosed verandah all round. That is to say, we remained in the house by day, and slept at night in tents pitched close outside, until, as the rainy season drew near, we were driven from their comparative coolness by sand-storms occurring nearly every night, which forced us to take refuge in the house.

It was an unusually hot season even for that climate; the rains delayed their coming; the hot wind blew from sunrise till midnight; there was a lurid haze in the scorching atmosphere, through which objects loomed large as if seen through a fog. Our only chance of getting any sleep was to keep the punkah going all night, for which purpose we had a relay of coolies; much-enduring individuals, without any peculiar characteristics mental or physical, except an inordinate capacity for sleep and extreme scantiness of drapery, who, in consideration of the monthly guerdon of eight shillings, without board or lodging, undertook that one of their number should always be ready to fan our fevered brows. Like most natives, they possessed the power of instantly composing themselves to sleep at any hour of the four and twenty; but at night, in particular, the exercise of their monotonous vocation seemed to possess an effect as irresistibly somniferous as the branch dripping

with Lethan dew did on Palinurus. Somnus relaxed their wearied limbs; the long punkah, under which all slept, stopped, and we awoke, bathed in perspiration, to abuse the coolie, rub our mosquito bites, and doze off again. The paymaster, a choleric little Welshman, being the most wakeful of the party, took upon himself the task of keeping the coolies on the alert, for which purpose his cot was placed in the centre, with an abundant supply of ammunition heaped alongside thereof, in the shape of the united boots and shoes of the entire party, besides a collection of sundry miscellaneous articles, such as glove-trees, cricket-balls, old books, &c., which might, on occasion, be converted into projectiles. Even with this formidable armament, and the fear of punishment before their eyes, the coolies did snooze occasionally; but retribution swift and terrible followed, from the avenging slipper of the paymaster.

I do not think we were as grateful to him as we ought to have been for his exertions, as we found that the noise produced by the shower of missiles, the crash of broken glass, or the piteous accents of the coolie deprecating master's wrath, protesting he was murdered, or imploring assistance from the governor-general and East India Company, was quite as fatal to 'tired nature's sweet restorer' as the want of cool air.

We accordingly had a tall three-legged stool constructed, on which the coolie on duty was always perched. It gave him great facility in pulling the punkah, and proved an excellent seat as long as he remained awake, and sat upright; but the moment he began to nod, the rickety tripod was overbalanced, and the whole concern upset bodily. This we found a most effectual means of murdering sleep, as, after performing half-a-dozen of these involuntary somersaults, the coolies learned to keep themselves awake, and the punkah going.

Whilst we, in a semi-deliquest state, were endeavouring, by expedients such as these, to render the heat somewhat less unbearable, we were constantly tantalised by seeing the junior ensign in undivided possession of an excellent house adjoining ours, which he did not offer to share with any one.

Young Rooke seemed an ungainly, rather silly lad, without much harm in his composition, or anything aristocratic in his manners or appearance, but with an overweening sense of his own importance. At drill, he was the most awkward fellow I ever saw; it required a couple of sergeants to put him in the proper position of a soldier, and the moment their hands were withdrawn, he relapsed into his usual slouching attitude. He had a habit, too, of knocking one foot against another like a horse cutting, by which he was always losing step; and when he shouldered his musket, it seemed an even chance whether he sent the bayonet into his own cheek or his neighbour's. All rebukes and corrections he received with so well-satisfied an air, that his amendment seemed hopeless; and Wright, our adjutant, was in a state of despair at having such an unpromising recruit to deal with, declaring his life would be shortened by being daily compelled to witness so melancholy a spectacle. Now, next to a pretty girl and a well-drilled battalion, there was nothing Wright liked so much as a joke, particularly a practical one; indeed, he loved it not wisely, but too well, and had often got into trouble by indulging his facetious propensities.

He longed to play off some trick upon Rooke, which might soothe his own feelings, and diminish the other's self-importance, but found it difficult to get an opportunity for doing so, as the youngster seldom came to mess or mixed with his brother-officers, being unwisely kept away by his uncle, the general, which made him even more unpopular than

he would have been at any rate. Accordingly, he gravely informed Rooke, that, as he had got on so far in his drill, it was time for him to proceed to more advanced exercises, and commence learning the drum, for which purpose the drum-major would provide him with an instrument, and attend at his quarters for an hour daily, after morning parade—a private hint being given to the instructor, that the lesson should always be given in the verandah, which was in full view of the mess-room. There we used to assemble every morning for coffee and billiards, but both were neglected for the pleasure of seeing Rooke pacing up and down with a drum suspended from his shoulders, practising the initiatory exercise called 'mammy daddy,' which is, in fact, the *do, re, mi* of all who learn this sonorous instrument.

To explain for the benefit of the uninitiated, it may be briefly described as follows: The tyro's hands being arranged in the proper position, he gives two taps with the right one, then withdrawing it, holds the drum-stick perpendicularly by his side, repeats the same process with the left, and so on *ad infinitum*. It is rather monotonous work, and, at the best of times, makes the performer look rather foolish; but when Rooke's awkward movements and shambling gait were contrasted with the splendid proportions of the drum-major, who owed his situation to the fact of his being the handsomest man in the regiment, the effect was inexpressibly ludicrous, and formed a never-failing source of amusement to those who witnessed it. The pupil, however, had not advanced beyond these elementary studies, when his further progress was stopped by his uncle coming in one day to pay our colonel a visit.

Sir Hannibal Peacocke, like most ignorant men, was very fussy about trifles, and constantly getting hold of some new hobby, which he rode until he tired of it, or some fresh one came in his way. Having that morning mounted a new one—a novel method of putting on the knapsack without straps, which proved a complete failure—he came in to display his equitation for the colonel's benefit. Having taken as much exercise in that way as he felt disposed for, the conversation turned on his nephew, who, the general remarked, he was glad to hear was getting on so well with his drill.

'I am sorry I cannot agree with you, general,' said the outspoken Colonel Hardy, 'for really I never met a more stupid lad in my life; he seems to make no progress, notwithstanding all the trouble taken with him.'

'I am afraid you do not take the trouble of making yourself acquainted with what passes in your regiment,' replied Sir Hannibal, with some asperity; 'for I can tell you the adjutant is so well satisfied with his proficiency, that he has allowed him to commence learning the drum.'

'The drum, general! you cannot be serious; there must be some mistake. Surely no one ever heard of such a thing as training an officer to a bandman's duties.'

'My nephew never told me a falsehood, even in jest, Colonel Hardy; and you will find what I have stated to be perfectly correct, if you ask your adjutant, who I saw writing in the next room when I came in.'

Wright was summoned, and the moment he entered the room, perceived that the conjunction of two such luminaries boded him no good; and augured from the ominous silence which greeted his entrance, that, as he expressed it, the devoted storm was about to descend on his thundering head.

'Have you been playing off any of your jokes on Mr Rooke?' sternly demanded the colonel.

'Jokes, sir!' demurely answered Wright; 'I assure you it is no joke trying to teach a man of his

stamp. I'm nearly heart-broken from him myself; and the sergeant-major threatened suicide if compelled to continue drilling him. I could not knock anything into his head, or out of his heels; so I thought it no harm to try whether his hands could not perform some military movement. He is getting on very well at it; and I am sure the general would be quite pleased to hear the fine tone he brings out of the instrument.'

Had the general not been present, it is probable that the affair might have passed off as a harmless trick; but restrained by this, and a sense of duty, the colonel frowned down his rising mirth, and said: 'You have done wrong, sir, to allow your private feelings to influence you in the discharge of your duty; you have abused the authority I gave you over a young officer, and endeavoured to make him the butt of the regiment. This mock-instruction must be discontinued; and I trust you will see the propriety of apologising to Mr Rooke for what has passed. I trust you are satisfied, Sir Hannibal.'

'No, I am not satisfied; very much the reverse,' said the general, his cholera rising as he became gradually aware of the extent to which his nephew and himself had been imposed on, until between the state of the thermometer and internal warmth, he seemed on the point of spontaneous combustion. 'Go to your quarters instantly, Mr Wright, and consider yourself under arrest.'

Whereupon the culprit left the room without speaking, and the general soon after took his leave, vowing vengeance against Wright; declaring that he would make an example of him, and that he was fully determined to bring him to a court-martial for such outrageous conduct.

To all this tirade, Colonel Hardy wisely made no reply; but, soon after the general's departure, sent him a note, saying that he hoped Sir Hannibal would, on mature reflection, view the case more favourably, as Wright was a young man of excellent principles, and a first-rate officer, though sometimes led away by high spirits; that it would be impossible to frame charges for a court-martial without making his nephew—he did not venture to say himself—the laughing-stock of the service; and, moreover, that if ever the matter came to a trial, he would feel bound to state that Sir Hannibal Peacocke, a general officer commanding a division, fully believed that learning the drum formed an integral part of an officer's education.

By this time, Sir Hannibal's wrath had time to cool; and seeing the cogency of these arguments, he replied that to oblige Colonel Hardy, he would treat the case as leniently as his duty would permit; that Mr Wright might be released from arrest; but as he could not pass over such conduct without publicly expressing his disapprobation of it, the lieutenant in question should attend at the general's quarters the following morning, when, in the presence of all commanding officers and staff in the station, he would receive such a reprimand as the major-general might deem it fit to administer.

Sir Hannibal Peacocke was a particularly neat man; the scrupulous exactness of his person was only equalled by the cleanliness of his house, and elegance of his bachelor *ménage*. Every one else's linen looked yellow in comparison with the immaculate purity of his; a speck on his white trousers, a soil on his boots, a stain on his table-cloth, or a particle of dust on the table itself, made him quite uncomfortable; but the presence of a fly or spider set him well-nigh distraught, and he would interrupt the gravest conversation to make slaps at an intruding blue-bottle, and prided himself not a little on the dexterous manner in which he crushed the offender between his extended palms.

Next morning, at the hour indicated, commanding officers and staff assembled as directed at the general's quarters, all in full-dress, to look as imposing as possible. When Sir Hannibal entered the room, without noticing any one, he fixed his eyes on the wall, which a large speckled spider was slowly ascending on his return from a successful foraging expedition, taking with him a supply of ant-meat for the nourishment of his family.

The bearer, loudly summoned, warily and slowly approached the unsuspecting spider, and when arrived within springing distance, made a dash at it with the cloth he held in his hand; then removing it triumphantly, displayed the crushed remains of the spider, surrounded by a gory stain, on the wall. Instead, however, of the approbation he looked for, his master was so enraged at the mark on his spotless chunam, that he pulled a flash pink turban off the bearer's head, wiped the obnoxious stain with it, then threw it in his face, and kicked and pommelled him out of the room, to the great amusement of those who witnessed this practical commentary on the general's favourite exordium against maltreating native servants.

Then gravely seating himself at the head of a table covered with writing materials, Sir Hannibal motioned the other officers to chairs on either side; and they had hardly time to compose their faces, when Wright entered, looking so preternaturally solemn, that any one who knew him, would at once have suspected there was some mischief brewing.

Knowing Sir Hannibal's entomophobia, he had employed some of his spare time in capturing a number of flies and immuring them in a paper-box, perforated with innumerable pin-holes, in order to keep its inmates in a state of active vitality.

This he held inside his shako with one hand, and by keeping his finger on an orifice in the lid, let them escape when he wished. The general, not being gifted with much extempore eloquence, had written the wiggling he intended to administer, and now commenced reading it aloud.

'Lieutenant and Adjutant Wright, I regret'— Buzz, buzz went an audacious blue-bottle within an inch of the pretorian nose. Slap, slap from the general, and the enemy retreated in good order, leaving him master of the field.

He had hardly recommenced reading, when he was again interrupted in a similar manner; but this time he had better success, for the intruder was destroyed.

Complacent at the successful result of his *coup de main*, he made a third essay.

'Lieutenant and Adjutant Wright, I regret to find that'— Here a score of flies, rampant from their newly acquired liberty, made an onslaught, together with such a briek hum of insolent defiance, that, dropping the paper he held, the general vigorously smote the air, in a vain attempt to rid himself of his persecutors.

Imitating the example of their chief, the other officers rose to assist him in banishing the unwelcome visitors.

Furor arma ministrat; each seizes what he can lay hold of—books, cocked-hats, and hand-punkahs are converted for the nonce into fly-flappers. A dragon major, more zealous than skilful, grasped a long ruler sabrewise, and making 'cut two' in most approved style, missed the blue-bottle, and nearly felled the garrison-surgeon, whose bald head it encountered in its descent. The adjutant-general, in making a vigorous sweep with his arm, knocked off the commissary's spectacles; and the latter functionary, purblind from their loss, and surprised at such an unlooked-for assault, upset the ink-bottle in groping to recover them, dashing its contents over the formidable foolscap whereon the reprimand was written,

and extending its ravages to the snowy integuments which covered the general's nether man.

Solvuntur tabulae risu. Such a scene of confusion ensued, that Sir Hannibal, finding it impossible to restore order, dismissed all present, intimating, however, at the same time his intention of reassembling them at some future time for the same purpose.

It would seem, however, that a convenient time for the purpose never came, as no one ever afterwards heard Sir Hannibal allude to the subject; nor, stranger still, does any mention of it appear in the life and memoirs of that gallant and distinguished officer, published after his lamented decease, several years subsequently, and it has consequently remained unchronicled up to the present moment.

THE LATE SAMUEL BROWN.

WHEN a brilliant and powerful intellect has passed away without leaving any written works behind, it is difficult to make the world believe in what it has lost. The deep and subtle influence which a great man leaves on other minds by personal association, can neither be told nor accounted for; and those who loved and honoured the dead, must be content with their own profound conviction of his greatness. But the case is even harder when something is left—good, indeed, and precious, but utterly inadequate as the expression of the power or possibilities of the writer. To leave such fragments uncollected, and suffer them to be lost among the mass of ephemeral literature, would be wrong; but to have them set up as the measure of their author's mind, would be still more unjust to his memory. The difficulty of deciding between these two risks must have been felt by the editors of these Essays; for, beautiful and interesting as they are, they are infinitely below what Samuel Brown might and would have done; and it would be most painful to those who eagerly watched the promise and growth of that noble intellect, to think that these few and scattered utterances should be in any way looked upon as its whole result.*

In the generality of obscure geniuses and possible great men, common sense refuses to believe, and most justly; for it is a second-rate talent only that needs to be nursed by circumstances into greatness. If there be one spark of the real divine fire of true genius, it can never be quenched by external conditions; poverty only braces it—contest only rouses it—sorrow only purifies it—and, sooner or later, it will find its appointed mode of expression. But over genius itself, disease and death are victorious; and Samuel Brown was early called to a martyrdom that only ended with his life. After a youth of strenuous labour and extraordinary attainment, just when his mental powers were matured, the instruments of knowledge within his grasp, and visions of long-sought truths opening brightly before him—then came the fatal disease which held him fast for ever. From this time, says the preface, 'and till his death, seven long years, he was probably never for an hour, except in sleep, free from pain, and often in extreme agony—his existence being little else than the fulfilling of his capacity for suffering. When in Russia, he had typhus fever; and it is likely he never was sound afterwards, and carried his death within him in the form of an internal disease, necessitating pain of the sharpest and steadiest kind. He died in the full exercise of his intellect and affections, having fought his disease to the last.'

How nobly he bore this stern fate, how brightly the soul shone out through all these clouds of suffering, how humbly and thankfully he spoke of all the deeper

things that pain and trial had taught him, cannot be told here. But there are many who look back to his example with loving gratitude, and treasure his words in their inmost hearts as a precious legacy of strength and consolation. 'How pathetic to think that this intense and bright nature—

Appearing ere the times were ripe—

should so "soon come to confusion," that he should suffer as he did, and die with little else fulfilled but pain—his hopes withered, his secret purposes broken off, his years unaccomplished, fame and a great place in the world's history, merely seen from under the opening eyelids of the morn, and then vanishing away; his sun going down while it was yet day; the tree of mortal life withering in all the leaves of his spring—all this is strange and sad; but what in this world has not in it something both sad and strange?'

Thus much it seems necessary to premise before speaking of the merits of these Essays, for some of them were written in extreme youth, and while they overflow with its fire and generosity, they also bear the marks of it, in occasional rashness of conclusion and extravagance of words. Others were composed in the rare intervals of comparative ease which occurred during his last years of suffering and weakness, and we can but look with tender admiration on the spirit which could so far overcome pain and exhaustion as to write them at all, while we wonder at their brilliancy and power. The range of subjects they embrace is very wide. Though science has the larger share, art and poetry are treated of with the insight that comes only from sincere love and feeling. A few of his own poems are in the first volume, and are very pure and fine; but it is rather in his prose writing we feel what a true poet he was. There the bright imagination continually lights up the sternest subjects, not with conscious rhetoric or fine writing of any sort, but with a pervading feeling for what is lovely and picturesque, and the fine instinct which seizes the noblest and most poetic aspect of everything, and revels in it with that enthusiasm which never fails to awaken a corresponding delight in the reader. It is the mixture of poetic feeling and calm reasoning which gives its chief charm to the book.

The first volume is mainly devoted to the history of chemical science, and part of it is a sort of reproduction of the brilliant lectures which Dr Brown delivered in Edinburgh in 1849, and of which those who heard them will be glad to be reminded. However unacquainted with science the reader may be, he will find in the series of Essays which commence with 'Alchemy and the Alchemists,' some of the most fascinating sketches that can be conceived. 'The playful and apparently unsuccessful childhood of chemistry may be said to have passed among those young-souled Greeks from whom phlogiston came down. They asked such profound questions of nature that they could not understand her motherly responses, yet the very putting of those questions foreshadowed the whole history of the science. Its busy but little-doing boyhood was spent in the east, under califs and physicians whose very names are fragrant with romance; its ardent and imaginative pubescence, in the unbroken Christendom of the middle ages, amid the hum of scholasticism and under the shadow of Gothic architecture; and we have just seen something of its sturdy youth of somewhat positive effort during the reign of phlogiston. The fifth of its ages, that of victorious and self-confident manhood, now offers itself to the attention of the historical student.'

Along this pleasant path, so full of variety and interest, we are carried in a series of vigorous and characteristic descriptions of the lives and labours of workers in chemistry, beginning with the Greeks,

* Lectures on the Atomic Theory, and Essays Scientific and Literary. By Samuel Brown. Edinburgh: Thomas Constable & Co.

and then pausing among the oriental alchemists, whose mystical theories have caused their earnest investigations of natural facts to be undervalued—'sincere, devout, industrious men, who, toiling away among their crucibles and furnaces, discovered many new facts and new processes, and did many a good thing;' and next, among their European successors; where, foremost in his own school, and mighty among all schools of natural science, in all time, appears the great name of Roger Bacon, one of whom England has just cause to be proud; but his legendary fame as a magician has eclipsed his true glory as a man of science. That he believed in the elixir of life and the philosopher's-stone, like the rest of his contemporaries, is confessed, but he did not devote himself to searching for them; and 'in truth,' says Dr Brown, 'we should never look at the little particular beliefs and notions of great spirits in the history of science, but to their great ideas, otherwise we shall run the risk of despising men so exalted in character as to remain for ever incapable of despising us.' And again: 'There is indeed no room for national or epochal vanity in the study of the history of science; there is rather occasion for humility and emulation; for those old men worked with grand ideals and small means upon an obdurate and an unbroken soil, while we stand on fields which they have ploughed, armed with an elaborate instrumentation, and too often guided by ideals which savour more of the shop than of the universe.'

The sketches of Paracelsus and the rest of that race are vivid and interesting, but they cannot be quoted without spoiling them; for the history must be read as a whole, and the thread of their real discoveries followed, as it runs bright and clear through the strange webs of their romantic fancies, and still more romantic lives. In the next essay on 'Phlogiston and Lavoisier,' we pass through another long epoch of true experiment and mistaken theory, and read the stories of Beccher and Stahl, Priestley and Cavendish, Black and Watt, till the young Lavoisier appears, with the inexorable balance in his hand, to change the whole form of chemical science; to open a new path to all succeeding philosophers, and to perish in the very midst of his labour, and in the zenith of his powers; one amongst a batch of victims in the high frenzy of the first French Revolution. The two or three pages in which his short life is related are full of pathetic beauty. A brilliant and genial essay on Sir Humphry Davy, full of cordial appreciation of his character and discoveries, worthily completes this striking series, and is in itself a delightful piece of biography. With one more short extract, we must close this volume:

'There are poets who wonder at the spectacle of such keen spirits as Humphry Davy, for example, labouring with might and main at the dry births of stone and iron, when they might well be abroad among the strong and the beautiful, stirring the life of man in its august depths. But a man must work where he is placed; and he must also obey the hint of his peculiar talent, else he will never do the most he can for the race and for himself. These are two of the great rules of duty. There is little matter what a man finds to be his proper task, so he rest not until he have won all it can teach him; so he relax not until he have made the most of it for the world; so he relent not before he has adorned it with his proper virtue, and ennobled it by his proper genius. Truth is a globe like the world; and it is of small moment where you begin to dig, for you will come as near the centre as another, if you dig deep enough. It is at the same time an important, though a secondary duty of the industrious miner, to ascend every now and then from his particular shaft, both to see what others are about, in case he should become the

egotist of a single pursuit, and to refresh himself with the inexhaustible variety of nature and of life.'

The rest of the Essays are on a great variety of subjects, and we can do little more than name a few of them. Among the most interesting are those on George Herbert's poetry; on 'Physical Puritanism,' including vegetarianism, hydropathy, &c.; on David Scott the painter, a most touching account of that great but wayward genius, who, like Samuel Brown himself, died before he had accomplished half his work; as a tender and friendly memoir of the artist, and as a piece of general art-criticism, it is a striking and excellent essay. 'Ghosts and Ghost-seers,' the last of the Essays, is also one of the best, and contains some of the most striking remarks. How true and well put is the following:

'Few people are aware of the extreme difficulty of the art of simple observation. That art consists not only in the ability to perceive the phenomena of nature through uncoloured eyes, but also of the talent to describe them in unobstructed and transparent words. To observe properly in the very simplest of the physical sciences, requires a long and severe training. No one knows this so feelingly as the great discoverer. Faraday once said that he always doubts his own observations. Mitscherlich, on one occasion, remarked to a man of science of our acquaintance, that it takes fourteen years to discover and establish a single new fact in chemistry. An enthusiastic student one day betook himself to Baron Cuvier with the exhibition of a new organ—we think it was a muscle—which he supposed himself to have discovered in the body of some living creature or other; but the experienced and sagacious naturalist kindly bade the young man return to him with the same discovery in six months. The baron would not even listen to the student's demonstration, nor examine his dissection, till the eager and youthful discoverer had hung over the object of inquiry for half a year; and yet that object was a mere thing of the senses! In a word, the records of physical science are full of instances in which genuine researchers—men formed by nature and trained by toil for the life of observation—have misstated the least complicated phenomena. Nor would the intelligent public fail to be amused, as well as astonished, if they only knew how very few of the noisy host of professing men of science, in even this matter-of-fact country, ever discover a single new fact; ever describe with irreversible fidelity a new phenomenon of any significance; ever add one true word to the written science of the world.'

With these words, important to every aspirant after real knowledge, and to every lover of exact truth, we take leave of this remarkable book, earnestly commending it to a close and attentive perusal.

THE CHANNEL BRIDGE.

ONE of those little difficulties which are common to the matrimonial state, even among the best regulated couples, are constantly occurring between my wife and me with regard to a continental tour. So surely as the autumn shews its face, she wants to visit that 'dear darling Paris,' or that 'exquisite Chamouni,' or some other absurdly belauded spot beyond the sea, instead of being content with the bracing airs of Brighton, or the yellow sands (and slippers) of Margate or Ramsgate. She affirms that there are no dresses to be got in Regent Street fit for a lady to wear, and no mountains worthy of the name to be seen in all Great Britain. To this I reply, that if such be the case, she must abandon her outer garments altogether, and content herself with a comparatively level country, for that out of England, or I'm a Dutchman, she does not get me to stir. Now, the true reason of this I do not care to own to her, and shall therefore

carefully keep this particular Journal out of her sight; but the fact is, that I become so absolutely and hopelessly wretched so soon as I set foot on board a steamer, that I am well determined never to encounter the misery of it again. Of course, the sea has a good deal to do with it; but the steamer—the rolling, the throbbing, the heat, the panting of the steamer—is quite sufficient for this result, without the sea. I am rendered intellectually an idiot, and physically a helpless log, from the instant the terrible yell of departure is raised by the escape-valve, and when the first half-turn of those hissing wheels gives me a whole one.

The arguments I address to her ear are national and patriotic; such as, how right it is that every Briton should spend his money in his own country, and by no means pour it into Frenchmen's pockets; with other even nobler sentiments, which I have culled diligently from the newspapers of my native land; but my real and sole objection—which I keep, as I have said, in my private bosom—is simply to the sea-passage, the crossing of the Channel. I know that she who 'halves my sorrows, and doubles my joys,' as the poet satirically sings, would urge—before she gave up the contest as hopeless, and began to call names—that it was 'only a little suffering after all,' and 'the inconvenience is over in no time,' and I should not be able to convince her to the contrary. The term 'suffering' does not in the least express the mental and bodily agony of my position on ship-board; and after I land—after I have been carried on shore laminate—I don't recover for a week.

'Never,' quoth I, the last time I was dropped like a sack on Folkestone pier—'never, if I know it, and remain in my right mind, do I catch myself on board ship again.' This resolution I have kept, and mean to keep; but yet, may be, I may take my wife to Paris nevertheless.

The French engineer, Mathieu, so long ago as the First Consulate, and when railways were entirely unknown, considered the scheme of a roadway under the Channel practicable, and laid it before the great Napoleon. More recently, other Frenchmen of science have proposed various plans for land-communication between England and France, under much more favourable circumstances. One of these ambitious projectors has within the last few months procured for himself something more than interest and attention. A commission of eminent engineers appointed by government to report upon his stupendous theory, has returned a favourable verdict. It has, moreover, recommended that twenty thousand pounds should be granted for experimental examinations. Finally, and above all, Napoleon III. is a believer in the matter himself. The submarine ground has been accurately surveyed already, and nothing is wanting but the following little preliminary arrangements to the tunnel of M. Thomé de Gamond. His scheme is doubtless worthy of our highest admiration, but still I cannot dismise from my mind his aristocratic name. What chance, I wonder, upon this side of the Channel, would an engineer of the name of Tommy Gammon have, who proposed such operations as these:

To tear up rocks, and having carried the same out to sea, to drop them in the Channel.

To form thirteen islands in that fashion in the said Channel.

To dig down through the above islands into *terra firma* under the sea, and there to begin the tunnel, east and west.

There are a few other difficulties to be overcome, whereof one is the formation of a sort of Swindon Station in mid-channel, with a well-staircase leading up to an artificial island in the open air; but they are scarcely worth dwelling upon in comparison with those we have mentioned.

The great objection which attaches to M. de Gamond's tunnel, in connection with the trip of myself and my wife to Paris, is, that I know she will never be got by any means to travel by it. She will not even go to Bath on account of the excitement, between our home and that city, of the Box Tunnel. Her behaviour during any subterranean passage—whenever I have caught a glimpse of her by light of lamp or shaft—is ridiculous, and personally uncomfortable in the extreme. She shuts her eyes very tightly, takes her under-lip between her teeth, puts a finger into each of her ears, and, in short, assumes a state of physical tension, which it would be impossible for her to maintain during half the time consumed by this proposed subterranean journey. As far, therefore, as we two are concerned, M. Thomé de Gamond might just as well never have existed; but I am by no means inclined to say the same of Mr Charles Boyd, of Barnes, Surrey, the projector of the *Marine Viaduct*, or *Continental Railway Bridge*. I have his pamphlet now lying before me, written with all seriousness and gravity, and with a charming section of the viaduct, by way of illustration, on the scale of an inch in a hundred feet, and showing the greatest depth of the Straits of Dover, and the relative space afforded for the passage of shipping. The book is of a yellow cover, like a *Bradshaw*, and of so amusingly convincing a character, that one is quite disappointed not to find the hours of starting of the super-charged trains, both ordinary and express, week-day and Sunday, at the end of it.

The marine viaduct will consist of a succession of tubes 50 feet deep by 30 feet wide, made of wrought-iron, riveted and braced together, interspersed with ventilators and sky-lights, and supplied with the ordinary lines of railway within. This is to be supported by 190 towers, and to be raised, one tube at a time, to the required height of 300 feet above the level of the sea, by means of hydraulic machinery placed in pontoons. This great elevation will admit of the passage of the tallest ships in the highest tow, with 45 feet to spare, in case of vessels being built of unprecedentedly large dimensions. The space between the towers will be sufficient not only for three line-of-battle ships to sail through abreast, but even for three *Lazavathans*, should so many good brethren ever chance to be keeping such close company. Each tower will be of 100 feet in diameter, and, after rising upon its pedestal 260 feet, is to be continued 60 feet above the viaduct for the formation of a light-house, and again 60 feet higher still for use of a belfry or gong-tower, and for a central air-shaft for the viaduct.

These light-houses, whose illuminating surfaces are to be forty-three feet in diameter, are to reflect a bright red light on the south side, and a vivid blue one on the north, in order that vessels may clearly ascertain their own position with regard to the Channel Bridge. The belfries will hold a gong—a bell not being loud enough, and a whistle liable to be confused with that of the steam-engines—to be struck by a hammer propelled by clock-work. The light-houses are to be lit up at sunset throughout the entire length of the bridge by electricity, and the same power will set the gongs sounding in case of fog. All the towers are to be fitted at water-mark with fenders, consisting of spindles of wrought iron, very thickly coated with India-rubber, and made to revolve vertically in an iron framework attached to the tower bases, in order to repel collision; so that any vessel conceiving and at right angles with the fender, would be simply sent on her way. The towers are to bear the arms of France and England alternately; and in summertime, on occasions of any increase in the Napoleonic family, will, I daresay, be tastefully decorated with flowers. Thus far, every part of the scheme looks

not only practicable but alluring—only we have yet to inquire, 'upon what are these towers which support the viaduct to stand?' This, as it seems to me, is an almost insurmountable difficulty, but not so does it seem to Mr Boyd. He proposes to form, as foundations for these towers, enormous pedestals, which will be formed by sinking into the bed of the Channel blocks of stone each of several tons' weight, securely riveted through their centres with iron bolts, and with their connecting faces strongly cemented, so that a succession of blocks will form one ponderous and immovable mass. The operation of placing them—this art of sinking—is to be conducted by means of machinery on board ship, or on pontoons at anchor; 'so that each block may gradually sink therefrom into its proper place below, first ascertained by the compass-bearings on deck, and by divers, who will be employed with diving-bells to examine the bed of the channel, to arrange, secure, and connect the blocks and other materials as they descend: and who are to communicate with the workmen on board by signal-lines and speaking-tubes. In addition to the blocks so placed, strong iron grapples chained together at short distances apart will be fixed around and to the base of the pedestal, to prevent any movement of the blocks when once in position.' The bases are to be 300 feet square, and the pedestals will gradually rise at an angle of 75 degrees until they reach the level of the sea, and there form an insular plain 40 feet high by 150 square, for the reception of the tower. The French terminus—as in M. Thomé de Gamond's plan—is to be at Cape Grisez, which, however, being only 147½ feet above the sea, will require to be brought to the same elevation as the English terminus at Dover, of 300 feet.

'To relieve any anxiety that may be entertained by the proposed union of Britain with the continent, it is intended that the English approaches shall be commanded by the batteries of Dover Castle, and that a battery shall be erected to cover the French terminus, as a part of the viaduct could then be suddenly disconnected without damaging the whole structure; and when hostility ceased, the injury done might be repaired in a few weeks, and the traffic be readily resumed—an arrangement for destruction and reparation which seems to me to be a very pleasant satire upon war.

By the detailed official statement of the commerce between the United Kingdom and the continent, and by the calculations made thereon by Mr Boyd of the probable sources which will make his marine viaduct their channel, it seems that the necessary outlay for this ambitious project will be returned to an enterprising company in eight years; the various items of each outlay being nicely estimated to a pound, and amounting in the aggregate to the trifling sum of thirty millions.

'It is calculated that the entire structure can be concluded and thrown open to public traffic in three years, as the whole of the pedestals, with their assigned towers, can be erected simultaneously; the workmen being lodged upon, or rather over, the spot which is the scene of their labours, in vessels prepared for that purpose. The tubes may be also constructed simultaneously upon shore, so that the entire edifice may be erected almost in the same space of time which is devoted to one pedestal, tower, and intermediate tubes.

Finally, says Mr Charles Boyd, 'This bridge will form the high road to Europe, India, China, and all parts of the Mediterranean, and testify to the World, by its visible presence, the Power and the Unanimity of the greatest Nations of the Earth; in addition to which—to descend to small letters and the practical—there will then be some probability of my wife and myself recrossing the British Channel. The fact of the light of the sun illuminating this viaduct by day

seems to be of great importance in the sense of comparative safety it will convey to the passenger; while the circumstance of it being admitted through a sky-light will prevent him seeing the horrors of his way, and also, perchance—for a glimpse of the tossing ocean would be sufficient for me—from getting seasick. For persons of stronger stomachs, there might be easily constructed a promenade—protected, of course, by balustrades—above the viaduct, where sea-air might be imbibed as on a pier, at a certain charge, or which might be used by an active pedestrian instead of the railway; a turnstile being placed at both its French and English terminations, as at the Middlesex and Surrey ends of Waterloo Bridge.

HINTS TO NOVELISTS.

THE novelists are, after all, 'dull dogs.' Travelling in one continual narrow round of characters and relations of character, they never observe the infinite variety of others which go to form the web of society. Always, with them, the rich man is an oppressor or a fool, and poverty the inseparable associate of talent, learning, and virtue. Always the new rich man is vulgar, and a despoiler of all left behind him in the race; always the governess a paragon of the amiable and accomplished, amongst mean, harsh, ungenial employers; though, strange to say, when she sets up a boarding-school, she is just as sure to be a grasping, pretentious, hypocritical, pupil-starving humbug. A person bearing the name of step-mother never can do anything that is right. In an action at law, justice, as a matter of course, is exclusively on the side of the party whose circumstances are the meanest; only, law being so costly, the really poor man seldom gets his rights advocated. It is almost absurd to insist how partially all such things are true. Yet we may just take leave—for the information of these slaves of the conventionalisms of their art—to assert, that we continually meet rich and titled men who are neither fools nor oppressors, and generally find talent, learning, and virtue in tolerably good worldly circumstances; that our experience finds self-raised men often possessed of the most cultivated tastes, and rather humble in mind and modest in their social predilections, even where their origin is not generally known; that, singular as it may appear, a governess is now and then unreasonable in her expectations amongst people immensely her superiors in both amiableness and accomplishment, while, on the other hand, the mistress of the 'institution for young ladies' is frequently a painstaking, conscientious, and essentially kind-hearted woman struggling with a thankless profession. So also step-mothers in real life, so far from being necessarily harsh to the young brood they have adopted, are often only too kind and forbearing, as fearful to abuse that power in correction which a real mother would have used unsparingly. So also, we have known poor people prosecuting unjust or imaginary claims at law, and thus inflicting infinite annoyance and damage upon rich people who had been their best benefactors. In all of these actual relations of life there is surely a rich fund of new material for the fictionist, if he would open his eyes and see it. Why does he not give us, as a new kind of comedy, some of the persecutions and hardships suffered by rich people? Why should we not have from him a tragedy founded on the sufferings which a jealous, rancorous mother—for such a character exists—has it in her power to inflict upon her children? A well-treated governess who *would* be unhappy, a kind step-mother, a worthy boarding-school keeper, a penniless raiser of vexatious lawsuits—all of them creatures of frequent occurrence in actual life—are all perfect novelties

in fiction, and would therefore be sure of a good reception.

One part of the principles of social life, which has never been apprehended by novelists, and is little observed by men generally, but is a most important thing in our ordinary experiences, is that regarding the feelings which actuate us in the formation of acquaintanceships and friendships. There is here not merely ignorance, but much positive mistake. When Smith and his family decline the offered society of Jones and Jones's family, there is never any other presumption in Jones than that Smith has been determined in the matter wholly by some external considerations, as that Jones is a man of comparatively little means or influence, and that there is to be nothing gained in the eye of the world by knowing him. When Brown chances to be drawn on by fortune to a prominent and brilliant position, and gets new friends, then are all his old ones jealous if he abates in the least in the attentions he formerly paid them, as understanding that he now looks down upon them. Now the truth may be, nay, generally is, that Smith finds Jones and his connections unfitted to his tastes, or moving in a wholly different round of sympathies and interests, and very naturally reserves himself for friends who are in these respects more suitable. So also when Brown's position in life is changed, he necessarily comes into contact with new people, who must in a great measure engross any time he has to bestow on social pleasures; without any failure of good feeling towards old acquaintances, he cannot give so much time to them, perhaps cannot give any; one thing, in short, is superseded by another. Or with changed circumstances have come changed tastes and new sympathies; so he no longer finds the enjoyment he did in the society of those old acquaintances. Surely, in a world so full of change, this should not excite very much surprise. And there is surely no great difficulty in seeing how it all comes about. Community of tastes, sympathies, and interests mainly determine us in all these matters. Yet there is no subject on which the truth seems more screened from the common view.

For much of what is complained of in the common world on these subjects, there is a ground in rationality, if our self-love would only allow us to see it. When Hugh Miller rose from his original condition of a stone-mason to be a leader of public opinion and a cultivator of literature and science, could his old fellow-workers have reasonably expected him to associate as much with them as ever? No one who knew the man can doubt that he would continue to regard them with kindness, that he would be willing to help and serve them within reasonable bounds, and that any particular old favourite would be as sure of a shake of his horny hand as ever, when accident threw them together. But it was manifestly impossible for Miller to be both what he now was and what he once was: Circumstances were changed, and he was changed with them. He had new associates, suitable to his present frame of intellectual and moral being, and he could not also keep up on the original terms with the old, for the two were wholly incompatible. It chanced that another man of genius, who rose about the same time from humble life to an equally high level in one of the fine arts, endeavoured, from a misjudging good-nature, to keep up with his old associates, instead of adopting new ones more suitable to his altered circumstances, and the consequence was that he got into wholly false positions, and was utterly deranged in his course of life. In an early state of society, such a man would have been quite safe with all his genius and its *éclat*; but the world chances to be some thousands of years old, and it has in the course of time crystallised into social

forms and rules which we cannot transgress with impunity.

There is, we suspect, another mistake in the views of Mr Jones and his compeers on matters of this kind. He considers Smith as having been formerly on his own level in mind and tastes, as well as in worldly circumstances, and complains accordingly as if there were no cause for the alienation but a change in the latter. But perhaps Smith was all the time a man of higher powers as well as higher tendencies, thrown by the mere accident of fortune into Jones's society, and good-naturedly to a certain extent enduring it, while aspiring to something better. The very progressiveness of some men, as compared with others, progressiveness in tastes above all, would account for much of that gradual separation which is continually seen taking place between them, without the necessity of presuming any lack of constancy or of kindly feeling in one of the parties.

It is strange, while by our adage, 'a man is known by his associates,' we practically acknowledge that men choose their society by elective affinity, and have a right to do so, that we should at the same time leave our neighbours so little freedom in the choice. There is no privilege of humanity in which there is more interference, more foolish censure, more want of reasonable judgment. Poor Smith and his woman-kind cannot make a single move in the social world, but the Joneses are upon him, misconstruing all his motives and aims, and this for no observable reason but that the Joneses would believe in anything before they would believe that there was any point of intelligibility about themselves. Mrs Smith never projects a dinner-party in perfect freedom. 'We have not room for the Joneses; they might be asked at another time; but then they will take offence if omitted from a party where we are to have the Browns—they will think it is because the Browns have got a rise lately, and are thought their superiors.' So the plan of the party—and a party, to be successful, demands a plan—has to be deranged and probably spoilt, in order to avoid giving offence in a quarter where there was no real occasion for taking it. Unfortunately, the acquaintances least appreciable for any attractive qualities, are just those who are always on the most ticklish terms with us, and therefore the most liable to be offended by any imagined slight; hence the most tyrannical over us, if we are good-natured enough to study and concede to them.

We are disposed to form acquaintances under the influence of the elective affinity, and we have to bear all the consequences of being presumed to do so; but in how many cases have we our associates assigned to us without any choice in the matter! Our son, while absent with his regiment, marries a thoughtless girl of mean tastes and ideas, with whom the circle of her husband's relations can never be harmonious. Old Tomkins foolishly takes a second wife, whom he imposes on his grown-up children as a person they must respect, the fact being that, while having some inscrutable charm in his eyes, she is disagreeable in those of most other persons. Brothers and sisters bring wives and husbands into the field, whose affinity of feeling with their new relatives is a mere matter of chance: they may or may not be 'pleasant people.' Your partners in business bring you associates, who are not to be avoided, however much they may be disrelished. In such ways you become half-surrounded with people whom you would never think of choosing as friends from any community of sympathy or taste, or from any approbation or esteem. There is here matter for much serious consideration—how to 'get along' with all these associates of accident. It is to be feared that the getting along is often of a halting kind, and that from this cause mainly spring those family quarrels which are remarked to be so much

bitterer than others. It would require great judgment, great patience, great good-nature, to steer well through such difficulties, even where there are respectable qualities on both sides. Where it is otherwise, or even where there is simply a decided antagonism of disposition, the matter must be all but hopeless. Still we cling to the belief that a Christian tolerance—a subjection of the passing feelings to the rule of a high moral principle—a higher kind of good-breeding—will avail much in softening away the worst difficulties of the kind.

Is it want of width of view that is the matter with the novelists, that they let so much of both the comedy and the tragedy of real life slip past them unworked up? Or is there something owing to the exigencies of art? Is it imperative that we always see, in their pages, the gifts of fortune avenged and redressed on a principle of contraries? Is there something in the mysterious abyss of human sympathies and antipathies, that makes us demand ridicule for the keepers of boarding-schools, a hateful description for a step-mother, and a pattern case of justice for a poor man at law? Perhaps so. But, if so, then we must pronounce that 'veluti in speculum' can never be an applicable motto for a book of fiction.

A YARN ABOUT SPINNING.

SOME five-and-twenty years ago, when the reform agitation was at its height, we chanced to be in a small country town in the west of Scotland on the very day when an open-air meeting, followed by a grand procession, was held in favour of the popularly desired measure. Previous, however, to the procession starting, a hitch took place in the proceedings, caused by a difference of opinion on the important question of precedence. The gardeners, as 'old Adam's likeness,' claimed to lead the van, on account of the antiquity of their calling. On the other hand, the tailors, claiming a still higher antiquity, insisted on their incontrovertible right to the post of honour; asserting that Adam was not required to cultivate the earth until his expulsion from the garden of Eden, whereas, previous to that time, he had exercised the craft of a tailor, by sewing a garment of fig-leaves. Long and wordy were the arguments; both sides displaying that thorough knowledge of the sacred writings, which no other people possess in so remarkable a degree as the Scotch. At last, whether by dint of argument, numerical force, or their evident desire of pugnaciously pushing the dispute to the *ultima ratio*, the tailors gained their point, and, with waving banners and sounds of music, the procession started.

That the arts of obtaining food and clothing have been practised from the earliest period, is a mere common-place truism known to all. Yet, while willingly admitting the great antiquity and usefulness of both gardeners and tailors, we must, nevertheless, assert that the human race is much more indebted to the spinsters, who, making the first advances in civilisation and refinement, relieved mankind from the necessity of wearing either leaves of trees or skins of beasts. Nor has the world been forgetful of the boon thus conferred upon it. The literature, proverbs, customs, superstitions, habits of thought, and modes of expression of most nations have reference to this important fact; while the distaff and spindle have been the type and symbol of female industry, and the natural insignia of the softer sex, in nearly every age and country.

Among the many popular fancies of the middle ages, there was none so widely spread, or so firmly held, as the belief that Eve, the mother of mankind, was the first spinster. Those most mendacious of humbugs, the old heraldic writers, unblushingly assert that the shield and lozenge, the distinguishing armorial symbols

of male and female, were severally derived from Adam's spade and Eve's spindle. The lines,

When Adam delved, and Eve span,
Who was then the gentleman?

formed the rallying-cry in many popular insurrections, as the people began to discover their own strength, and the hollow weakness of the feudal assumptions under which they were enslaved. The expulsion of our first parents from the garden of Eden was a favourite subject with the medieval sculptors and painters; and they almost invariably represented it in the following manner. Adam, as he passes out of the portal of the earthly paradise, receives, with an air of the most abject submission, a spade from the hands of an attendant angel; while Eve, already supplied with spinning materials, and apparently quite unabashed, holding up her head as if she had done no wrong, boldly struts forth, carrying her distaff, and twirling the spindle as she walks along. This bold demeanour, attributed to Eve, may be one of the unjust and petty slurs against the female character which the artists of the period delighted to perpetrate; or it may denote her confidence that the evil would eventually be remedied, that through her progeny the serpent's head would ultimately be crushed.

In one of the old religious plays, annually acted by the Franciscan friars on the festival of *Corpus Christi*, we find the same popular idea dramatically expressed. In the scene of the expulsion, Adam, with spade in hand, addressing Eve, says:

Let us walk into the land,
With right hard labour our food to find,
With delving and digging with my hand,
And, wife, to spin now must thou fend,
Our naked bodies in cloth to wind.

Eve, with her distaff and spindle, suiting the action to the word, and the word to the action, replies:

Alas! that ever we wrought this sin—
Our bodily sustenance for to win,
Thou must delve, and I must spin.

The allusions to spinning in the sacred writings are numerous and appropriate, pointing to the great antiquity of the art, as well as eulogising its professors. Abraham refused to take a thread of the spoil; flax was cultivated in the time of Moses; the women that were wise-hearted spun with their hands; those whose hearts stirred them up in wisdom spun goat's hair; and she, the virtuous woman *par excellence*, whose worth was above rubies, laid her hands to the distaff and the spindle.

By the classical writers of Greece and Rome, Minerva, as the instructress of man in the useful arts, was fabled to be the inventress of spinning. Homer speaks of a distaff being a present fit for a queen; and everybody has heard of the labours of Penelope, though Valerius, in *Coriolanus*, spitefully enough, says, that 'all the yarn she spun in Ulysses' absence only served to fill Ithaca full of moths.' Herodotus relates a pleasing story respecting the removal, by Darius, of the Pæonian and neighbouring tribes to the shores of Asia. The Pæonian brothers caused their sister, dressed in her best attire, to pass before the Persian monarch, carrying a vase upon her head, and a distaff in her girdle, and leading a horse with her left hand, while she twirled her spindle with the right. The king's attention being attracted by this unusual appearance, he kept the young woman in view, and saw her approach a fountain, fill the vase, water the horse, and return spinning as before. Darius immediately asked to what country she belonged, and was told Pæonia. Were all the females of that country equally industrious? he next inquired, and was told that they were so. The result was that the politic

monarch, considering that so diligent a people would be valuable subjects, had them all transported to his own territories in Asia.

Pliny tells us that the distaff and spindle of Caia, the queen of Tarquinius Priscus, was long preserved in the Temple of Fortune. This royal spinstress was considered to be the perfect model of a good wife; hence a distaff, charged with wool, and a spindle, were carried before a Roman bride; and when the marriage-procession reached the husband's house, she was asked her name, to which she replied Caia. The three Fates, who, according to the ancient mythology, presided over man's mundane existence, were spinners; one held the distaff, another spun, the third cut the thread of life. Catullus, however, in his beautiful poem on the marriage of Peleus and Thetis, describes all three as spinning. Affording an accurate description of the ancient mode of using the distaff and spindle, the lines are interesting:

And as their hands the sacred labour plied,
The left the distaff grasped, the right hand drew
The wool from thence, and twisted in the clew,
On the bent thumb the winding spindle held,
And as the whirlwind moves its course impelled.
Still as they spun, they bit off every shred
That roughly hung about the new-made thread.

A picture of Leda, on the wall of a house in Pompeii, represents a female spinning in exactly the same manner as is described by the above lines; and the peasant-girls of Italy still carry the distaff and twirl the spindle, as they did in the time of Caia. Yet, long 'ere Romulus and Remus had been suckled,' as we learn from paintings in the tombs of Beni-hassan, the yarn for 'the fine-linen of Egypt' was spun in the same manner; and so do the wretched ophthalmia-stricken fellahs of Egypt still spin in the shade of the great pyramid. Mummy has become merchandise, Pharaoh has been sold for balsam, and, as that has gone out of fashion, even, the eagle and fasces, symbols of imperial dominion and consular power, have long since been swept away; but the distaff and spindle, emblems of domestic peace and household cares, still remain. Their history, if it could be written, would be the history of the human race: the same aims and aspirations, wants and wishes, hopes and fears, have been experienced by millions of the various nations, tribes, religions, colours, and tongues, who have used these simple implements.

Among our Saxon ancestors, the terms *spear-half* and *spindle-half* expressed the male and female lines of descent; and in their tombs, we find a spear beside the skeleton of a man, a spindle with the remains of a woman. In Germany, even at the present day, the jurists divide families into male and female by the titles of *swerdt-magen* and *spindel-magen*—in other words, sword-members and spindle-members. Among the ancient Franks, when a free woman formed an attachment to a slave, she was summoned before the elders of the tribe, who, in open council, offered her the choice of a sword or a spindle. If she accepted the former, she not only retained the freedom, which was her birthright, but also acquired supremacy over the serf with whose fortunes she had connected herself; on the contrary, if she chose the spindle, she reduced herself to the level of her lover.

The French law, by which 'No woman shall succeed in Salic land,' has been expressed in popular phraseology by the words, *le royaume de France ne tombe point en quenouille*—the kingdom of France never falls under the distaff. The well known *fleur de lis* is said to have been adopted as the regal cognizance of France, in allusion to the Salic code, and with reference to the passage of Scripture respecting the lilies of the field—'they toil not, neither do they spin.'

When the royal sepulchres of France, in the abbey of St Denis, were disgracefully desecrated at the period of the first revolution, several distaves and spindles, richly gilt, were found in the tombs of various queens. In Germany, it is still as customary to suspend a distaff and spindle over the tomb of a lady, as it is to place a sword and helmet over that of a knight. Pennant tells us that he saw a distaff, carved in stone, on the tomb of Alice, prioress of the nunnery of Emanuel, in Stirlingshire. The most remarkable instance of this kind in England is the tomb of Judge Pollard, of the Common Pleas, who died in 1540. On one side of the judge's tomb are the stone-carved effigies of his eleven stalwart sons, each girded with a sword; on the other, are represented his eleven fair daughters, each carrying a spindle. A curious story is related of the bustling housewife, the mother of those twenty and two children. When twenty only of them had been born, the lady, in commemoration of her large family, erected a magnificent painted window in her seat of Ninnet Bishop in Gloucestershire; and on this window she caused to be depicted herself and husband, with their ten sons and ten daughters. By some mistake, the artist left a blank space, which the lady ordered to be filled up by another son and daughter; and, as quaint old Fuller tells us, 'her expectancy came to pass in accordance.'

About the very time when matronly Dame Pollard was erecting her painted window, events of much greater importance were in progress. The spinning-wheel that worked with the foot was invented, and in course of introduction into England. Previous to this invention, spinning, though a most necessary art, was merely the occupation of female leisure; the employment of high and low, rich and poor, in the intervals of more important business, and during the long, tedious nights of winter. Fitzherbert, a writer on husbandry in the earlier part of Henry the VIII's reign, says: 'Let thy distaff be always ready for a pastime, that thou be not idle; undoubted a woman cannot get her living by spinning on a distaff, yet it stoppeth a gap, and yarn must needs be had.' But, through the more rapid production of yarn by the wheel, enabling a few to spin for many, spinning became a means of obtaining a livelihood, the higher classes had less necessity to practise it, and, consequently, the time-honoured appellation of *spinster* sank considerably in the social scale. That title, which in the primitive period of the distaff and spindle had been given to royal princesses, after the invention of the wheel, became legally applicable only to unmarried females under the rank of viscount's daughters. A somewhat similar change has been caused in our own time by the invention of the machine, and consequent extinction of the spinning-wheel. In Sir Richard Steele's *Spinster*, published in 1719, the daughters of wealthy farmers are among the spinners of linen and woollen, who petition against the use of the 'tawdry, pie-spotted, flabby, ragged, low-priced thing called calico; a foreigner by birth; made the Lord knows where, by a parcel of heathens and pagans that worship the devil, and work for a halfpenny a day.' Randle Holme, writing about the same time, describes three kinds of wheels then in use: the country, or farmer's wheel; the city, or gentlewoman's wheel; and the girdle wheel, which, being carried at the girdle, could be used when walking about. This last, Randle says, was 'a little wheel with gigam-bobs, pleasing to ladies that love not to overtoil themselves.' Indeed, down to the present century, the wheel was sedulously plied by ladies of slender income. There are not alive now, riding in their carriages, who were indebted for their first start in life to their mother's wheel. Many a college expense has it aided to defray, many an Indian outfit has it helped to purchase. But the wheel, emblem of 'variations and mutabilities,' as

Fluellen says, is subject to the very changes it so aptly symbolises. It is persons of much lower standing in the social scale who now wait in the halls of the giant Steam, to tend the whirling bobbins of the many-spindled mule and jenny.

The quantity of yarn produced by a good spinner from the wheel in a certain time depended principally upon its fineness. From *The Two Dogs*, we learn that a hank or twelve cuts was considered a fair day's work :

A country lassie at her wheel,
Her dizen done, she's unco weel.

But the spinners of Tyrone, who had the reputation of being the best in Ireland, thought two dozen no extraordinary task; and at their kemps, or contests of skill in spinning, they frequently produced as many as four dozen in one day. The native Irish—we use the term in contradistinction to the descendants of Scotch and English settlers—had songs specially composed and appropriated for singing at the wheel. Three of those 'spinning-wheel songs' are preserved in Bunting's *Ancient Music*; and the keen or funeral-cry of young Ryan, translated from Irish by the late Mr Croker, commences thus :

Maidens, sing no more in gladness
To your merry spinning-wheels;
Join the keener's voice of sadness,
Feel for what a mother feels.

The able authoress of *A Woman's Thoughts about Women*, in a late number (184) of this Journal, speaking of the needle, says it is 'a wonderful brightener and consolator; our weapon of defence against slothfulness, weariness, and sad thoughts; our thrifty helper in poverty; our pleasant friend at all times.' In the mediæval period, when men were women's tailors, the needle was little used by females, but the spindle and distaff, being their constant companions, afforded the same benefits and consolations to the sisterhood as the needle does now. Curiously enough, an old proverbial Latin verse, of the kind termed Leonine, actually alludes to this fact, though in other respects unjust to the sex :

Fallere, flere, nere, dedit Deus in muliere ;

which Chaucer thus translates in his prologue to the *Wife of Bath's Tale* :

Deceit, weeping, spinning, God hath give
To women kindly, while they may live.

Besides being the universal, and we may say natural symbols of the softer sex, and their unfulfilling source of profit and pastime, the spindle and distaff were also their legitimate offensive and defensive weapons. In the south of Europe, the keen-pointed steel spindle has often served as a stiletto; while in the north, the large distaff could readily be used as a club. 'We'll thwack him hence with distaves,' says Hermione in *The Winter's Tale*; again, in Beaumont and Fletcher's *King and no King*, a paltry fellow is spoken of as one 'so below a beating that the women find him not worthy of their distaves.' Goneril, in *King Lear*, alluding to the 'cowish terror' of her helpmate, says : 'I must change arms at home, and give the distaff into my husband's hands.' The wife of the immortal host of the Tabard, also, when she found her husband unwilling to resent her fancied injuries, exclaims :

I will have thy knife,
And thou shalt have my distaff, and go spin.

Chaucer, in another place, in the *Nonnes Prestes's Tale*, shews the use of the distaff on an emergency. When Dan Russell the fox, runs off with Chanticleer the cock, the widow and her daughters cry :

Harrow and well-a-way !
Ha, ha, the fox ! And after him they ran,
And eke with staves many another man ;
Ran Colley our dog, and Talbot and Garland,
And Malkin with her distaff in her hand.

One of the most curious of the early printed books, that are embellished with wood-cuts, is well known to connoisseurs as *The Shepherd's Calendar*. A chapter of this rare work is entitled, 'Of an Assault against a Snail.' The accompanying wood-cut represents a fortified palace. Upon one of the most accessible towers there is a snail, with head protruded and horns elevated, evidently in an attitude of defence. Two soldiers, fully equipped, and a woman, armed only with a distaff, form the assaulting-party against the snail-defended tower. In the letter-press, the snail defies his opponents, telling them that his strength and valour are fully commensurate with his terrific appearance, and concludes his braggadocio thus :

If that these armed men approach me near,
I shall them vanquish every one,
But they dare not for fear of me alone.

The snail has a correct opinion of his antagonists' courage. The soldiers, like the ancient Pistol, use 'brave words,' but that is all. Commencing their speech with the words, 'Horrible snail !' they threaten to eat him with pepper and salt, but end with the impotent conclusion of merely requesting their horned enemy to abandon the tower :

Get thee hence, by our advice,
Out of this place of so rich edifice,
We thee require, if it be thy will,
And let us have this tower that we come till.

The woman, however, exhibits more pluck than her male companions, soldiers though they be. Brandishing her distaff, she exclaims :

Go out of this place, thou right ugly beast,
Which of the vines the tender shoots doth eat.
Out of this place, or I shall thee sore beat
With my distaff, between the horns twain,
That it shall sound into the realm of Spain.

This 'assault against a snail' has been a grievous puzzle to antiquaries. Mr Ofor, in England, asks : 'What does it all mean ?' M. Nisard, in France, says that it is an insoluble enigma. The following nursery-rhyme, however, which we quote for the gratification of the curious, seems to sufficiently explain, at least to our own satisfaction, the mysterious affair :

Four-and-twenty tailors went to kill a snail,
The best man amongst them durst not touch her tail ;
She put out her horns like a great Kyloe cow—
Run, tailors, run, or she'll kill you all enow.

Nor has the rock, the modern representative of the distaff, been found less useful as an offensive weapon than its predecessor. An episode in domestic life, known in Scottish song as the *Weary Pound of Tow*, is much too natural to be wholly unfounded on fact :

I bought my wife a stone of lint,
As good as e'er did grow ;
And all that she has made of it
Is one poor pound of tow.
Quoth I : ' For shame, thou idle dame !
Go spin your top of tow.'
She took the rock, and with a knock,
She broke it o'er my pow.

When a French peasant wishes to designate the golden age of his country, the good old times as we often absurdly enough phrase it, he says it was in the days when Queen Bertha spun—*au temps que la reine Bertha filait*. This is generally understood to refer to a certain, or rather very uncertain, long-footed, or, according to some authorities, goose-footed Bertha, who figures in romantic legend as the mother of Charlemagne. But, allowing for difference of language, the same saying (*nel tempo ove Berta filava*), with exactly the same signification, is current in Italy. Who, then, was Bertha ? A clue to her real character is found in *The Gospels of Distaves* (*Les Evangiles des*

Queenouilles), one of those extraordinary old French works known as *joyousestes*, and which mingle Christianity with paganism, piety with obscenity, and sound sense with the absurdest superstition. One of the preachers, in this remarkable production, is a Dame Bertha of the Horn, who can be readily identified with the spinning Queen Bertha of French romance, on the one hand, and with a Frau Berta of German superstition, on the other. This Frau Berta, sometimes termed Fricke, still holds a conspicuous position in the folk-lore of Northern Germany. She visits the farmhouses and peasants' cottages during the twelve nights immediately succeeding Christmas. She inspects the condition of the spinning-wheels, and is particularly pleased to find all the flax spun off from the rocks. The maidens who are tidy and industrious spinners, she rewards with all kinds of good-luck; while she showers misfortunes on the lazy and the sluttish. And we have had her here, even in England, but in the character of a saint. Of the many miracles ascribed to St Bertha, we need only mention one. A convent founded by her was deficient of water, but, by merely drawing her distaff along the ground, she formed a noble aqueduct, copiously supplied with the pure liquid, for the use of the establishment. Her festival, termed St Distaff's Day, was kept on the morning after Twelfth-day, and Herrick thus alludes to it:

Partly work and partly play,
You must on St Distaff's Day.
If the maids a-spinning go,
Burn the flax, and fire the tow.

In short, Queen Bertha of the long-foot, and Dame Bertha of the Horn, Berta the fairy, and Bertha the saint, are all derived from one source, being the modern representatives of a much more ancient patroness of spinners, the Herthus or Frija of the Scandinavian mythology. It has been truly said that the religion of one era becomes the superstitions of the next. The three well-known stars in Orion's belt, which Scottish peasants term 'the ell-wand,' were known to the ancient Northmen as Frija's Distaff; but since the introduction of Christianity among them, those stars have been termed Mary's Rock.

The ramifications of popular superstitions are widely spread. One of the Roman rural laws forbade a woman to spin on the highway, it being considered an inauspicious omen to the travellers who might meet her so employed. Nearly two thousand years later, the very same notion was common in France. In the *Gospels of Distaves*, we read that it is exceedingly unlucky for a man travelling on horseback to pass a woman spinning; he should either put off his journey, or avoid her by turning back and going another way. In the Isle of Man, and also in Northern Germany, it was considered sinful to spin on Saturday; and the peasantry still relate a story of two old women, indefatigable spinners, who would spin on that day. At last one of them died; and while the survivor was spinning on the following Saturday, the deceased appeared to her, and holding out a dreadfully burned hand, said:

'Behold what I have justly won,
Because on Saturday I spun.'

In the Scottish cottage and farmhouse, the wheel was always carefully put away at an early hour of the Saturday afternoon; not from any superstitious feeling, but out of respect for the approaching day of rest. There was, however, a curious feeling connected with the reel in Scotland, no later than in the times of the grandmothers of many now living. The reel, registering the amount of yarn wound upon it, was looked upon as an approach to a magical contrivance, and with a conscientious feeling of avoiding the slightest

tampering with forbidden arts, numbers of Scottish matrons never used the 'winnle blades,' but measured their yarn by winding it over the left hand and elbow, repeating a certain formula to aid the memory in retaining the reckoning. The useful agricultural implement for winnowing corn, termed a fan, was long unused in Scotland for a similar reason. As another illustration of this feeling, we are induced to copy the following paragraph in full from the *Scots Magazine* of 1756. Without giving the whole, we would despair of affording the reader a correct idea of the curious affair:

'Peter Pairny, servant to Mr Thomas Muir, minister of the Seceding congregation at Orwell, who worked his wheel-plough, was lately accused before the session of using pranks something like enchantments, pretending to stop or render unfit for service a wheel-plough, by touching the beam with a rod, and bidding the plough stop till he should lose (loose) it. The session agreed to declare him under scandal, to debar him from sealing ordinances till the offence be purged; and to ordain him to appear and be publicly rebuked; at the same time leaving room for further inquiry into the matter, and for inflicting what further censure may be judged necessary. This sentence was intimated from his pulpit by Mr Muir on Sunday, September 12th, and the man appeared and was rebuked.'

If Pairny had lived a hundred years earlier, in all probability he would have been burned; if a hundred years later, he might have been honoured and feted as a benefactor of his race. But we are wandering from the thread of our discourse, and the length of our yarn warns us to cut it short, and reel up, without more than alluding to the numerous songs, anecdotes, proverbs, and homely tales connected with hand-spinning, an art, in most places, completely passed out of recollection; for the spinning-wheel, after superseding the distaff and spindle, was in its turn deposed by machinery worked by steam. Like the black-jack, the wheel of the turnspit dog, the pillion, and the pack-saddle, the spinning-wheel is now almost unknown, save as a relic of the past. As such, it may sometimes be found on the upper back-shelf of a museum or collection of antiquities. And when we take into consideration that a steam-engine will whirl 150,000 spindles at once, rattling off 80,000 miles of yarn in an hour, at an expense of less than a halfpenny for every six miles—that the thousands of women tending steam-spinning machines earn more in one day than they could have earned in a week by hand-spinning—we may, in spite of all the pleasing associations and recollections of the spinning-wheel, be very well contented to leave it on the shelf: its work is done—our yarn is spun.

OCEOLA:

A ROMANCE.

CHAPTER LXXII.—THE CONDITION OF BLACK JAKE.

WE had escaped from the block-house in boats, down the river to its mouth, and by sea to St Marks. Thence the volunteers scattered to their homes—their term of service having expired. They went as they listed; journeying alone, or in straggling squads of three and four together.

One of these groups consisted of old Hickman the hunter, a companion of like kidney, myself, and my ever-faithful henchman.

Jake was no longer the 'Black Jake' of yore. A sad change had come over his external aspect. His cheek-bones stood prominently out, while the cheeks themselves had fallen in; his eyeballs had retreated far within their sockets, and the neglected wool stood out over his temples in a thick frizzled shock. His skin had lost its fine ebony polish, and shewed

distinct traces of corrugation. Wherever 'scratched' by his now elongated finger-nails, a whitish dandruffy surface was exhibited.

The poor fellow had fared badly in the block-house; and three weeks of positive famine had played sad havoc with his outward man.

Starvation, however, but little affected his spirits. Throughout all, he had preserved his jovial mood, and his light humour often roused me from my despondency. While gnawing the corn cob, and washing down the dry maize with a gourd of cold water, he would indulge in rapturous visions of 'homin' and hog-meat,' to be devoured whenever it should please fate to let him return to the 'ole plantayshun.' Such delightful prospects of future enjoyment enabled him the better to endure the pinching present—for anticipation has its joys. Now that we were free, and actually heading homeward; now that his visions were certain soon to become realities, Jake's jovialty could no longer be kept within bounds; his tongue was constantly in motion; his mouth ever open with the double tier of 'ivories' displayed in a continuous smile; while his skin seemed to be rapidly recovering its dark oily lustre.

Jake was the soul of our party, as we trudged wearily along; and his gay jokes affected even the staid old hunters, at intervals eliciting from both loud peals of laughter.

For myself, I scarcely shared their mirth—only now and then, when the sallies of my follower proved irresistible. There was a gloom over my spirit, which I could not comprehend.

It should have been otherwise. I should have felt happy at the prospect of returning home—of once more beholding those who were dear—but it was not so.

It had been so on my first getting free from our block-house prison; but this was only the natural reaction, consequent upon escape from what appeared almost certain death. My joy had been short-lived: it was past and gone; and now that I was nearing my native home, dark shadows came over my soul; a presentiment was upon me that all was not well.

I could in no way account for this feeling. I had heard no evil tidings. In truth, I had heard of home or of friends for a period of two months. During our long siege, no communication had ever reached us; and at St Mark's, but slight news from the settlements of the savanee. We were returning in ignorance of what had transpired there during our absence—what might have transpired worthy of being known.

This ignorance itself might have produced uncertainty, doubt, even apprehension; but it was not the sole cause of my presentiment. Its origin was different. Perhaps the recollection of my abrupt departure—the unsettled state in which I had left the affairs of our family—the parting scene, now vividly recalled—remembrances of Ringgold—reflections upon the wicked designs of this wily villain—all these may have contributed to form the apprehensions under which I was suffering. Two months was a long period; many events could happen within two months, even in the narrow circle of one's own family. Long since it had been reported that I had perished at the hands of the Indian foe; I was believed to be dead, at home, wherever I was known; and the belief might have led to ill results. Was my sister still true to her word, so emphatically pronounced in that hour of parting? Was I returning home to find her still my loved sister? Still single and free? or had she yielded to maternal solicitation, and become the wife of the vile catiff after all?

With such conjectures occupying my thoughts, no wonder I was not in a mood for merriment. My

companions noticed my dejection, and, in their rude but kind way, rallied me as we rode along. They failed, however, to make me cheerful like themselves. I could not cast the load from my heart. Try as I would, the presentiment lay heavy upon me, that all was not well.

Alas, alas! the presentiment proved true—no, not true, but worse—worse than my worst apprehensions—worse even than that I had most feared.

The news that awaited me was not of marriage, but of death—the death of my mother—and worse than death—horrid doubt of my sister's fate. Before reaching home, a messenger met me—one who told an appalling tale.

The Indians had attacked the settlement, or rather my own plantation—for their foray had gone no further: my poor mother had fallen under their savage knives; my uncle too; and my sister? *She had been carried off!*

I stayed to hear no more; but, driving the spurs into my jaded horse, galloped forward like one suddenly smitten with madness.

CHAPTER LXXIII.

A SAD SPECTACLE.

My rate of speed soon brought me within the boundaries of the plantation; and, without pausing to breath my horse, I galloped on, taking the path that led most directly to the house. It was not the main road, but a wood-path here and there closed up with 'bars.' My horse was a spirited animal, and easily leaped over them.

I met a man coming from the direction of the house—a white man—a neighbour. He made motions as if to speak—no doubt, of the calamity. I did not stop to listen. I had heard enough. My eyes alone wanted satisfaction.

I knew every turn of the path. I knew the points where I should first come in sight of the house.

I reached it, and looked forward—Father of mercy! there was no house to be seen!

Half-bewildered, I reined up my horse. I strained my eyes over the landscape—in vain—no house.

Had I taken the wrong road, or was I looking in the wrong direction? No—no. There stood the giant tulip-tree, that marked the embouchure of the path. There stretched the savanna; beyond it the home-fields of indigo and maize; beyond these the dark wood-knoll of the hommock; but beyond this last there was nothing—nothing I could recognise.

The whole landscape appeared to have undergone a change. The gay white walls—the green *jalousies*—the cheerful aspect of home, that from that same spot had so often greeted me returning hungry and wearied from the hunt—were no longer to be seen. The sheds, the negro-cabins, the offices, even the palings had disappeared. From their steads I beheld thick volumes of smoke ascending to the sky, and rolling over the sun till his disc was red. The heavens were frowning upon me.

From what I had already learned, the spectacle was easy of comprehension. It caused no new emotion either of surprise or pain. I was not capable of suffering more.

Again putting my horse to his speed, I galloped across the fields towards the scene of desolation.

As I neared the spot, I could perceive the forms of men moving about through the smoke. There appeared to be fifty or a hundred of them. Their motions did not betoken excitement. Only a few were moving at all, and these with a leisurely gait, that told they were not in action. The rest stood in groups, in lounging attitudes, evidently mere spectators of the conflagration. They were making no attempt to extinguish the flames, which I now observed

mingling with the smoke. A few were rushing to and fro—most of them on horseback—apparently in the endeavour to catch some horses and cattle, that, having escaped from the burnt enclosure, were galloping over the fields neighing and lowing.

One might have fancied that the men around the fire were those who had caused it; and for a moment such an idea was in my mind. The messenger had said that the foray had just taken place—that very morning at daybreak. It was all I had heard, as I hurried away.

It was yet early—scarcely an hour after sunrise—for we had been travelling by night to avoid the hot hours. Were the savages still upon the ground? Were those men Indians? In the lurid light, amidst the smoke, chasing the cattle—as if with the intention of driving them off—the conjecture was probable enough.

But the report said they had gone away: how else could the details have been known?—the murder of my mother, the abduction of my poor sister? With the savages still upon the ground, how had these facts been ascertained?

Perhaps they had gone, and returned again to collect the booty, and fire the buildings? For an instant, such fancies were before my mind.

They had no influence in checking my speed. I never thought of tightening the rein—my bridle-arm was not free; with both hands I was grasping the ready rifle.

Vengeance had made me mad. Even had I been certain that the dark forms before me were those of the murderers, I was determined to dash forward into their midst, and perish upon the body of a savage.

I was not alone. The black was at my heels; and, close behind, I could hear the clattering hoofs of the hunters' horses.

We galloped up to the selvidge of the smoke. The deception was at an end. They were not Indians or enemies, but friends who stood around, and who hailed our approach neither with words nor shouts, but with the ominous silence of sympathy.

I pulled up by the fire, and dismounted from my horse: men gathered around me with looks of deep meaning. They were speechless—no one uttered a word. All saw that it was a tale that needed no telling.

I was myself the first to speak. In a voice so husky as scarcely to be heard, I inquired: 'Where?'

The interrogatory was understood—it was anticipated. One had already taken me by the hand, and was leading me gently around the fire. He said nothing, but pointed towards the hommock. Unresistingly I walked by his side.

As we neared the pond, I observed a larger group than any I had yet seen. They were standing in a ring, with their faces turned inward, and their eyes bent upon the earth. *I knew she was there.*

At our approach, the men looked up, and suddenly the ring opened—both sides mechanically drawing back. He who had my hand conducted me silently onward, till I stood in their midst. I looked upon the corpse of my mother.

Beside it was the dead body of my uncle, and beyond the bodies of several black men—faithful slaves, who had fallen in defence of their master and mistress.

My poor mother!—shot—stabbed—scalped. Even in death had she been defeated!

Though I had anticipated it, the spectacle shocked me.

My poor mother! Those glassy eyes would never smile upon me again—those pale lips would neither chide nor cheer me more.

I could control my emotions no longer. I burst into tears; and, falling upon the earth, flung my arms

around the corpse, and kissed the cold mute lips of her who had given me birth.

CHAPTER LXXIV.

TO THE TRAIL.

My grief was profound—even to misery. The remembrance of occasional moments of coldness on the part of my mother—the remembrance more especially of the last parting scene—rendered my anguish acute. Had we but parted in affection—in the friendly confidence of former years—my loss would have been easier to endure. But no; her last words to me were spoken in reproach—almost in anger—and it was the memory of those that now so keenly imbibed my thoughts. I would have given the world could she have heard but one word—to know how freely I forgave her.

My poor mother! all was forgiven. Her faults were few and venial. I remembered them not. Ambition was her only sin—among those of her station, almost universal—but I remembered it no more. I remembered only her many virtues—only that she was my mother. Never until that moment had I known how dearly I loved her.

It was no time to indulge in grief. Where was my sister?

I sprang to my feet, as I gave wild utterance to the interrogatory.

It was answered only by signs. Those around me pointed to the forest. I understood the signs—the savages had borne her away.

Up to this hour I had felt no hostility towards the red men; on the contrary, my sentiments had an opposite inclination. If not friendship for them, I had felt something akin to it. I was conscious of the many wrongs they had endured, and were now enduring at the hands of our people. I knew that in the end they would be conquered, and must submit. I had felt sympathy for their unfortunate condition.

It was gone. The sight of my murdered mother produced an instantaneous change in my feelings; and sympathy for the savage was supplanted by fierce hostility. Her blood called aloud for vengeance, and my heart was eager to obey the summons.

As I rose to my feet, I registered vows of revenge. I stood not alone. Old Hickman and his fellow-hunter were at my back, and fifty others joined their voices in a promise to aid me in the pursuit.

Black Jake was among the loudest who clamoured for retribution. He too had sustained his loss. Viola was nowhere to be found—she had been carried off with the other domestics. Some may have gone voluntarily, but all were absent—all who were not dead. The plantation and its people had no longer an existence. I was homeless as well as motherless.

There was no time to be wasted in idle sorrowing; immediate action was required, and determined upon. The people had come to the ground armed and ready, and a few minutes sufficed to prepare for the pursuit.

A fresh horse was procured for myself; others for the companions of my late journey; and after snatching a breakfast hastily prepared, we mounted, and struck off upon the trail of the savages.

It was easily followed, for the murderers had been mounted, and their horses' tracks betrayed them.

They had gone some distance up the river before crossing, and then swam their horses over to the Indian side. Without hesitation, we did the same.

The place I remembered well. I had crossed there before—two months before—while tracking the steed of Ogeola. It was the path that had been taken by the young chief. The coincidence produced upon me a certain impression; and not without pain did I observe it.

It led to reflection. There was time, as the trail

was in places less conspicuous, and the finding it delayed our advance. It led to inquiry.

Had any one seen the savages?—or noted to what band they belonged? Who was their leader?

Yes. All these questions were answered in the affirmative. Two men, lying concealed by the road, had seen the Indians passing away—had seen their captives, too; my sister—Viola—with other girls of the plantation. These were on horseback, each clasped in the arms of a savage. The blacks travelled afoot. They were not bound. They appeared to go willingly. The Indians were 'Redsticks'—led by *Oceola*.

Such was the belief of those around me, founded upon the report of the men who had lain in ambush.

It is difficult to describe the impression produced upon me. It was painful in the extreme. I endeavoured not to believe the report. I resolved not to give it credence, until I should have further confirmation of its truthfulness.

Oceola! O heavens! Surely he would not have done this deed? It could not have been he?

The men might have been mistaken. It was before daylight the savages had been seen. The darkness might have deceived them. Every feat performed by the Indians—every foray made—was put down to the credit of *Oceola*. *Oceola* was everywhere. Surely he had not been there?

Who were the two men—the witnesses? Not without surprise did I listen to the answer. They were *Spence and Williams!*

To my surprise, too, I now learned that they were among the party who followed me—volunteers to aid me in obtaining revenge for my wrongs!

Strange, I thought; but stranger still that *Arens Ringgold* was not there. He had been present at the scene of the conflagration; and, as I was told, among the loudest in his threats of vengeance. But he had returned home; at all events, he was not one of the band of pursuers.

I called *Spence and Williams*, and questioned them closely. They adhered to their statement. They admitted that it was dark when they had seen the Indians returning from the massacre. They could not tell for certain whether they were the warriors of the 'Redstick' tribe, or those of the 'Long Swamp.' They believed them to be the former. As to who was their leader, they had no doubt whatever. It was *Oceola* who led them. They knew him by the three ostrich feathers in his head-dress, which rendered him conspicuous among his followers.

These fellows spoke positively. What interest could they have in deceiving me? What could it matter to them, whether the chief of the murderous band was *Oceola*, *Coa Hajo*, or *Onopa* himself?

Their words produced conviction—combined with other circumstances, deep painful conviction. The murderer of my mother—he who had fired my home, and borne my sister into a cruel captivity—could be no other than *Oceola*.

All memory of our past friendship died upon the instant. My heart burned with hostility and hate, for him it had once so ardently admired.

CHAPTER LXXV.

THE ALARM.

There were other circumstances connected with the bloody affair, that upon reflection appeared peculiar and mysterious. By the sudden shock, my soul had been completely benighted; and these circumstances had escaped my notice. I merely believed that there had been an onslaught of the Indians, in which my mother had been massacred, and my sister borne away from her home—that the savages, not satisfied with blood, had added fire—that these outrages had

been perpetrated in revenge for past wrongs, endured at the hands of their pale-faced enemies—that the like had occurred elsewhere, and was almost daily occurring—why not on the banks of the *Suwanee*, as in other districts of the country? In fact, it had been rather a matter of wonder, that the settlement had been permitted to remain so long unmolested. Others—far more remote from the *Seminole* strongholds—had already suffered a like terrible visitation; and why should ours escape? The immunity had been remarked, and the inhabitants had become lulled by it into a false security.

The explanation given was that the main body of the Indians had been occupied elsewhere, watching the movements of *Scott's* triple army; and, as our settlement was strong, no small band had dared to come against it.

But *Scott* was now gone—his troops had retired within the forts—their summer quarters—for winter is the season of campaigning in *Florida*; and the Indians, to whom all seasons were alike, were now free to extend their marauding expeditions against the trans-border plantations.

This appeared the true explanation why an attack upon the settlement of the *Suwanee* had been so long deferred.

During the first burst of my grief, on receiving news of the calamity, I accepted it as such: I and mine had merely been the victims of a general vengeance.

But the moments of bewilderment soon passed; and the peculiar circumstances, to which I have alluded, began to make themselves apparent to my mind.

First of all, why was our plantation the only one that had been attacked?—our house the only one given to the flames?—our family the only one murdered?

These questions startled me: and natural it was that they did so. There were other plantations along the river equally unprotected—other families far more noted for their hostility to the *Seminole* race—nay, what was yet a greater mystery, the *Ringgold* plantation lay in the very path of the marauders; as their trail testified, they had passed around it to reach our house; and both *Arens Ringgold* and his father had long been notorious for bitter enmity to the red men, and violent aggressions against their rights.

Why, then, had the *Ringgold* plantation been suffered to remain unmolested, while ours was singled out for destruction? Were we the victims of a particular and special vengeance?

It must have been so; beyond doubt, it was so. After long reflection, I could arrive at no other conclusion. By this alone could the mystery be solved.

And *Powell*—oh! could it have been he?—my friend, a fiend guilty of such an atrocious deed? Was it probable? was it possible? No—neither.

Despite the testimony of the two men—vile wretches I knew them to be—despite what they had seen and said—my heart refused to believe it.

What motive could he have for such special murder?—ah! what motive?

True, my mother had been unkind to him—more than that, ungrateful; she had once treated him with scorn. I remembered it well—he, too, might remember it.

But surely he, the noble youth—to my mind, the *beau idéal* of heroism—would scarcely have harboured such petty spite, and for so long?—would scarcely have repayed it by an act of such bloody retribution? No—no—no.

Besides, would *Powell* have left untouched the dwelling of the *Ringolds*? of *Arens Ringgold*, one of his most hated foes—one of the four men he had

sworn to kill? This of itself was the most improbable circumstance connected with the whole affair.

Ringgold had been at home—might have been entrapped in his sleep—his black retainers would scarcely have resisted; at all events, they could have been overcome as easily as ours.

Why was *he* permitted to live? Why was *his* house not given to the flames?

Upon the supposition that Ogeola was the leader of the band, I could not comprehend why he should have left Arens Ringgold to live, while killing those who were scarcely his enemies.

New information, imparted to me as we advanced along the route, produced new reflections. I was told that the Indians had made a hasty departure—that they had, in fact, retreated. The conflagration had attracted a large body of citizen soldiery—a patrol upon its rounds—and the appearance of these, unexpected by the savages, had caused the latter to scamper off to the woods. But for this, it was conjectured other plantations would have suffered the fate of ours—perhaps that of Ringgold himself.

The tale was probable enough. The band of marauders was not large—we knew by their tracks there were not more than fifty of them—and this would account for their retreat on the appearance even of a smaller force. The people alleged that it was a retreat.

This information gave a different complexion to the affair—I was again driven to conjectures—again forced into suspicions of Ogeola.

Perhaps I but half understood his Indian nature; perhaps, after all, *he* was the monster who had struck the blow.

Once more I interrogated myself as to his motive—what motive?

Ha! my sister, Virginia—O God! could love—passion—

'The Indiyens! Indiyens! Indiyens!'

COUSIN ROBERT.

O Cousin Robert, far away
Among the lands of gold,
How many years since we two met?
You would not like it told.

O Cousin Robert, buried deep
Amid your bags of gold,
I dreamt of you but yesternight,
Just as you were of old.

You own whole leagues—I, half a rood
Behind my quiet door:
You have your lacs of gold rupees,
And I my children four.

Your tall barques dot the dangerous seas,
My 'ship's come home'—to rest
Safe anchored from the storms of life
Upon one faithful breast.

And it would cause nor start, nor sigh,
Nor thought of doubt or blame,
If I should teach our little son,
Our Cousin Robert's name.

That name—however wide it rings,
I oft think, when alone,
I rather would have seen it graved
Upon a church-yard stone—

Upon the white sunshiny stone
Where Cousin Alick lies;
Ah, sometimes, woe to him that lives!
And blessed he that dies!

O Cousin Robert, hot, hot tears,
Though not the tears of old,
Drop, thinking of your face last night,
Your hand's pathetic fold:

A young man's face—so like, so like
Our mothers' faces fair;
A young man's hand, so firm to hold,
So resolute to dare.

I thought you good—I wished you great;
You were my hope, my pride:
To know you good, to make you great,
I once had happy died;

To tear the plague-spot from that heart,
Place honour on that brow,
See old age come in crown'd peace,
I almost would die now;

Would give—all that's now mine to give,
To have you sitting there,
The Cousin Robert of my youth—
A beggar with gray hair.

O Robert, Robert, some that live
Are dead, long ere grown old:
Better the pure heart of our youth
Than palaces of gold.

Better the blind faith of our youth
Than doubt, which all truth braves:
Better to mourn—God's children dear,
Than laugh—the devil's slaves.

O Robert, Robert, life is sweet,
And love is countless gain,
Yet if I think of you, my heart
Is stabbed with sudden pain:

And as in peace this holy eve
I close our Christmas-doors,
And kiss good-night o'er sleeping heads—
Such bonny curls! like yours—

I fall upon my bended knees
With sobs that choke each word—
'On those who err and are deceived
Have mercy, O good LORD!'

THE INK OF THE ANCIENTS.

In a letter from Mr Joseph Ellis, of Brighton, addressed to the *Society of Arts' Journal*, he states that, by making a solution of shellac with borax, in water, and adding a suitable proportion of pure lamp-black, an ink is produced which is indestructible by time or by chemical agents, and which, on drying, will present a polished surface, as with the ink found on the Egyptian papyri. He made ink in the way described, and proved, if not its identity with that of ancient Egypt, yet the correctness of the formula which has been given him by the late Mr Charles Hatchett, F.R.S.

OUR LOST PET.

Tax beson d'aimer is perhaps one of the least mean of human weaknesses. Many are the troubles it causes to all of us, and yet we would fain not quite get rid of it, and are, on the whole, rather more respectable people with it than without it. For the unfortunate man to whom even his wife is only

A little better than his dog, a little dearer than his horse; for the forlorn old maid who, dying without heirs, endows her twelve parrots with enough to make the fortune of more than one poor family, it is at least a degree better to be fond of something, be it only a brute beast, than nothing. And many a brute beast is capable of being raised, by education, attention, and kindness, to an affectionate rationality which makes it quite as pleasant company, alas! as a great many human beings.

This is not meant to be an essay in defence of pets—often most intolerable nuisances to everybody but the possessor—pet dogs (perhaps the most unbearable), pet birds, fowls, rabbits, monkeys—and the long line of domesticated quadrupeds and bipeds, down to the featherless biped, the child-pet, or the charity-pet, whose lot is the most cruel-kind of any. I am only going to tell a very plain and simple story about a lost pet of ours, who cost us the usual amount of pain which all who are guilty of the afore-named human weakness must consent to endure.

We—that is, myself and the sharer in my loss—are not universally benevolent. We do not take to our bosoms every walking, hopping, and creeping thing. We are eclectic in our tastes, and though we hope we would treat civilly and kindly every creature alive, still, we have never had any particular interest in more than one sort of pets, and that is *cats*.

I hope the gentle reader will not here immediately lay down this paper in a mood of calm contempt; or if he has done so, may I respectfully request him to take it up again? I assure him that he shall meet with nothing insanely extravagant, or sentimentally maudlin; that his prejudices will be treated with deference, and himself regarded as a person who is simply mistaken—nothing more. He never could have had a pet cat.

We have had—many: the fact that a cat's nine lives do not equal one human being's, necessitating that plural. Otherwise, we would have kept faithful to this day unto our first favourite 'Muff'—fallen in with at the age of three—or his successor, our veritable first-love, Rose; Rose, the flower of cats, who

bloomed in our household for ten years. My heart softens as I recall her. Her memory is green still; and I may yet, for a newer generation, write a *Biography of our Rose*.

Since her day, we have both had several pets, *en passant*—confiding cats who followed us home through London streets, as they always have a trick of doing; eccentric cats who, changing their natures, would go shooting in the forests, 'point' the game, and bring it to the master with an unflinching faithfulness; sea-borne cats, cherished during half a voyage, and then missed—after which rumoured to have been seen floating away, helplessly mewing, for a quarter of a mile astern. Yet we never had but one pet who at all supplied the place of the never-forgotten Rose. Of him I am now about to tell.

He was the first-born of his mother, but in nowise like her—she being the ugliest, stupidest, and most untender of feline animals. Her very kittens she would carry into damp corners and under grates, and there forsake them, to be trodden to death or shovelled unwittingly on the back of the fire: nay, with some she is reported to have done as the New Zealand husband did with the wife whom he couldn't keep and was too fond of to part with—she is reported to have eaten them. Peace to her manes! Nothing in her life ever became her like the leaving of it.

But her son was quite a different character. His beauty was his least merit. In kittenhood he had such winning ways that he was continually asked to tea in the parlour; cradled in apron-pockets, gowns, and shirt-fronts; taught to walk on the table, and educated with a care and distinction which could not but make him the most gentlemanly of cats. And such he grew. There was a conscious 'fine-young-fellowism' in the very arch of his back, and curve of his handsome tail. His tail, we always said, was his weak point—a pardonable vanity. He seemed to take a conscious pride in it, as a fashionable Antinous might in his curls, his hands, or his whiskers. For his morals, they were as unexceptionable as his appearance. He was rarely heard to mew, even for his dinner; and as for theft, I remember the sublime indignation of his first friend and protector, the cook, when one day I suggested shutting the pantry-door: '*He steal!* He never would think of such a thing!'

Have I sufficiently indicated his mental and moral perfections? Add to these a social and affectionate disposition, remarkable even in parlour-educated cats, and a general suavity of manner which made him considerate to the dog, and patronisingly indifferent to the fowls—and what more need be said of him, except his name?

This cannot be revealed; such publicity might wound his delicate sensitiveness. In this article he must only be known as 'Lo.' No bad name either: there was once a Saint Lo, of knightly memory; so 'Lo' is well suited to designate the most chivalrous of cats.

He grew up to maturity in the house where he was born. For three years his familiar apple-tree, on which he tried his youthful claws, blossomed and bore; for three years, the sparrows in the thorn and willow provided him with a little useful recreation—no worse, certainly, than deer-stalking and hare-hunting; and then his destiny darkened. We were about to fit—a long fitting of some hundred miles and more; and of all the questions involved therein, one of the most difficult was, what was to be done with Lo? We could not leave him; we did not like to give him away; and yet we feared that the cry, 'A new home—who'll follow?' would never be responded to by him. The most frequent suggestion was to take his photograph, and then give him a little dose of the 'fixing' material, which would 'fix' both him and his likeness for ever in this world, and save all further trouble. But this idea was not likely to be carried out.

'When there's a will there's a way.' I made up my mind concerning him.

On the day of the fitting—when he was lying peacefully and unconsciously on his native kitchen hearth, which he was never more to behold—I carried him, purring and fondling, to an empty room upstairs, and locked him in, together with a hamper and dinner. He did not quite understand the proceeding, but accommodated himself to circumstances, and lay down to sleep in the sunshine. There, ignorant of the black future, he passed his day. At nightfall I packed him and sewed him up, still purring, in the hamper of his woes. To parody the old axiom: 'When a cat's carried, his sorrow begins.' From that hour there was no more peace for our unfortunate Lo.

He, with myself, was taken in for a week by a benevolent family, who kept a bird. This necessitated Lo's solitary confinement in a wash-house. Thither, almost exanimate from fright—I believe he even fainted in my arms—was he conveyed; and there, though visited, fed, and consoled with, he remained in a state of mind and body of indescribable wretchedness—sleeping in the copper, and at the least noise retiring for refuge up the chimney. His appearance, when being repacked for his second journey, was that of a disconsolate, half-idiotic sweep.

Through all the roar of London, on the top of cab or omnibus, was borne the luckless cat. What could he have thought of the great Babel? he who, among suburban gardens and fields, had passed his peaceful days. He never uttered a sound; not even when, finding no boy at hand, I took up his hamper myself, and carried it the length of a square, conversing with him meantime, till the sight of a passer-by turning round, reminded me that this might possibly convey to the public in general the impression of my being slightly insane. One pause he had in his miseries—one happy evening by a charitable kitchen hearth, and then he was, hamper and all, consigned to the parcel-van of the northern mail.

'Please take care of it—it's a cat.'

'A what, ma'am?' asked the magnificent-looking guard.

'A cat—a live cat.'

He laughed. 'O yes, ma'am—all right.' And so I bade poor Lo a temporary farewell.

Letters communicated his wellbeing. He had arrived at home—had recovered from his first paroxysms of terror—had even begun to wash himself and appear like a cat of civilised mien. There was

hope that I should find him sitting happily on the hearth, which, we are weak enough to fancy, never looks quite comfortable and home-like without a cat. But hope deceived. My first question: 'How is he?' was answered dolefully: 'He has run away.'

Ay, just when his troubles were ended, when his mistress was coming home, when all the delights of milk and cream, sunshiny lawns to sleep on, green trees to climb, mice, and—dare I say it?—young birds to eat, were opening before him—he ran away! We returned to a catless fireside.

Of course, every search was made: a reward offered, the village policeman applied to; but day after day passed, and no sight of Lo. Sometimes flying rumours reached us of his being seen in gardens, or scampering across fields, or sheltering in some stable or barn. Once, the policeman paid us a special visit, stating formally his knowledge of his whereabouts, and that every measure should be taken for his recovery; but even the professional skill, worthy of being exercised on some distinguished criminal, failed with regard to our cat. We had almost given him up for lost.

Now, one ought never patiently to submit to any loss, till every possible means tried have proved it irremediable. One evening after he had been a week missing, and taking into account his exceedingly shy and timid disposition, the strange country in which he had lost himself, and his utter ignorance of ill-usage, we began to relinquish all hope of his return, I resolved to go in search of the cat myself. A scheme about as wild as starting to hunt up a brother in Australia, or a friend in the far west—a sort of 'Evangeline' expedition: yet most women reading Longfellow's exquisite poem, must feel that such a proceeding as Evangeline's would be perfectly natural, reasonable, and probable under similar circumstances.

So, after tea, I went out. It was a lovely evening, with hedges just budding, and thrushes just beginning to pipe out that peculiar rich note which always reminds one of the return of spring—an evening when one enjoys, and likes to think of all those belonging to one as enjoying, the renewal of nature, life, and hope. I did not like to think of even my cat—my poor cat, for whom was no after-life, no immortal and eternal spring—dying in a ditch, or starved, beaten, ill-used, till death was the kindest thing I could hope for him. I almost wished I had taken his friend's advice, that we had photographed him, and 'fixed' him, safe from all mortal care.

At the nearest house, where he had once been seen, I had inquired the day before. Both the civil husband and pleasant-looking wife knew quite well 'the lady who had lost her cat': they sympathised; and I felt sure that if he appeared again he would be coaxed, caught, and brought safe home. I then continued my pilgrimage.

Door after door did I attack with the stereotyped inquiry: 'Have you seen a strange cat? I have lost my pet cat, which I brought all the way from London; he is a great beauty, gray, with a particularly fine tail. I will give five shillings to anybody who brings him back; my name and address are so and so.'

This brief and simple formula was repeated, with slight *ad libitum* variations, from house to house within a mile. Once I ventured to address a milk-woman, with no result; she was a stranger: and once a little boy, playing about the road, whom I afterwards heard commenting to a friend in this wise: 'I say, Jack, that lady's hunting after a strange cat. He, he, but I wouldn't hunt after a strange cat—would you?'

Equally unsympathetic was an elderly gentleman, the owner of a beautiful house, garden, and conservatory, and who came most politely to the door, his bonnie little grand-daughter holding by his hand. He had a fine face, long silvery hair, was bland and

amiable of demeanour, reminding me of Mr Dickens's 'Casby the Patriarch.'

'Madam,' said he, after hearing my tale, 'if those animals are allowed to inhabit such a place, I devoutly wish all the cats in this world were in paradise. They are the ruin of us horticulturists. Do not regret yours. I can supply you out of my garden with any number, dead or alive.'

I explained that mine was an individual pet.

'Then, madam, could you not place your affections upon pets more worthy?' and he stroked the little girl's pretty flaxen hair. 'I am sorry to wound your feelings; but there have been—and I should rather regret their leaving—some Birmingham people in this neighbourhood who make a trade of catching and skinning—cats.'

I turned away, yet could hardly forbear a smile; the eccentric, but, I firmly believe, well-meaning old gentleman, received my adieus, and bowed me to the very gate.

Many another house I tried; my search having one result—namely, the discovery that I had a number of nice neighbours—old ladies, neat as a new pin; spruce parlour-maids; kindly mistresses, mostly with babies—such an abundance of civil tongues, and pleasant, good-natured, nay, handsome faces, as might well be satisfactory to a new-comer into this country place. I also gained one consolation, that it was the safest neighbourhood in which Lo could possibly have been lost, since all the good folk seemed personally acquainted, not only with one another, but with one another's cats. Ours might yet turn up, or, if not, might find an asylum in the bosom of some unknown family, who would console him for the cruel mistress and uncomprehended miseries which doubtless had unsettled his reason, and driven him to despairing flight.

So, having done all that could be done, I was fain to turn homeward—

In the spring twilight, in the coloured twilight,

—never seen except in spring. It tinted the bare trees and brown hedges, throwing over the whole sky a tender light, and changing the shiny bit of far-away western sea into a lake of burning roses. Wonderful was the peace over all animate and inanimate nature, as it lay, waiting in faith the step-by-step advance of another unknown year.

Passing the lodge of the big house of the village—an open door, fire-light, and children's prattle, inspired me with one last vague hope. I knocked.

'Have you seen,' &c., &c., &c., as usual.

No. Yet the sight disclosed almost atoned for the disappointment. An interior, such as only an English cottage could furnish; a cottager's wife, such as Morland or Gainsborough would have delighted to immortalise. Her face, healthy, fair, and sweet—nay, downright beautiful, was reflected feature by feature in two other little faces—one staring out bravely from beside mother, the other half-hidden in her gown. This last charming little face, which no persuasions could allure from its shelter, was itself worth the whole evening's pilgrimage to look at; and the centre picture, half twilight, half fire-light, is a thing to be set down in memory, among passing glimpses of unutterably beautiful fragments, which remain dagger-retyped as such, for ever.

This episode, with the rest, amused us for some time, when, coming home, we talked over our chances of recovering our lost pet; conjecturing that for a month to come, we should have all the stray cats of the neighbourhood brought to us for recognition—except the right one. But to 'greet ower spilt milk' is not our custom, lest life should become not only a *via lactea*, but a *via lachrymosa*. So, having done our best, we dismissed the subject.

Next day, sitting at work, I heard a scuffle in the hall; the door was flung joyfully open—

'Ma'am, there's your cat.'

It was indeed. Gaunt, scared, dirty; fierce with hunger, and half-wild with fright, the poor runaway was brought home to his mistress's arms.

After the immemorial fashion, I drop a veil over the pathetic scene which followed.

He now lies fast asleep at my feet. He has made a clean breast of it—that is to say, he has resumed his usual costume of white shirt-front and white stockings, which contributes so largely to his gentlemanly appearance. He has also gradually lost his scared look, and is coming into his right mind. A few minutes since, he was walking over my desk, arching his poor thin back in the ancient fashion, and sweeping my face with his sadly diminished but still inimitable tail; putting his paws on my shoulders, and making frantic efforts at an affectionate salutation—had I not a trifling objection to that ceremony.

Surely, after all this bitter experience, he will recognise his truest friends—true even in their unkindness; will believe in his new quarters as home, and play the prodigal no more.

Poor Lo! I hope it is not applying profanely 'the noblest sentiments of the human heart,' if, as he lies there, snugly and safely, I involuntarily hum to myself a verse out of *The Clerk's Two Sons of Owsenford*:

The hallow days o' Yule were come,
And the nights were lang and mirk,
When in there cam her ain twa sons,
Wi' their hats made o' the birk.

Blaw up the fire now, maidens mine,
Bring water frae the well:
For a' my house sall feast this nicht,
Since my twa sons are well.

And she has gane and made their bed,
She's made it saft and fine,
And she's happit them in her gay mantil,
Because they were her ain.

(Bless us, what would 'Mr Casby' say?)

I here end my story. Better—since fortune is fickle, and affection often vain—end it now; lest, as Madame Cottin says in the final sentence of her *Exiles of Siberia*—'did I continue this history, I might have to chronicle a new misfortune.'

THE TRAINING OF BEASTS IN ANCIENT ROME.*

THE art of taming and training wild beasts was never practised on a grander scale than during the latter period of Roman antiquity. Very justly has Goethe represented 'delight in the wonderful, the incredible, and the monstrous,' as the most striking peculiarity of the later Romans. In fact, it may be said, that among these degenerate descendants of the world-conquerors, throughout a constant succession of the most powerful excitements, so effeminate a relaxation had crept in, that only one thing could give them interest—namely, the accomplishment of the impossible. Theatres that turned round upon pivots with all the audience, buildings in the sea, dishes composed of rarities from all quarters of the globe, are some of the fruits of this tendency, which ignored the limits of space and time, and regarded the laws of nature with scorn.

It was not enough that the rarest, fiercest, and most beautiful beasts were gathered together in Rome from the ends of the earth, they were also compelled

* Translated from the German.

to lay aside their instinctive impulses, and be obedient to what was most repugnant to their nature. The art of taming wild beasts was, at first, connected with the exhibitions of the amphitheatre and the circus; but to avoid wearying the public by successive repetitions of bloody contests between men and animals, recourse was had to games in which naturally tame beasts were exhibited along with others that had been tamed by art. In consequence of the great number of amphitheatrical displays, the labour of taming and training gave employment to multitudes of men. In an astrological poem of the early imperial date, where the constellations which predestine men to their several callings are given, there is found the horoscope of those who 'tame the tiger, soften the rage of the lion, converse with elephants, and render these unwieldy masses fit for human arts and duties.' In another poem of the fourth century of our era, the horoscope is represented of those who 'make bears, bulls, and lions fit for intercourse with men.' The whole imperial era, in fact, seems to have abounded in these tamers (*mansuetarii*).

Pliny observes that the smallest and most timid of beasts and birds, such as the swallow and the mouse, were altogether intractable; while the largest and fiercest, as the elephant and lion, were easy to tame. The ancient Indians had already very successfully tutored the elephant; but in Rome the discipline was carried to a much greater length. We quote Pliny's own words: 'In a play given by Germanicus, the elephants brought their clumsy evolutions into the shape of a dance. Sometimes they used to brandish their weapons in the air, to fight one another like gladiators, and to riot in a wanton dance. Later, they practised on the rope, on which four of them carried another in a litter, which was supposed to represent a woman in childbed, and whom they let down so gently upon the sofas of a guest-table, that they disturbed none of its occupants. It is told of an elephant that was slow at learning, and which had often been beaten on that account, that it was watched in the night, and found practising its lesson by itself. These huge animals mounted the tight-ropes with the greatest agility, and, what is even more remarkable, descended them with equal ease. Mucianus mentions an elephant that had learned to write Greek, and to its performances used to add: "I have written this with my own hand," &c.'

The taming of lions, also, had already been prosecuted to a great extent in ancient Greece and in Africa. The Indian lion, according to the Greek naturalist, was particularly easy to train when young. The Carthaginian Hanno is said to have been the first who went about attended by a tamed lion. Berenice, the Egyptian queen, had a favourite lion that ate at her table and used to lick her cheeks. Marc Antony rode about Rome in a chariot in which two lions were yoked. Domitian had a lion that was taught to carry the game in hunting, who let himself be chased by hares, and into whose throat one might thrust his hand with impunity. This prodigy was the subject of several poems. Martial counsels the hare to take refuge from the pursuit of the hounds in the jaws of the lion, and asks which was the greater miracle, that the eagle of Jupiter had not hurt Ganymede, or that the emperor's lion had not injured the imprisoned hare? This wonderful lion, however, was torn in pieces by another beast that broke out from its cage in the arena; but he had the consolation, as Statius says, of being mourned by both the people and the senate, and that the emperor took his loss worse than that of ever so many Egyptian, African, or German beasts. Heliogabalus used sometimes, for a joke, to terrify his guests by bringing his tame lions suddenly into the dining-room. Even tigers were sometimes so far

subdued as to lick their keepers' hands and faces. Leopards were easily reduced to submit to the rein of the charioteer.

Another triumph of this training was the inuring of land-animals to the water. Among the splendid exhibitions to which Titus owed no small amount of his popularity, was the arena under water, where horses, oxen, and other animals were collected, and taught to go through the duties to which they were accustomed on the dry land. The story of oxen being in the habit of carrying women, may probably have suggested the mode in which the abduction of Europa was accomplished. Oxen in general were very tractable; they learned to stand upon their hind-feet, and would allow jongleurs to perform their tricks on their backs, and were even skilled in playing the part of drivers in chariots at full speed.

Tamed beasts frequently served both to raise the splendour of mythological tableaux and ballets, and to enhance the comic displays at masquerades. Carnivals of the same kind were often held at the festivals of the gods. Apuleius describes a procession at a festival of Isis: there was a tame she-bear clothed as a woman, borne on a chair; an ape, in the costume of Ganymede, with a Phrygian cap and saffron-coloured mantle, presented a golden cup; an infirm old man, travelling with a winged ass, parodied Bellerophon with Pegasus. It may be supposed that, in such parodied representations, apes were the best adapted, and the favourites; and several monuments indicate this to have been the case. In these, apes are represented as being trained, sometimes under fear of the whip, at others by caresses; some with the head-gear and castanets of dancers, or in the long robe of the *citharædi* with the lyre, or as flute-blowers, or driving chariots with whip and reins, or as soldiers, &c., are mentioned by historians, and are to be seen in pictures. The most interesting of these is a wall-painting in Pompeii, where the deliverance of Anchises and Ascanius from the burning of Troy by *Æneas*, is represented by apes. These works, fortunately preserved, prove that the ape-comedy was zealously cultivated in ancient Rome. Also, as domestic animals, trained apes were in great request, especially for the amusement of children: an ape of clay has been found in a child's grave, evidently a plaything.

The comedy of the dogs flourished no less than that of the apes. We have the description of a play in which a dog acted the chief part, which was performed with great applause in the presence of the Emperor Vespasian, in the theatre of Marcellus at Rome. The four-footed actor shewed the greatest self-possession, when, in the course of the representation, some drink was given to him which purported to be poison, but which was really only a sleeping-draught. 'After he had swallowed the draught,' says the narrator, 'he began to tremble, to reel, and to become unconscious; at length he stretched himself out, as if dying, lay as really dead, and allowed himself to be pulled and dragged about at the plot of the drama required. But as soon as the signal was given, he began to move gently, as though awaking out of a deep sleep, lifted his head, and looked round him; and while the spectators were expressing their admiration, he went up to the person to whom, according to the fiction of the play, he belonged, and shewed so much delight and fondness by wagging his tail, as to excite universal astonishment.'

The boudoirs of fashionable Roman ladies were, as is well known, furnished with tame birds. Who does not remember the sparrow of Lesbia, which Catullus has made immortal?

How much tame doves were in request may be judged of by the fact, that towards the close of the republic, a celebrated breeder sold a single pair for

400 denarii, or about £14. Still higher prices were paid for speaking and singing birds; of the latter, the nightingale deservedly fetched the highest price. Pliny says they cost as much as slaves, and even more than armour-bearers in old times.

Music was played near the nightingales that were under training, which they used to answer and imitate. Of the talking birds, the parrot naturally held the highest place. The ancients maintained that the head of this bird was unusually hard; on which account he had to be beaten thereon with an iron rod, when he was under instruction, else he would not feel his chastisement. Next to beating, starving was the best mode of enforcing obedience. It is without doubt not owing to mere chance that speaking-parrots are scarcely ever mentioned by writers and poets of the imperial era without the observation that they had learned to salute the emperor with the 'Ave, Cæsar.' Probably it was dangerous, if a bird, which could speak at all, was not able to bear witness to the loyal disposition of its owner; at any rate, sins of omission of that kind led to accusations and trials at law. Two elegies on the deaths of parrots have come down to us; one by Statius upon the death of his friend Melior's favourite bird, which was so domesticated that it used to hop about at table among his guests, and eat out of their hands. Its cage was made of splendid tortoise-shell, the bars were silver and ivory, and the doors also of silver. The remaining elegy by Ovid is on the parrot of his Corinna, and is a very feeble and servile imitation of Catullus's poem on Lesbia's sparrow.

'Less famous than the parrot,' says Pliny, 'is the magpie, because it does not come from so great a distance: it speaks, however, much more distinctly. These birds get used to the words they are taught, and not only retain them, but become very fond of them, and frequently practise them by themselves. It is a fact that magpies have died in the vain attempt to utter a hard word. If the same word be not often repeated to them, it slips their memory; they then strive to recall it, and exhibit remarkable delight as soon as they hear it again.'

A story of a remarkable magpie is told in Plutarch's treatise on the cleverness of animals. A barber in Rome had a bird which not only imitated human speech, but also the noises of beasts and the tones of instruments, all spontaneously. One day, a great funeral procession happened to pass the barber's shop, and stopped immediately against it, upon which the accompanying trumpeters blew a long tune on their instruments. From this moment the magpie became dumb, and uttered no cry even to make its wants known. The whole neighbourhood became excited, and various surmises were circulated on the occurrence; some said the bird had been robbed of his voice by witchcraft, while the more knowing ascribed the calamity to a sudden deafness produced by the blowing of the trumpets. After a time, however, he recovered his voice, but did not exercise it in his former tricks, but sang the whole trumpet-piece from beginning to end. From this it was evident that his former silence arose from the pains he took to learn the melody.

The Empress Agrippina, who was a great fancier of birds, had a thrush which could imitate the human voice: the first instance of the kind, according to Pliny. Pliny adds, that at the time of his writing, the imperial princes had a starling which could speak Greek and Latin words; nightingales also which had learned the same, added daily to their knowledge, and could even speak good long sentences. These were taught in a separate room, where they heard no other sound than the voice of the trainer, who was constantly repeating the same words to them, and rewarded their proficiency with some favourite delicacy.

It is well known, also, that there were speaking-ravens, as this bird, in consequence of his human speech, had in the remotest antiquity acquired the honour of being regarded as the envoy of the god Apollo. In the time of Tiberius, there was a raven's nest on the temple of Castor, and from this a young raven flew into a neighbouring shoe-shop, the owner of which received him kindly, and taught him to speak. After a time, he used every morning to fly to the forum, to accost and greet Tiberius, and after him Germanicus and Drusus, and then the whole Roman people, after which he would fly back to the shop. This he continued to do for several years, and excited the admiration of all Rome. The owner of a neighbouring shop, through envy, killed the bird, which so roused the fury of the people, that the murderer was obliged to leave his quarters, and was afterwards put to death. The raven was buried with the most solemn pomp. Two Moors carried him on a bier; a flute-player went at the head of the procession; crowns in abundance decorated the body; and thus was he borne to a cemetery in the Appian Way, where he was burned and buried. This took place on the 27th of March A.D. 35. Pliny also knew a Roman knight who possessed a remarkably black crow from Spain which spoke several words very distinctly.

Besides the birds that were trained to speak, but little mention is made of others that distinguished themselves by their docility and cleverness. Pliny mentions only that goldfinches learn to execute with their feet and bill what they were ordered; and that tamed cranes were very amusing, and went through a kind of dance. In the plays of Titus, cranes were exhibited which fought each other.

Fishes in basins used, at the sound of a bell or rattle, to come to the edge to receive food from their owners' hands, a sight very often seen at the mansions of distinguished Romans: it is even maintained that some fishes recognised the names that were given them.

In these accounts, there may no doubt be something due to the score of exaggeration and embellishment, but by far the greater part rests on the evidence of unimpeachable eye-witnesses. If it be further remembered that we have only isolated and chance-preserved communications on the subject, we shall be led to confess that the beast-training of to-day cannot even remotely be compared with that of ancient times.

INGLEBOROUGH WITHIN.

Old Ingleborough, the Saxon Hill of Fire, is very rightfully one of the chief glories of Yorkshire.

Penyghent, Pendle, and Ingleborough,
Are the highest hills the country thorough,

is an ancient proverb of that boastful county; and considering that the Cumberland and Westmoreland mountains, half as high again, are within sight of all the three, it is a very creditable one. *Magna est veritas* is a quotation almost run to death, so true is it, but the thing which is popularly known as 'a whopper,' is sometimes more tremendous still. Ingleborough is, as its inhabitants would say, at the tail-end of the great northern hill-district, and, although not such a fine fellow as his betters, holds his head well above the flat country, like a country-gentleman of consideration who has, at least, married into the peerage. It is naturally divided into 'pastures' by terraces or scars of limestone, which give to the whole hill the appearance of being fortified by a power even greater and more ancient than that of the Roman. He had his camp upon Ingleborough, we may be pretty sure, and dropped his money about

— principally fourpenny-bits of the Constantine period—his brooches, his pottery, and his own bones, all over that neighbourhood, with his accustomed profusion. The Druids were there, of course, giving that artificial ringworm to the crowns of the hill, which it was their duty and pleasure to effect upon all waste places. It had a beacon also, which can still be seen, and has often given warning to canny Yorkshire when canny Scotland was about to make a flurry. There is a good deal of contention between these neighbours still, but after quite another sort of fashion, and diamond cuts diamond, instead of claymore broadsword. The northern folks arrive now quietly enough by the London and North-western Railway, and Bradshaw gives token of their approach instead of the beacon of old Ingleborough. But there is a grand look-out yet from the place where its ruins lie, two or three thousand feet above you waste of waters: Lancaster tower and town; the little caravans crossing the perilous sand-roads, which, in a few hours, the sea will again claim for her own; smoke-pennoned steamer and white-sailed ship; curved bays, with little fishing-hamlets; belts of woodland with a glimmering star, vast—and very properly so—of some ivy-mantled village church; the mouths of three fair rivers, running down with many a curve and sweep from awarded uplands; on this side, a sandbank or an island low in the sea, and on that, a group of mountains, the highest which our England has to boast of.

But, after all, our business is with Ingleborough Within. The whole district of Craven—the British Crayven, country of rocks—of which this hill is lord, is honeycombed by innumerable earth-chambers. Ribblesdale, Wenningdale, Wharfedale, and half a score of other dales, named after their respective rivers, which curve so shallowly and broadly around the wooded limestone cliffs, are undermined and tunnelled for miles by the hand of nature, and beneath them flow 'sunless streams,' like Alph, the sacred river, none knows whither, and 'measureless to man.' Often as we wander over the shoulders of Ingleborough, we hear voices and gurglings from torrents which never find their way at all to the upper world, and from out one cavernous mouth in the hill Wharfedale, flows a stream which, in flood-time, washes out periodically old silver coins of the reign of Edward I, from who-knows-whose deep-hidden treasury. In Giggleswick Scar, whose name unhappily does not convey any idea of their real grandeur, is an ebbing and flowing well, of exceedingly irregular habits, having a flux and reflux, with a difference of from a few inches up to a foot and a half, caused by some wondrous subterranean power, which miserable mathematicians explain by the principle of the double syphon. If you lay your ear to the ground at a certain spot in Ribblesdale, you will hear how the water comes down at Lowdons in fairyland, although not so much as a rivalet is to be seen outside of Robin Hood's Mill. Sometimes tremendous fannels, of two hundred feet in depth, lead by a very direct route, and one which would take no time at all to traverse, right down upon these mysterious streams, which are lit by them here and there, upon their dark road, as a tunnel by its shafts. Black and deep enough the water seems, as we peer over the edge of the 'pot' to look at it, nor does it make us at all ambitious to imitate that subterranean explorer, Sinbad, in trespassing on kelpie ground. Hellen Pot, which contains in it an underground water-fall of no less than forty feet, has been descended to the depth of three hundred and thirty feet, where the black river sinks into a quiet rotatory pool, and does not resurface to mortal eye for more than a mile. Some few of these pots have fish in them: large dark trout abound in Harle Pot, where 'the boggart,' in

rainy weather, is heard to threaten and fret, and can also found in less quantity in the chann above it, though the upward force of the water is then as strong as to cast up stones of considerable size to the surface, and even on the bank.

There is a village under Ingleborough called Clapham, a great deal more picturesque than its metropolitan namesake; and from it the ascent of the hill is generally begun. At the neighbouring railway-station are to be read considerable puff about his serene highness, and particularly concerning the structure of his internal arrangements, which cannot but be gratifying to any mountain. The tourist is entreated to come early, and to spend a week in visiting Ingleborough and its caves.

A quarter of an hour's walking brings us to the hamlet, with its verdurous ravine and the fall issuing from the artificial lake above it; and half an hour afterwards, we arrive by a beautiful path which winds through larch-plantations, round the mountain's side, at the mouth of the cave. The entrance is wild and imposing, embowered in trees, and overhung with trailing foliage, and commands such a view of the deep ravine beneath it, and of the limestone shoulder of opposite Ingleborough, bare or half draped in green, as would be fit enough to gladden the eye of an anchorite, did any chance to dwell here. When the tallow candles are lit, and the iron gates closed and locked upon us, we begin to wish ourselves outside again; and when we have stumbled over the sixty yards or so of rock-passage, which is the entire length of the old cave, and admired the few gloomy perforations which gleam about in the dark vault as cheerfully as mouldy coffin-plates, we feel quite over that we have had enough of caverns. That, at least, was our experience of Clapham Cave a score of years ago.

Up to that time, notwithstanding railway, and what is called the march of intellect, and in spite of all the newspapers had written against them, the water-fairies still dwelt under Ingleborough in the beautiful palace they had inhabited ages before the Hongist Brothers were a firm, or Agricola was a husbandman, or even a child in arms. They knew, because they could hear us talking where their secret wall was thinnest next to the old cave, that foolish mortals paid a shilling apiece for looking at what had once been a cattle-stable of their own; but between it and them a partition had been built up some two or three thousand years before, of 'calcareous concretion' upon our side, and of fretted rock upon theirs; so that they feared no intrusion. Their manners were similar to those prevailing in European courts. The king spent a great deal of time in racing, and worse; the queen, good old creature, up-born, and was content with eating bread and honey in her parlour, or, as is more likely in the house-keeper's room, out of the way, for her simple tastes were much reflected upon and ridiculed by her disrespectful children. The young prince had his bee-companions, and loved his rubber at skittles; and the princess, his sister, amused herself with her organ—for she was very high-church—or reclined upon frosted silver cushions, while her maidens (who, poor things, were kept standing all the time half out of the water) regaled her with stories of fabulous woman martyrs, till they brought quite a dryness into her eyes.

The palace itself was of extraordinary extent and splendour; the apartments, though many of them were very lofty, being indeed used in some instances as air-baths, never needed any support for their roofs, but the architect had built up a crystal pillar or two, here and there, for ornament, and in order to swell his bill, which, after all, he had great difficulty in getting settled by the late king (1240 A.D.)

never paid anybody except in his own I O U's, which were a sort of bank-note without the water-mark.

A statue was, however, erected to him by an admiring public in the Stalactite Gallery, where it is still standing; and as far as we can judge of a statue in the absence of the head and shoulders, a most excellent likeness.

It was in this very gallery that the princess was sitting with her attendants, modelling a little Gothic church out of crystallised sugar, when the catastrophe occurred that drove all the fairy family out of their ancestral halls. The king was in his counting-house—which, to say truth, was little better than a betting-office—counting out the money which he had won at a late spring-meeting; the queen was in her parlour, partaking of her usual refreshment; the prince was in the skittle-alley, knocking the pins about; when—'by the holy St Hookem,' exclaimed the princess, who was caught by the jaws, 'if the air isn't coming in, and the water running out!' The princess was not often right when she was positive, but this time she spoke like a book. A servant of the gentleman who owns the ground had been pecking in the old cave at the 'calcareous concretion' with a pickaxe, until he had pecked a hole in it!

Into what dismay and terror the royal household was thrown by this catastrophe, we can imagine, from the awful sounds which were heard from within at the time of the accident, but we shall not describe. We would rather be accurate than ever so poetical, and we confine ourselves only to those matters of which we have a certain knowledge. We ourselves did not enter the palace until long after its inhabitants had left it, but not a thing has been removed from the place where it was found at the period of their flight. Immediately upon setting foot upon the fairy side of the old cave, we find ourselves in the Stalactite Gallery. There lie the frosted silver cushions, with their pillows and footstools of the same material, and having—as it seems to us—the very impression which the princess must have left upon them when she swam away with her maidens through what little water remained. There stands the glittering little Gothic structure, only wanting the porch to complete it, and with a steeple of delicate spar which needs no peal of bells, inasmuch as itself returns, to the slightest touch, the sweetest bell-music imaginable. On the left hand, a little further on, are proofs of the housewifely care of the good queen, in fleeces of silvery wool and the ebony spoke of a spinning-wheel; a turkey's head is all that remains of her well-ordered larder; but her favourite bee-hive of frosted silver lies on its stalactite shelf, and her dark rich honey-combs are ranged beneath it. Beyond is the little counting-house, with a watery abyss close by, into which the sporting monarch leant upon the very first alarm, leaving in his haste his jockey-cap, also of frosted silver, upon the brink of it, where it now stands. A passage leads off, through water, to the left, as yet untrudged by mortal foot, up which the princess must have fled, for we can swear to her crystal slipper dropped at the entrance. Presently, we come to a water-fall, up which, when they were young, many a generation of the water-fairy family must have loved to leap, with that torso of the old bankrupt king beside it of which we have already spoken. Here, too, are crystal pillars separated in the centre, but still standing, the one half rising up from the marble floor to meet the other, depending from the vaulted ceiling—stalagmite and stalactite—which proves what little real necessity there was for their being erected. Besides these, crystallised air-plants—as they seem—hang everywhere from the roof, to which they are attached by a number of delicate silver icicles, which, when lighted up, have the prettiest and most magical effect.

And now we mortals have to stoop painfully for some distance along a depressed passage, where the original inhabitants had, doubtless, no sort of difficulty in gliding, and by the side of the stream which still traverses the palace from end to end, at this time shallow enough, except in particular spots, and many feet below the marble water-line which marks upon the walls what its depth has been wont to be; a solemn, melancholy sound it ever makes, 'low on the sand, and loud on the stone,' as though it bewailed its banished indwellers.

At last, and two hundred and sixty feet from the old cave, we arrive at the Gothic hall, of enormous length, and with groined and lofty ceiling. At one end of it is the splendid throne of the queen-mother, glittering with diamonds, with an unexplored vista on the right, up which, it is probable, she escaped with her household goods; in the right centre is the magnificent organ, formed of thin plates of silver spar, whose notes, awakened even by a mortal hand, are still most ravishing; in the left, and opposite—where he built it, perhaps, for the purpose of annoying his sister at her anthems—is the prince's skittle-alley, dry, and with three of the pins still standing. On both sides of the hall are various chambers filled with gleaming spar, transparent, and tapering perpendicularly from the summit, or branching into shrubberies of coral-work. From above depend numbers of sparkling chandeliers of stalactite, which are multiplied by mirrors of limpid water ingeniously placed beneath them; and below, there is a noiseless carpet of silver sand. A noble archway leads hence into the Alhambra Gallery, which, from the circumstance of it having been so long unpaid for, joined to that of its similarity to the Moorish court built by our own architect at Sydenham, bore the name of Owing Jones. The lofty roof, which is beautifully tessellated with intersecting lines of white marble, after extending, without a single pillar to support it, for a very great distance, suddenly sinks to a mere vaulted passage, between two and three feet in height, along which mortals have to crawl upon wooden clogs provided for that purpose. This is called the Cellar Gallery; but there is not a vestige of bin or bottle left to account for the designation; and this is the more to be regretted, as the travelling here upon all-fours is so laborious as to demand some kind of stimulant. When we have almost made up our minds to become semicircular for the rest of our lives, the roof rises unexpectedly to an enormous altitude, and a man would be enabled to straighten himself though he should stand thirty feet in his shoes. We are now in what was evidently the great chamber of audience, and it is the last in the palace to which we shall be able to penetrate. A grand, stern justice-hall it is, surrounded with objects of awe rather than of beauty. Upon the huge sombre walls are written mysterious Runic characters; and from the roof hang dusky chandeliers of stalactite, which shed a doubtful light over the scene. We are now two thousand horizontal feet from the entrance of the palace, and half as many feet perpendicular from the upper air! It is indeed Ingleborough Within, and yet we have probably not seen one-tenth of the wonders of this fairy home. A low archway leads from the hall into water, and darkness, and space, along which adventurous mortals have swum and struggled for several hundred yards further, and still have been far from finding the places whither the banished race have betaken themselves. That they are within there, somewhere, is all we must be content to know.

And now we must return along the splendid succession of hall and corridor, into daylight. The sun gleams brightly enough upon herb and leaf, upon rock and downland, but it meets with no

such glittering response as our homely candles have been evoking from stalactite and spar. This poor dull earth of ours cannot stand comparison with fairyland! Ah, who to see the rugged face of that bluff old Yorkshire mountain, would dream of the rich heart-chambers that lie in Ingleborough Within?

A MIGRATORY ROSE.

STRANGE as the heading of this paper may appear to the reader, the flower is nevertheless an entity—a thing that exists, and may be handled; a plant almost as regular as the swallow in its fittings to and fro; one that travels many miles annually; and, what is more, a fashionable one—resorting to the sea-side during the hottest season, to indulge in a swim among the cool billows of the Mediterranean. The name of this remarkable vegetable phenomenon is *Anastatica hieracantha* among the botanists; the *Rose of Jericho* with the unlearned.

Very many superstitions are connected with this extraordinary plant in the minds of Bedouins and other Arab tribes. The ancients attributed miraculous virtues to the *Rose of Jericho*. Dispensing with the notions of both, however, there remains to us quite a sufficient charm about this apparently insignificant shrub, which seldom attains six inches in height, to apologise for introducing the subject to our readers.

To behold this little rose, it is not necessary to tell you 'to go to Jericho;' no such uncomplimentary journey is required. In the arid wastes of Egypt, by the borders of the Gaza desert, in Arabia's wilderness of sands, on the roofs of houses and among rubbish in Syria, abundant specimens are to be met with. But, like many other things of insignificant exterior, few pause to look upon or handle this wayside shrub, which nevertheless carries with it a lesson and a moral.

By the laws of germination, there are, we are told, three things necessary for a plant—humidity, heat, and oxygenised air. The first of them is indispensable, inasmuch as without it the grain or seed would not swell, and without swelling, could not burst its shell or skin; and heat, in union with water, brings various gases to young plants—especially oxygen—which are necessary for its existence.

With these facts before us, and a knowledge that rain seldom falls in most places where the *Rose of Jericho* thrives, how are we to account for the extraordinary circumstance of this plant being periodically abundant and flowering at precisely the same season year after year, when, by the acknowledged laws of germination, there has been that succour wanting which is indispensable to propagate vegetation? Now appears the most remarkable and most direct interposition of nature for her offspring—an interposition little short of miraculous, and, indeed, apparently so fabulous as to be unworthy of record. But the fact has been established beyond doubt that, for its own purposes, this little plant performs annual journeys over a large extent of country, and into the ocean, whence, at a stated period, it, or rather its offspring, returns to the original haunts, takes root, thrives, and blossoms.

In the height of spring, when nature casts her brilliant vesture, set with flowers and flowerets of a hundred varied hues, over the fertile valleys and hills of Syria and part of Palestine; when every breeze is laden with rich incense from orange groves or honeysuckle dells, then unheeded, amidst the rich profusion of vegetation, or isolated amid the desert sands, blossoms the tiny *Rose of Jericho*. On house-tops, where the sun's fierce rays read crevices—on dust-heaps, where half-starved wretched curs prow and dig for food or a resting-place—where

multitudes throng the streets, and where neither foot of man nor beast has ever left imprint on the baking sand, there sprouts the wonderful *Anastatica hieracantha*. When summer has fairly set in, and flowering shrubs have ceased to blossom—about the same season of the year that Mr Bull and his family are meditating a month's trip to the seaside for fresh breezes and sea-bathing, when the whole house is turned topsy-turvy in the pleasurable excitement of packing for the month's holiday—the *Rose of Jericho* begins to shew symptoms of a migratory disposition also. How astonished Mr Brown would be if his gardener rushed in with the startling intelligence that some favourite rose-bush or other plant in the garden had evinced sudden signs of restlessness, and, after a few preliminary efforts, had quietly taken itself off for the season!

Hadji Ismail, the Bedouin camel-driver, who witnesses this phenomenon annually, encountering scores of migratory *Anastatica hieracantha*, simply pauses to stroke his prolific beard and fresh charge his pipe, while he pours into the eager ears of some untravelled novice legends about this wonderful rose—legends replete with fairy romance, in which almost invariably a certain unmentionable gentleman comes in for a volley of invectives, as being the instigator of this mysterious freak of nature.

The first symptom the *Rose of Jericho* gives of an approaching tour is the shedding of all her leaves; the branches then collapse, apparently wither, and roll themselves firmly into the shape of a ball. Like the fairies that travelled in nut-shells, this plant ensconces itself in its own framework of a convenient shape, size, and weight for undertaking the necessary journey. Not long has the flower assumed this shape when strong land-breezes sweep over the land, blowing hot and fiercely towards the ocean. In their onward course, these land-winds uproot and carry with them the bulbs or framework of our rose; and, once uprooted, these are tossed and blown over many and many a dreary mile of desert sand, till they are finally whirled up into the air, and swept over the coast into the ocean.

Soon after the little plant comes into contact with the water, it unpacks again, unfolds itself, expands its branches, and expels its seeds from the seed-vessels. Then, I presume, the mother-plant finishes her career, or is stranded a wreck upon the sea-beach. However this may be, it seems evident that the seeds, after having been thoroughly saturated with water, are brought back by the waves, and cast high and dry upon the beach. When the westerly winds set in with violence from the sea, they carry these seeds back with them, scattering them far and wide over the desert, and among inhabited lands; and so surely as the spring-time comes round will the desolate borders of the desert be enlivened by the tiny blossoms of the *Rose of Jericho*.

OCEOLA:

A ROMANCE.

CHAPTER LXXVI.—FALSE ALARM.

THE significant phrase at once put a period to my reflections. Believing the savages to be in sight, I spurred towards the front. Suddenly and simultaneously the horsemen had drawn bridle and halted. A few who had been straggling from the path now hurried up and ranged themselves closer to the main body, as if for protection. Others who had been riding carelessly in the advance were seen galloping back. It was from these last the cry of 'Indyuns' had come, and several of them still continued to repeat it.

'Indyuns?' cried Hickman, interrogatively, and with an air of incredulity; 'whar did ye see 'em?'

'Yonder,' responded one of the retreating horsemen—'in yon clump o' live-oaks. It's full o' them.'

'I'll be dog-goned if I b'lieve it,' rejoined the old hunter with a contemptuous toss of the head. 'I'll lay a plug o' Jeemes's river, it war stumps you seed! Ind'yuns don't shiew 'emselves in timmer like this hyar—specially to sech verdunts as you. Y'ull hear 'em afore you see 'em, I kalklate.'

'But we heard them,' replied one; 'we heard them calling out to one another.'

'Bah!' exclaimed the hunter; 'y'ull hear 'em dif'rent from that, I guess, when you gits near enough. It'll be the crackin' o' thar rifles y'ull hear first. Dog-gone the Ind'yun's thar. 'Twar a coon or a catbird ye've heern screamin'. I know'd ye'd make a scamper the fust thing as flittered afore ye.'

'Stay whar yez are now,' continued he, in a tone of authority—'jest stay whar yez are a bit.'

So saying, he slipped down from his saddle, and commenced hitching his bridle to a branch.

'Come, Jim Weatherford,' he added, addressing himself to his hunter-comrade, 'you come along—we'll see whether it be Ind'yuns or stumps thet's gin these fellers sech a dog-goned scare.'

Weatherford, anticipating the request, had already dropped to the ground; and the two, having secured their horses, rifle in hand, slunk silently off into the bushes.

The rest of the party, now gathered closely together, sat still in their saddles to await the result.

There was but slight trial of our patience; for the two pioneers were scarcely out of sight, when we heard their voices ringing together in loud peals of laughter.

This encouraged us to advance. Where there was so much merriment, there could be but little danger; and without waiting for the return of the scouts, we rode forward, directing our course by their continued cackinnations.

An opening brought both of them in view. Weatherford was gazing downward, as if examining some tracks; while Hickman, who saw us coming up, stood with extended arm pointing to some straggling woods that lay beyond.

We cast our eyes in the direction indicated: we observed a number of half-wild horned cattle, that, startled by the trampling of our troop, were scampering off through the woods.

'Now!' cried the hunter triumphantly, 'thar's yur Ind'yuns! Ain't they a savage consarn? Ha, ha, ha!'

Every one joined in the laugh, except those who had given the false alarm.

'I know'd thar war no Ind'yuns,' continued the alligator-hunter, 'that ain't the way they'll make thar appearance. Y'ull hear 'em afore you sees 'em: an' jest one word o' device to yur greenhorns, as don't know a red Ind'yun from a red cow: let someb'dy, as diz know, go in the devance, an' the rest o' ye keep well thegither; or I'll stake high on't thet some o' yez'll hear the night 'thout har on y'r heads.'

All acknowledged that Hickman's advice was sage and sound. The hint was taken; and leaving the two hunters henceforth to lead the pursuit, the rest drew more closely together, and followed them along the trail.

It was evident the marauders could not be far in advance of us; this we knew from the hour at which they had been seen retreating from the settlements. After my arrival on the plantation, no time had been lost—only ten minutes spent in preparations—and altogether there was scarcely an hour's difference between the times of our starting. The fresh trail confirmed the fact—they could not be a league ahead of us, unless they had ridden faster than we; but that would have been impossible, encum-

bered as they were with their black captives, whose large tracks—here and there distinctly perceptible—shewed that they were marching afoot. Of course their captors would be detained in getting these forward; and in this lay chances of overtaking them.

There were but few who feared for the result, should we be able to come up with the enemy. The white men were full of wrath and revenge; and this precluded all thoughts of fear. Besides, we could tell by their trail that the Indians scarcely outnumbered us. Not above fifty appeared to constitute the band. No doubt they were able warriors, and our equals man to man; but those who had volunteered to assist me were also of the 'true grit'—the best men of the settlement for such a purpose. No one talked of going back; all declared their readiness to follow the murderers even to the heart of the Indian territory, even into the 'cove' itself.

The devotion of these men cheered me; and I rode forward with lighter heart—lighter with the prospect of vengeance, which I believed to be near.

CHAPTER LXXVII.

A 'SPLIT TRAIL.'

It was not so near as we anticipated. Pressing forward as fast as our guides could lead us, we followed the trail for ten miles. We had hoped to find revenge at half the distance.

The Indians either knew that we were after them, or, with their wonted craft, were marching rapidly, under suspicion of pursuit. After the committal of such horrid atrocities, it was natural for them to suppose they should be pursued.

Evidently they were progressing as fast as we—though not faster.

Though the sun was broiling hot, sap still oozed from the boughs they had accidentally broken—the mud turned up by their horses' hoofs, as the guides expressed it, had not yet 'crusted over,' and the crushed herbage was wet with its own sap, and still procumbent.

'Jest half a hour ahead,' remarked old Hickman, as he rose erect after examining the tracks for the twentieth time—'jest half a hour—dog darn 'em! I never know'd red-skins to travel so fast afore. Thar a streakin' it like a gang o' scared bucks, an' jest 'bout now thar clouts are in a putty consid'able sweat, an' some o' thar duds is stannin' at an angle o' forty-five, I reckon.'

A peal of laughter was the reply to this sally of the guide.

'Not so loud, fellers—not so loud,' said he, interrupting the laughter by an earnest wave of his hand. 'By Jeroozolim, th'ull hear ye; an' if they do, th'ull be some o' us 'thout scalps afore sundown. For your lives, keep still as mice—not a word, or we'll be heern: thar as sharp-eared as thar own wolf-dogs; an' darn me if I b'lieve thar more 'n half a mile ahead o' us.'

The guide once more bent himself over the trail; and after a short reconnaissance of the tracks, repeated his last words with more emphasis.

'No, by —! not more 'n half a mile. Hush, boys; keep as quiet as 'possums, an' I promise ye we'll tree the varmints in less 'n a hour. Hush!'

Obedient to the injunctions, we rode forward, as silently as it was possible for us to proceed on horseback.

We strove to guide our horses along the softer borders of the path, to prevent the thumping of their hoofs. No one spoke above a whisper; and even then there was but little conversation, as each was earnestly gazing forward, expecting every instant to see the bronzed savages moving before us.

In this way we proceeded for another half mile, without seeing aught of the enemy except their tracks.

A new object, however, now came in view—the clear sky shining through the trunks of the trees. We were all woodsmen enough to know that this indicated an ‘opening’ in the forest.

Most of my companions expressed pleasure at the sight. We had now been riding a long way through the sombre woods, our path often obstructed by lianes and fallen logs, so that a slow pace had been unavoidable. They believed that in the open ground we should move faster, and have a better chance of sighting the pursued.

Some of the older hands, and especially the two guides, were affected differently by the new appearance. Hickman at once gave expression to his chagrin.

‘Cuss the clarin,’ he exclaimed; ‘it are a savanner, an’ a big un too. Dog-gone the thing, it’ll spoil all.’

‘How?’ I inquired.

‘Ye see, Geordy, if thar a’ready acrosst it, they’ll leave one on tother side to watch—they’ll be sartin to do that, whether they know we’re arter’em or not. Wal, what follers? We kin no more cross ’ithout bein’ seen, than a carryvan o’ kaymels. An’ what follers that? Once they’ve sighted us, in coorse they’ll know how to git out o’ our way. Judgin’ from the time we’ve been a travellin’—hey! it’s durned near sundown!—I reckon we must be clost to thar big swamp. If they spy us a comin’ arter, they’ll make strait custrut for thar, and then I know what they’ll do.’

‘What?’

‘They’ll scatter thar; an’ ef they do, we mought as well go sarchin’ for birds’ nests in snow-time.’

‘What should we do?’

‘It are best for the hul o’ ye to stop here a bit. Me an’ Jim Weatherford’ll steal forrad to the edge o’ the timmer, an’ see if they’ve got acrosst the savanner yet. Ef they are, then we must make roun’ it the best way we kin, an’ take up thar trail on the tother side. Thar’s no other chance. If we’re seen crossin’ the open groun’, we may jest as well turn tail to ’em, an’ take the back-track home again.’

To the counsels of the alligator-hunter there was no dissenting voice: all acknowledged their wisdom, and he was left to carry out his design without opposition.

He and his companion, once more dismounted from their horses; and, leaving us halted among the trees, advanced stealthily towards the edge of the opening.

It was a considerable time before they came back; and the other men were growing impatient. Many believed we were only losing time by this tardy reconnaissance, and the Indians would be getting further away. Some advised that the pursuit should be continued at once, and that seen or not, we ought to ride directly along the trail.

However consonant with my own feelings—burning as I was for a conflict with the hated foe—I knew it would not be a prudent course to pursue. The guides were right.

These returned at length, and delivered their report. There was a savanna, and the Indians had crossed it. They had got into the timber on its opposite side, and neither man nor horse was to be seen. They could scarcely have been out of sight before the guides arrived upon its nearer edge, and Hickman averred he had seen the tail of a horse disappearing among the bushes.

During their absence, the cunning trackers had learned more. From the sign, they had gathered another important fact—that there was no *longer* a trail for us to follow!

On entering the savanna, the Indians had scattered

—the routes they had taken across the grassy meadow were as numerous as their horses. As the hunters worded it, the trail ‘war split up into fifty pieces.’ They had ascertained this by crawling out among the long grass, and noting the tracks.

One in particular had occupied their attention: it was not made by the hoof-prints of horses, though some of these appeared alongside it, but by the feet of men. They were naked feet; and a superficial observer might have fancied that but one pair of them had passed over the ground. The skilled trackers, however, knew this to be a *ruse*. The prints were large, and mis-shapen, and too deeply indented in the soil to have been produced by a single individual. The long heel, and scarcely concave instep—the huge balls, and broad prints of the toes, were all signs that the hunters easily understood. They knew that it was the trail of the negro captives, who, doubtless, had proceeded thus by the direction of their guards.

This unexpected *ruse* on the part of the retreating savages created chagrin as well as astonishment. For the moment, all felt outwitted; we believed that the enemy was lost; we should be cheated of our revenge.

Some men talked of the idleness of carrying the pursuit further; a few counselled us to go back; and it became necessary to appeal to their hatred for the savage foe—with most of them a hereditary passion—once more to invoke their vengeance.

At this crisis, old Hickman cheered the men with fresh hope. I was glad to hear him speak.

‘We can’t get at ’em to-night, boys,’ said he, after much talk had been spent; ‘we dasent a cross over this hyar clarin’ by daylight, an’ it’s too big to git roun’ it. It ’ud take a twenty-mile ride to circumvent the durned thing. Ne’er a mind! Let us halt hyar till the dark comes on. Then we kin steal across; an’ if me an’ Jim Weatherford don’t scare up thar trail on the tother side, then this child never ate allygator. I know they’ll come thegither agin, an’ we’ll be like enough to find the durned varmints camped somewhar in a clump. Not seein’ us arter ’em any more, they’ll be feelin’ as safe as a bar in a bee-tree—an’ that’s jest the time to take ’em.’

All appeared to agree to the proposal of the hunter. It was adopted as a plan; and, dismounting from our jaded horses, we awaited the setting of the sun.

CHAPTER LXXVIII.

CROSSING THE SAVANNA.

I now suffered the very acme of misery. While riding in hot haste along the trail, there was an excitement, almost continuous, that precluded the possibility of intense reflection, and kept my mind from dwelling too minutely upon the calamity that had befallen me. The prospect of retribution, eye appearing near at hand—at every step nearer—all but cancelled my emotions of grief; and motion itself—knowing it to be forward, and towards the object of vengeance—had a certain effect in soothing my troubled soul.

Now that the pursuit was suspended, and I was free to reflect on the events of the morning, my soul was plunged into the deepest misery. My fancy distressed me with dire images. Before me appeared the corpse of my murdered mother—her arms outstretched, waving me on to vengeance. My sister, too, wan, tearful, dishevelled!

No wonder that, with painful impatience, I awaited the going down of the sun; I thought I had never seen that grand orb sink so slowly. The delay tortured me almost to distraction.

The sun’s disc was blood-red, from a thick haze that hung over the woods. The heavens appeared lowering and angry; they had the hue of my own spirit.

At length there came twilight. Short it was—as is usual in southern latitudes—though, on that eve, to me it appeared long and tardy in passing away.

Darkness followed; and once more springing to our saddles, I found relief in motion.

Emerging from the timber, we rode out upon the open savanna. The two hunters conducted us across in a direct line. There was no attempt made to follow any of the numerous trails. In the darkness, it would have been impossible; but even had there been light enough to lift them, the guides would have pursued a different course. Hickman's conjecture was, that, on reaching the opposite side, the marauding party would come together again at some rendezvous previously agreed upon. The trail of any one, therefore, would be sufficient for our purpose; and, in all probability, would conduct us to a camp. Our only aim, then, was to get across the savanna unobserved, and this the darkness might enable us to accomplish.

Silently, as spectres, we marched over the open meadow. We rode with extreme slowness, lest the hoof-strokes should be heard. Our tired steeds needed no taming down. The ground was favourable—a surface of soft grassy turf, over which our animals glided with noiseless tread. Our only fears were that they should scent the horses of the Indians, and betray us by their neighing.

Happily, our fears proved groundless; and, after half-an-hour's silent marching, we reached the other side of the savanna, and drew up under the shadowy trees.

It was scarcely possible we could have been observed. If the Indians had left spies behind them, the darkness would have concealed us from their view. We had made no noise by which our approach could have been discovered, unless their sentinels had been placed at the very point where we re-entered the woods. We saw no signs of any, and we conjectured that none of the band had lingered behind.

We congratulated one another in whispers; and in like manner deliberated on our future plan of proceeding.

We were still in our saddles, with the intention to proceed further. We should have dismounted upon the spot, and waited for the light of morning to enable us to take up the trail, but circumstances forbade this: our horses were suffering with thirst, and their riders were no better off. We had met with no water since before noon, and a few hours under the burning skies of Florida are sufficient to render thirst intolerable. Whole days in a colder climate would scarcely have an equal effect.

Both horse and man suffered acutely—we could neither sleep nor rest without relief: water must be reached before a halt could be made.

We felt keen hunger as well, for scarcely any provision had been made for the long march; but the pangs of this appetite were easier to be endured. Water would satisfy us for the night, and we resolved to ride forward in search of it.

In this dilemma, the experience of our two guides promised relief. They had once made a hunting-excursion to the savanna we had crossed. It was in the times when the tribes were friendly, and white men were permitted to pass freely through the reserve. They remembered a pond, at which, upon that occasion, they had made their temporary encampment. They believed it was not far distant from the spot where we had halted. It might be difficult to find it in the darkness; but to suffer or search for it were our only alternatives.

The latter of course was adopted; and once more allowing Hickman and Weatherford to pioneer the way, the rest of us rode silently after.

We moved in single file, each horse guided by the one that immediately preceded him: in the darkness,

no other mode of march could be adopted. Our party was thus strung out into a long line, here and there curving with the sinuosities of the path, and gliding like some monstrous serpent among the trees.

CHAPTER LXXIX.

GROPING AMONG THE TIMBER.

At intervals the guides were at fault; and then the whole line was forced to halt and remain motionless.

Several times both Hickman and Weatherford were puzzled as to the direction they should take: they had lost the points of the compass, and were bewildered.

Had there been light, they could have recovered this knowledge by observing the bark of the trees—a craft well known to the backwoods hunter—but it was too dark to make such a minute observation. Even amidst the darkness, Hickman alleged he could tell north and south by the 'feel' of the bark; and for this purpose I observed that he was groping against the trunks. I noticed that he passed from one to another, as if the better to confirm his observations.

After carrying on these singular manœuvres for a period of several minutes, he turned to his comrade with an exclamation that betokened surprise.

'Dog-gone my cats, Jim,' said he, speaking in an under-tone, 'these woods are altered since you an' I wur hyar: what the ole scratch kin be the matter wi' 'em? The bark's all peeled off, an' thar as dry as punk.'

'I was thinkin' they had a kewrious look,' replied the other; 'but I s'posed it war the darkness o' the night.'

'Ne'er a bit of it: the trees is altered someways, since we war hyar afore. They are broom-pines—that I recollects well enough. Let's git a bunch o' the leaves, an' see how they looks.'

Saying this, he reached his hand upward, and plucked one of the long fascicles that drooped overhead.

'Ugh!' continued he, crushing the needles between his fingers, 'I see how it are now: the durnationed worms has been at 'em—the trees are dead.'

'D' yer think thar all dead?' he inquired after a pause, and then advancing a little, he proceeded to examine others.

'Dead as durnation—every tree o' 'em. Wal, we must go by guess-work now; thar's no help for it, boys. Ole Hick kin guide you no furrer. I'm dead beat, an' know no more 'bout the direkahun o' that ere pond than the greenest greenhorn among ye.'

This acknowledgment produced no very pleasant effect. Thirst was torturing all those who heard it. Hitherto trusting that the skill of the hunters would enable us to find water, we had sustained it with a degree of patience. It was now felt more acutely than ever.

'Stay,' said Hickman, after a few moments had elapsed: 'all's not lost that's in danger. If I ain't able to guide you to the pond, I reckon I've got a critter as kin. Kin you, ole boss?' he continued, addressing himself to the animal he bestrode, a wiry old jade, that Hickman had long been master of—'kin you find the water? Gee up! ole beeswax, an' let's see if you kin.'

Giving his 'critter' a kick in the ribs, and at the same time full freedom of the bridle, Hickman once more started forward among the trees. We all followed as before, building fresh hopes upon the instincts of the dumb brute.

We had not proceeded far when it became known that the horse had got scent of the water. His owner alleged that he 'smelt' it, and the latter knew this as well as if it had been his dogs taking up the trail of a deer.

The horse exhibited signs of such an intelligence. His muzzle was protruded forward, and now and then he was heard 'sniffing' the air; in addition to this, he walked in a direct line, as if making for some desired object.

The news produced a cheering effect, and we were advancing in better spirits, when all at once Hickman drew up and halted the line.

I rode forward to him to ascertain the cause. I found him silent, and apparently reflective.

'Why have you stopped?' I inquired.

'You must all o' ye stop here a bit.'

'Why must we?' demanded several, who had pressed alongside.

'Taint safe for us to go forrad this way. I've got a idea that them varmints is by the pond. They've camped thar for sartin—it's the only water thar is about hyar; an' it's devilitch like that thar they've come thegither an' camped. If that be the case, an' we ride forrad in this fashion, they'll hear us a-comin', an' be off agin into the bushes, whar we'll see no more o' 'em. Ain't that like enough, fellers?'

The interrogatory was answered in the affirmative.

'Wal, then,' continued the guide, 'better for yez all stay hyar, while me an' Jim Weatherford goes forrad to see if the Indyans is thar. We kin find the pond now. I know whar it lies by the direkshun the hoss war takin. It ain't fur off. If the redekins ain't thar, we'll soon be back, an' then yez kin come on to it.'

This prudent course was willingly agreed to; and the two hunters once more dismounted, and stole forward afoot. They made no objection to my going along with them; my misfortunes gave me a claim to be their leader; and, leaving my bridle in the hand of one of my companions, I accompanied the guides upon their errand.

We walked with noiseless tread. The ground was thickly covered with the long needles of the pine, forming a soft bed, upon which the footstep made no sound. There was little or no underwood, and this enabled us to advance with rapidity. In ten minutes we had separated far from our party.

Our only care was about keeping the right direction. This we had almost lost—or believed so—when, to our astonishment, we beheld a light shining through the trees. It was the gleam of a fire that appeared to be blazing freely.

Hickman at once pronounced it the camp-fire of the Indians.

At first, we thought of returning and bringing on our party; but upon reflection, it was determined to approach nearer the fire, and make certain whether it was the enemy's camp.

We walked no longer in erect attitudes, but crawling on hands and knees. Wherever the glare penetrated the woods, we kept under the shadow of the tree-trunks. The fire burned in the midst of an opening. The hunters remembered that the pond was so placed; but we now saw the sheen of water, and knew it must be the same.

We drew nearer and nearer, until it was not safe to advance further.

We had arrived at the edge of the timber that surrounded the opening; we could see the whole surface of the open ground: there were horses picketed over it, and dark forms recumbent under the fire-light. They were murderers asleep.

Close to the fire a man was seated upon a saddle; he appeared to be awake, though his head was drooped to the level of his knees. The blaze was shining upon his face; and both his features and complexion might have been noted, but for the interposition of paint and plumes. The face appeared of a crimson red, and three black ostrich feathers fell straggling over his temples till their tips almost touched his

cheeks. These plumed symbols produced a painful recognition; I knew that it was the head-dress of Ogeola.

I looked further. Several groups were beyond; in fact, the whole open space was crowded with prostrate forms.

There was one, however, that soon occupied my whole attention. It was a group of three or four individuals, seated or reclining along the grass. They were in shade, and from our position, their features could not be recognised; but their white dresses, and the outlines of their forms—soft, even in the obscurity of the shadow—told that they were females. Two of them were side by side, a little apart from the rest; one appeared to be supporting the other, whose head rested in her lap.

With emotions fearfully vivid, I gazed on these two forms; I had no doubt they were my sister and Viola.

THE MONTH:

SCIENCE AND ARTS.

THE most lively floating topics of late are: the preparations for laying down the Atlantic telegraph cable—the fitting up of the *Leviathan*—the new arrangements, and the Technological Museum at the Crystal Palace—the opening of the Royal Academy Exhibition with an admirable collection of paintings—the underground railway—the London drainage, and Thames embankment question—the recasting of Big Ben, and the noble aspect of the Parliament House, now that the towers are stripped of their scaffolds—Professor Owen's lectures on palæontology at the School of Mines—the soirées given at Burlington House, by Lord Wrottesley, president of the Royal Society, and Mr Bell, president of the Linnæan Society—and the fifteen candidates selected for election into the Royal Society, among whom are David Livingstone, Harvey the psychologist, Haughton the geologist of Dublin, H. D. Rogers of Boston, now professor of natural history at Glasgow, Waugh, chief of the trigonometrical survey of India, and discoverer of Mount Everest, the highest peak of the Himalayas, and others of good repute. Moreover, people have not yet left off talking about Buckle's *History of Civilisation*, a book of 800 pages, which comprise a part only of the introduction. What will the history itself number? Most readers consider the book to be like the author's lecture *On Women* at the Royal Institution: brilliant, but fallacious. Mr Buckle, nevertheless, is perhaps the most remarkable person now rising in the literary hemisphere. He is described to us as a young man of fortune, who, up to eighteen, received scarcely any education—has never been at any school or college—but has nevertheless studied profoundly, and made wonderful acquirements. He lives quietly with his mother in London, and may be said to spend his days and nights amongst books, of which he possesses a vast store.—And students are congratulating one another, and Mr Panizzi, on the success of the new reading-room at the British Museum, as proved by the fact, that it was visited by 94,370 readers in 1857; that is, including the visits to the old room from January to May, the new room not having been opened till the latter month. This is a triumph, and Londoners may well be proud of a room which has not its equal in the world. The number of readers in 1856 was 53,422.

As regards the telegraph, there appears now to be a better chance of success than could by any possibility have been expected last year, considering the hurried way in which the preparations were made. Great schemers too often forget that time shews but little respect to the things he has not had a pretty good share in the formation of. In the present

instance, the cable has been coiled on board the *Agamemnon* and *Niagara*, with all needful carefulness; and an almost self-acting paying-out machine or break has been constructed, which is to obviate all the shocks and plunges a ship encounters on a rolling sea. Mr Appold has applied to this break the principle of his crank, so much detested by prisoners condemned to hard labour, as much for its utter unprofitableness, as for its distressing monotony. Henceforth, the unlucky wind-grinders will have the satisfaction of remembering that for once the crank has done noble service. The two vessels are to steam away to the centre of the Atlantic, where the two lengths of cable will be united, and then *Agamemnon* will make the best of her way to Newfoundland, and *Niagara* to Valentia Bay, and each thus having the shortest possible voyage, we may hope that the grand experiment will be crowned with the success it so eminently deserves. The interest it has excited may be judged of from the fact that the institution of Civil Engineers spent four evenings of their ordinary meetings in a discussion as to the best method of sinking the cable to the bottom of the sea, and of preserving it there. It was generally thought that a coat of concrete would form round the cable, and give sufficient protection.

The Crystal Palace, besides certain desirable improvements in the interior arrangements, has now, in the second gallery of the great transept, an excellent collection of natural products and manufactures, forming an instructive technological museum. It has been arranged and classified by Dr Price; and now, with this and the museums at Kensington and the British Museum, it will be the Londoners' own fault if they become not well informed on common things, and uncommon things too.

As regards the metropolitan drainage-question, a new report has been drawn up, shewing that the former estimated cost may be reduced in amount: it recommends that the outfalls should be placed on each bank of the Thames between Woolwich and Erith; and asserts—what has long been known by those best acquainted with the subject—that the statements so often made as to the noxious influence of the Thames is an exaggeration. A tidal river must necessarily be muddy; the water in its recurrent flow produces no ill effects; it is the mud-banks only which taint the air. Hence, by carrying the outfalls down to the locality proposed, and by embanking the stream in its passage through the metropolis, the deposition of mud will be prevented, and the bottom will never be left dry at low-water. The most harmful condition of river-water is when mixed with seawater, as near the mouth. The report insists upon the embankments, not only for the improvement of the channel, but also for the architectural embellishment of the city, and the recreation of the inhabitants. And are not open spaces for recreation indispensable in a city where, as in the week ending March 13, a child is born every five minutes? There is to be a new park of forty acres in the neighbourhood of the Kensington Museum; why not lay out Smithfield as playground for the benefit of those who do not live at Kensington? Play favours physical development; hence London and Londoners would alike be gainers.

Papers have been read and discussed before the Society of Arts, on the progress of the electric telegraph—on iron—and the progress and present state of British mining; the last no unimportant subject, seeing that our metalliferous products are valued at £35,000,000 a year. One of the results of the war with Russia was a marked improvement in the manufacture of iron, and this has suggested the way for further improvements. Bessemer's process is still being experimented on, with a view to perfection; and there is another kind of interest attaching to

mining subjects: a plan has been laid before the Scottish Society of Arts by Mr Robert Aytoun, for working coal-mines in a way that renders explosions impossible; and he suggests that in mines worked on the present system, 'rooms of refuge' should be established, to which, in case of explosion, the miners might fly from the effects of the after-damp.

Mr Mallet has returned from Naples with a full report of the terrible, yet interesting phenomena of the earthquakes which occurred in that kingdom a few months ago. He found that the particulars hitherto published concerning the catastrophe are by no means exaggerated. Whole districts are literally ruined, turned upside down, as it were; and one of the towns through which he passed—a place as large as Tamworth—was, to use his own figure of speech, reduced to powder. He explored the effects of the shocks as far as they were visible in all directions, and has arrived at many important conclusions as to earthquake phenomena generally; all of which, as well as details of his journey, and pictures of the havoc, will appear in due time in a scientific journal. The journey, made in a severe season, exposed him to much privation; and besides witnessing the frightful destitution, he was attacked by fever, and delayed thereby for three weeks.

In France, M. Beclard has made some curious experiments on the Influence of Light on Animals, and finds that those creatures which breathe from the skin, and have neither lungs nor branchiæ, undergo remarkable modifications under different coloured rays. He exposed the eggs of flies (*Musca carnaria*) under bell-glasses of six different colours: little maggots were hatched from all; but those under the blue and violet rays were more than a third larger than those under the green. Frogs, which by reason of their naked skin, are very sensitive to light, give off half as much more carbonic acid in a given time under the green ray as under the red; but if the frogs are skinned, and the experiment is repeated, the excess is then with those under the red ray. Frogs placed in a dark chamber lose one-half less of moisture by evaporation, than when placed in common daylight. Hence it appears that these poor amphibians, which some physiologists believe were created for experimental purposes, after having furnished data as to the phenomena of the muscular and nervous systems, the effect of poisons on both, and thereby advancing the science of physiology, are now to be tortured into manifestations of the influence of light, for the benefit of humanity.—M. de la Rive, in the third volume of his *Treatise on Electricity*, just published, reviews the whole science of electrophysiology; and reminds practitioners that, as the difference between the electricity of the muscles and of the nerves is now clearly established, so must they be careful in applying their remedies, not to waste on the muscles, which are the best conductors, the electric currents intended solely for the nerves.

The Geological Society have had a paper on 'Changes of Level in Sicily, Wales, and Scotland;' and one on the 'Natural Origin of Rock Basins'—a question which, it might be thought, had been decided long ago in favour of nature. Sir Charles Lyell is busily employed on the important subject of volcanic geology; and it appears, to the no small pride and encouragement of geologists, that the more discoveries are made in their favourite science, the more do there appear still to make. Mr Henwood, while considering the numerous observations he has made on the temperature of mines, sets on foot the inquiry: whether the heat below the surface is caused by central fire, or by the simple juxtaposition of different rocks? And talking of mines, there is something to wonder at in the returns from the Burra Burra copper-mines, South Australia. The first excavations were made

in September 1845, by twelve miners; now the number of miners is more than a thousand, the ore hitherto dug has yielded 23,000 tons of copper; and a settlement numbering 5000 souls is established in the neighbourhood.—By news from Bahia we learn that about eighty leagues from that city, near the San Francisco river, a great natural deposit of nitrate of soda has been discovered, extending for sixteen miles along a valley.—Mr Colquhoun Grant, in a paper published by the Geographical Society, gives a description of Vancouver's Island, well worthy of consideration, seeing how much has been said concerning that island as a field for emigration. It is 270 miles long, and from 40 to 50 miles wide on the average, with but comparatively a small proportion of land available for cultivation, which is found upon the coast. The interior is described as hopelessly barren and dreary. The settlement of Victoria, founded in 1843 by the Hudson's Bay Company, is one of the pleasantest sites. But worst of all is the climate; nothing but snow and rain from October to March, and parching heat for the rest of the year. In the words of the Jesuit missionary—'huit mois d'hiver, et quatre mois d'enfer.'

Another fact connected with geology is the composition of building sandstones, on which some important information has recently been laid before the Royal Society of Edinburgh. Mr Bloxam made experiments on sandstone taken from Craigleith quarry and other places near Edinburgh, and finds, as one of the causes of disintegration, that even pure water will dissolve something out; carbonic acid more; and free mineral acids, such as are found in the rain-water of towns, most. The absorbent power is astonishingly great: a block of stone, submitted to a drying process, lost nearly six fluid ounces to the cubic foot; another block, soaked in water, gained more than three pints and a half to the cubic foot. Remarkings on these properties, Dr George Wilson truly says, 'the error of those who hope to render buildings dry, by constructing their walls of solid sandstone, will be sufficiently apparent.' Architects and builders will do well to bear these facts in mind when drawing plans for new houses, or when examining the specimens of building-stone from Scotland in the Crystal Palace.

An inquiry instituted by the Belgian government merits attention. For some years, a notion had grown into a belief that certain manufactories were prejudicial to health and vegetation, and so much disquiet arose thereupon, especially in the province of Namur, that the governor reported it to the home department at Brussels. A commission was appointed, two chemists and two botanists, who, commencing their inquiry in June 1855, pursued it carefully for several months, confining themselves to factories in which sulphuric acid, soda, copperas, and chloride of lime were made. The two chemists watched the processes, and noted the escape of gases from the chimneys. They consider soda-factories to be the most noxious, and tall chimneys more hurtful than short ones, because of the greater surface over which they diffuse the vapours; and tall chimneys, by quickening the draught, discharge gases which otherwise would be absorbed in the passage. Hence, contrary to the commonly received opinion in this country, they hold that there is less dispersion of deleterious vapours with a short chimney than a tall one.

The botanists on their part shew, as might be anticipated, that the effect on vegetation is most shown in the direction of the prevalent winds, and more during rains and fogs than in clear weather. They establish beyond a doubt the hurtful influence of smoke, due to the presence of hydrochloric and sulphuric acid, and they find that the greatest

distance at which the mischief is observable is 3000 metres (a little over an English mile); the least 600 metres. They enumerate thirty-four kinds of trees which appear to be most susceptible of harm, beginning with the common hornbeam (*Carpinus Betula*), and ending with the alder; and between these two occur, in sequence, beech, sycamore, lime, poplar, apple, rose, and hop. As regards the effect on the health of men and animals, the commission find the proportion of deaths per cent. to be lower now in the surrounding population than before the factories were established: from 1 in 55 it has fallen to 1 in 65. One reason for this improvement may consist in the better means of living arising out of the wages earned in the factories. However, the commission wind up their report with an assurance that health, either of men or horses, suffers nothing from the factories, and vegetation so little, that farmers and gardeners may dismiss their fear, and the government refrain from interfering.

The Academy of Sciences at Vienna is actively engaged in multiplying stations for meteorological observation throughout the Austrian empire.—In Upper Canada, the education office at Toronto has made arrangements whereby certain senior grammar-schools all over the province shall be furnished with trustworthy instruments made in England for taking complete series of observations; from all of which we may hope for valuable results.—There are, again, certain curious weather-facts to record: on the 21st of April it was hotter in Turin—45 degrees—than in any of the stations in correspondence with Paris, two of which are Algiers and Madrid; but here in London on the 16th of the same month, the temperature rose to 76 degrees, and the day ended with a heavy thunder-storm.

Lovers of ancient art will be gratified to hear that a considerable collection of the *Bedrum antiquities* are now in the British Museum. They are believed to be of the age of Mausoleus.—The postmaster-general's report shews that the number of letters delivered within the United Kingdom in 1857 was 504,000,000, an increase of 26 million over 1856. As many letters pass through the Manchester post-office alone as were delivered in the whole of Russia in 1855—namely, 16 million. The average distribution of that astounding number of letters was 31 to every person in England, 16 in Scotland, and 9 in Ireland.

DR ELIZABETH BLACKWELL.

It is not customary for one periodical work to make extracts from another; but there may be instances in which a breach of the rule will be held as justified. We find, in the second number of a new monthly magazine, styled the *English Woman's Journal*, a piece of actual life-history of a most heroic and touching character. By presenting some parts of it to a wider circle of readers, we believe we shall be at once improving the hearts of our friends by a profoundly interesting story, and making known to them a clever and promising aspirant of the periodical press, having specially in view the advancement of the interests of womankind. The narrative is an account of the professional education of a young Englishwoman reading in America, who has somewhat astonished the world by becoming a regular diplomated physician, and settling in that capacity in New York. The narrative is the production of an admiring and sympathizing sister. Elizabeth Blackwell was the eldest of a family of seven, thrown with their mother on the world by the early death of their father in embarrassed circumstances. She had a severe struggle for some years, striving to maintain herself and help the junior branches by teaching. At length, having by inconceivable self-denial saved a little money, she entered upon a course of education for the profession of a physician, being of opinion that women are fitted to become medical practitioners, and that she would be doing her

sex some service by shewing them the way. It will be found in the ensuing extract, what difficulties, in addition to those of poverty, she had to overcome before the attainment of her wishes.

'In May 1847, after three years of incessant application, during which the closest study had occupied every moment not engaged in teaching, she left Charleston, and went to Philadelphia, where she endeavoured to obtain admittance to the medical schools, but without success. The physicians at their head were either shocked or angry at her request, and the doors of all those schools were closed against so unprecedented an application; and finding it impossible to avail herself of the facilities provided for students of the other sex, she now entered upon a course of private anatomical study and dissection with Professor Allen, and of midwifery with Dr Warrington of Philadelphia. But although she could undoubtedly learn much from the private lessons of competent instructors, she felt that so fragmentary a mode of study could not give her the solid medical education resulting from a regular collegiate course; and, moreover, as it was her aim not to incite ignorant or half-educated female pretenders to an unauthorised assumption of the physician's office, but, on the contrary, to procure the opening of the legitimate approaches of the medical career to women seriously desirous to qualify themselves for the worthy discharge of its duties, by passing through the course of preparation prescribed to men, her admission to a regular medical college, and the acquisition of the medical diploma—as a sanction for her own course and a precedent for other women—were essential to the carrying out of her plans. She therefore procured a list of all the medical colleges in existence in the United States, and proceeded to address an application for admission to each of them in succession.

"I am sending out arrows in every direction, uncertain which may hit the mark," she remarks in a letter written at this time.

'Her application, though accompanied by a certificate of her having gone through the requisite preparatory study under Dr Dickson, was refused by twelve medical colleges. In some cases, the refusal was couched in the shape of a homily on the subordinate position assigned to woman by nature and society, and her presumption in wishing to enter a sphere reserved to the nobler sex; or an exposition of the impropriety and indelicacy implied in a woman's attempting to learn the nature and laws of her own physical organisation. For several months it appeared as though even her tenacity of purpose would fail to break through the barriers of prejudice and routine opposed to her on every side. But at length her path, so long obstructed, began to grow clearer.

'Among the applications she had made throughout the length and breadth of the United States, one had been addressed to the Medical College of the University of Geneva, in the state of New York. The faculty of that institution having considered her request, agreed that they saw no reason why a woman, possessed of the requisite preparatory acquirements, should not be admitted; but feeling that the question was one whose decision must rest, practically, with the students themselves—as it would have been easy for them, if so disposed, to render a place in the amphitheatre untenable by a lady—they determined to refer the matter to them, and, having called them together, left the application with them for examination and decision. The students, having discussed the subject, decided unanimously in favour of the new applicant; and a "preamble" and "resolutions" were drawn up and voted by them, inviting her to enter the college, and pledging themselves "individually and collectively, that, should she do so, no word or act of theirs should ever cause her to regret the step."

'A copy of these "resolutions," accompanied by a letter of invitation from themselves, having been transmitted to her by the faculty of the university, she went to Geneva in November of that year, was entered on the college books as "No. 417," and threw herself into the study of the various branches of medical learning thus opened to her, with an ardour proportioned to the

difficulties she had had to overcome in gaining access to them.

'But the position she had striven so hard to attain was not without certain inconveniences, inseparable from the nature of the case; and though she had weighed, and was prepared to endure them, for the sake of the knowledge that she could obtain in no other way, it will be readily understood that a young and sensitive woman could not find herself placed in so novel a situation, and assist at all the demonstrations involved in a complete course of medical exposition, without occasional severe trial to her feelings. Aware that the possibility of her going through with such a course depended on her being able, by her unmoved deportment, to cause her presence there to be regarded, by those around her, not as that of a woman among men, but of one student among five hundred: confronted only with the truth and dignity of natural law, she restricted herself, for some time after her entrance into the college, to a diet so rigid as almost to trench upon starvation, in order that no involuntary change of colour might betray the feeling of embarrassment occasionally created by the necessary plain-speaking of scientific analysis. How far the attainment of a self-command which rendered her countenance as impassable as that of a statue can be attributed to the effect of such a diet, may be doubtful; but her adoption of such an expedient is too characteristic to be omitted here.

'From her first admission into the college until she left it, she also made it an invariable rule to pass in and out without taking any notice of the students; going straight to her seat, and never looking in any other direction than to the professor, and on her note-book.

'How necessary was her circumspection to the prosecution of the arduous task she had assumed, may be inferred from an incident which occurred during the lecture in the amphitheatre, a short time after her admission. The subject of the lesson happened to be a particularly trying one; and while the lecturer was proceeding with his demonstration, a folded paper—evidently a note—was thrown down by somebody in one of the upper tiers behind her, and fell upon her arm, where it lay, conspicuously white, upon the sleeve of her black dress. She felt, instinctively, that this note contained some gross impertinence, that every eye in the building was upon her, and that, if she meant to remain in the college, she must repel the insult, then and there, in such a way as to preclude the occurrence of any similar act. Without moving, or raising her eyes from her note-book, she continued to write, as though she had not perceived the paper; and when she had finished her notes, she slowly lifted the arm on which it lay, until she had brought it clearly within view of every one in the building, and then, with the slightest possible turn of the wrist, she caused the offensive missive to drop upon the floor. Her action, at once a protest and an appeal, was perfectly understood by the students; and, in an instant, the amphitheatre rang with their energetic applause, mingled with hisses directed against her cowardly assailant. Throughout this scene she kept her eyes constantly fixed upon her note-book, taking no more apparent notice of this welcome demonstration than she had done of the unwelcome aggression which had called it forth. But her position in the college was made from that moment; and not the slightest annoyance of any kind was ever again attempted throughout her stay. On the contrary, a sincere regard at once kindly and respectful, was thenceforward evinced towards her by her fellow-students; and though, for obvious reasons, she still continued to hold herself aloof from social intercourse with them, yet, whenever the opportunity of so doing presented itself in the course of their common studies, they always shewed themselves ready and anxious to render her any good offices in their power, and some of them are among her truest friends at this day.

'The feeling of embarrassment which had caused her so much pain on her first appearance among her fellow-students was, however, soon modified by familiarity with

topics forming the subject of daily study, and was at length entirely absorbed in the growing interest and admiration excited by the wonderful and beautiful mechanism of the human frame. But the suffering it had caused her, on her entrance into the college, suggested to her the desirability of providing a first-class medical school for the reception of female students only—an institution which she hopes to establish in the course of time.

But though the "lady-student" had thus made good her position within the walls of the college, the suspicious and hostile curiosity with which she was regarded in the little town was long in subsiding. She could not, at first, obtain admission to a suitable boarding-house; the heads of those establishments having been threatened with the desertion of their "best" inmates if she were received. As she went through the streets, on her way to and from the college, audible whispers of "Here she comes!" or rude cries of "Come on, Bill, let's have a good look at the lady-doctor!" would meet her ears; and not only idle boys, but well-dressed men and women, would place themselves before her, or draw up in little knots along the pavement, to see her go by, as though she had been some strange animal from another planet. But the passage of the quiet-looking little figure, dressed with the utmost simplicity, taking no notice of the rude people about her, and looking neither to the right hand nor to the left, gradually ceased to excite remark; and when she had been called upon by the wives of some of the professors, the most "respectable" of the boarding-houses consented to receive her as an inmate. . . .

From the time when she had first resolved to enter upon the study of medicine, until a very recent period, she pursued a system of self-denial in every branch of personal expenditure so rigid that it would be hardly credible to those who had not witnessed its details, and involving privations that only her exceptional temperament could have enabled her to undergo. Her arrangements were invariably made on the most inexpensive scale; she put up with the simplest accommodations, dressed with more than Quaker plainness, went about on foot in all weathers to the utmost limit of her strength, and resolutely denied herself everything, without exception, that it was possible for her to do without. Her refusing herself a little bottle of eau de Cologne, which she could have bought for fourpence-half-penny, and to which, being very fond of scents, she happened one day to take such an especial fancy that she was haunted for years with occasional visions of that same little bottle, was in accordance with the invariable rule she had marked out for herself. Acts of rare generosity on her part towards others during this period might be cited; but with regard to herself—although additional resources were placed at her disposal by her relatives in England—her self-denial was inexorable; every farthing thus economised being regarded by her as so much gained for the exigencies of future study, and treasured accordingly. Such having been her mode of action from the beginning of her student's career, it was not without an almost heroic effort that, as her course of study drew towards its close, she compelled herself to purchase a handsome black silk dress for the grand affair of her graduation. In a letter written at that time, she says: "I am working hard for the parchment, which I suppose will come in due time; but I have still an immense amount of dry reading to get through with and to beat into my memory. I have been obliged to have a dress made for the graduation ceremony; and meanwhile it lies quietly in my trunk, biding its time. It is a rich black silk, with a cape, trimmed with black silk fringe, and some narrow white lace round the neck and cuffs. I could not avoid the expense, though a grievous one for a poor student; for the affair will take place in a crowded church; I shall have to mount to a platform, on which sits the president of the university in gown and triangular hat, surrounded by rows of reverend professors; and of course I can neither disgrace womankind, the college, nor the Blackwells, by presenting myself in a shabby gown."

In January 1849, the ceremony in question took

place, as just described. The church was crowded to suffocation; an immense number of ladies being present, attracted from every point of the compass, from twenty miles round, by the desire to witness the presentation of the first medical diploma ever bestowed on a woman; and among the crowd were some of her own family, who had come to Geneva to be present on the occasion. When the preliminary ceremonial had been gone through with, and various addresses had been delivered, the wearer of the black silk dress ascended to the platform with a number of her brother-students, and received from the hands of Dr Lee, the venerable president of the university, the much-desired diploma, which with its seal and blue ribbon, and the word *Dominus* changed to *Domina*, admitted her into the ranks of the medical fraternity, hitherto closed against her sex. Each student, on receiving the diploma, returned a few words of thanks. On receiving hers, Dr Elizabeth replied, in a low voice, but amidst a hush of curiosity and interest so intense that the words were audible throughout the building:

"I thank you, Mr President, for the sanction given to my studies by the institution of which you are the head. With the help of the Most High, it shall be the endeavour of my life to do honour to the diploma you have conferred upon me."

The president, in his concluding address, alluded to the presence of a lady-student during the collegiate course then closing, as "an innovation that had been in every way a fortunate one;" and stated that "the zeal and energy she had displayed in the acquisition of science had offered a brilliant example to the whole class;" that "her presence had exercised a beneficial influence upon her fellow-students in all respects;" that "the average attainments and general conduct of the students during the period she had passed among them were of a higher character than those of any class that had been assembled in the college since he had been connected with the institution;" and that "the most cordial good wishes of her instructors would go with her in her future career."

Dr Elizabeth Blackwell is now a highly successful doctor at New York, where she has been latterly joined by a junior sister, Dr Emily Blackwell, who has passed through the same professional education with equal éclat, but under greatly less difficulty.

DEEDS, NOT WORDS.

WHEREFORE bid me say I love you?

Nay—appeal you to the past;

If my deeds no tale have told you,

Words may to the winds be cast;

These, though every hour repeated,

Ne'er had held your heart so fast.

Years ago I would not bind you,

Though your pledge you bade me take;

Lest some future day should find you,

For your honour's, not my sake,

Riveting, before God's altar,

Chains you rather longed to break.

Think not that your love I doubted

Even in its earliest spring;

But I asked myself the question:

What will years of waiting bring?

God be thanked—the trial ended,

Both our hearts the closer cling.

Why, then, bid me say 'I love you;'

Look into the past, and see

If each thought of mine and labour,

Were not for us—not for me.

Deeds, not words, have bound us—may we

Still by them united be.

Grimsby.

SATURDAY, JUNE 5, 1858.

Price 1½d.

A PARISIAN SOIRÉE.

Nor very long ago, I, Beatrice Walford, paid my first visit to Paris, and stayed there some time. I was very young, very fresh, and ardent in those days. I was open-eyed, open-eared, eager to enjoy, prone to admire, and not unwilling to criticise. I started, to be sure, with a great contempt for the French character: I knew that the men were monkeys, and not to be trusted; that the women were vixens, and given up to dress. This was all the mental provision I had made for my two years' residence amongst them. Otherwise, I entered almost in that state of innocence which finds it astonishing that the natives of France should speak French. My first single emotion was delight at the radiant world I found myself in. I was on a visit to a sister, who, some six years before, had married a French gentleman of the *petite noblesse*, had become a widow, and having lived a good deal in Paris, preferred still to reside there, but was very glad to have me, as she said, to give a little liveliness to her '*triste home*.' I did not myself think it at all triste when I first arrived. It was in that bright bit of Paris, the Avenue des Champs Elysées, one of a row of elegant houses, all glittering in their brilliant white stone, with their moulded and gilded façades on each side of those broad sunny walks and their double avenue of trees. And did not my sister's small, pretty apartment open on me as a tiny Peri palace, as on entering the ante-chamber, I heard the gay piano sounding, and just saw into the bright little drawing-room within, where the sun, shining in from the Champs Elysées, played on a little shrine, gay and fragrant with flowers. And like the nymph of flowers and fragrance herself, came forward my graceful sister, to kiss and smile at me. When the first vague, happy greetings were over, she made me sit by the fire, and threw herself carelessly back in a low chair by my side, playing with her little queen-baby, a rose-and-white child with two dancing sapphires of eyes. We were soon laughing together, for she was excitable and easily amused, and, though older by some years than I, more of a child. The dear Sybil! I never could describe Sybil, she was such a delicate blending of counter-elements—white nymph-like figure, with ethereal complexion, and golden-brown hair, and a kind of celestial sweetness in her eyes, and her still smile. The admiring Frenchman, *monsieur or ouvrier*, would pronounce her in the streets a *blonde angelique*; and I have known a lecture or concert room fill with a low general murmur of pleasure as she entered, followed by the not whispered

word '*Anglaise*.' But beyond that white charm, I do not know that Sybil was particularly English; there was a life and play, a foreign grace in dress, manner, and speech, that seemed to have been kindled in a warmer, more exciting atmosphere than ours. I believe that, nevertheless, the quick French eye could discern, underneath, the English simplicity and spontaneity which has so complete a charm of its own. Perhaps she was something of a coquette, but I did not mind that.

'Why, Sybil, it seems to me,' I said, as I leaned out on the light iron *grillage* of the balcony, 'that one can see all Paris without stirring from one's place. It is as if all the world was gathered into a picture below these windows for our amusement. From that bronze fountain, with its silvery jet-and-foam halo, in the Place down there, to that arch of triumph, so cut out in the blue air at the other end, it is all a dream.'

'There goes the President,' said Sybil; and I looked, though the name was not then much of a spell. I saw a low-hung, elegant *calèche*, with four horses, valets and postillions in livery of green and gold; and leaning back in it, with folded arms, a slight, inanimate-looking man, of clayey, or rather leathery complexion, who touched his hat now and then, with a wooden, immovable face, to the scant greetings of the passers-by. That tired and passionless man was patiently biding his time, seeing by the light of his star—in what appeared to others the dark chaos of his future—a clear, sharp path up to strange power and grandeur for himself; and in the dark silent workshop of his brain, forging with the hammer of his iron will the chain that he threw over France in a single hour. Was he laughing deep down at the folly of those who despised him, because, unlike themselves, he knew how to form his own plans, and hold his tongue?

To me, as to the rest of that unforeseeing world, all was enjoyment—the enjoyment of eyes ever pleased, never satiated. The day was given, as were many after-days, to walking through this brilliant modern Paris, admiring her in her ordered and stately grace; then wandering into the gloom and squalor of the older city, entering grand buildings, the shrines of past ages—hearing divine thunders and angelic voices in churches; then, at one step again, amidst a torrent of human life, while the quick French nature seemed ever running like a light sound of laughter or music by our side. It was always a pleasure to come back to our own street, with its regular clean white houses, its row of windows *à deux battans* on the upper stories, all opening down to the floor upon long

light balconies of prettily carved ironwork, the white and green *persiennes* thrown back against the walls, shewing the fair muslin curtains within, and all shining as nothing in London ever shines. We approach our own house; the great double doors fly open at a touch of the bell, and by the pull of a string, and before us appears a large handsome court, with two or three glass-doors at the end, one into the *concierge's* lodge, the others opening on the great common staircase. Within, is another large court, built round by the four sides of the house. The outer court is adorned with flowers in boxes, dahlias, oleanders, and orange-trees; a marble Venus stands at the foot of the staircase. As we pass the *concierge's* lodge, I see, through the glass-door, the comfortable-looking room, lighted with fire and candle, and that grim, respectable old dragon and his wife reclining at their ease in *fauteuils* placed opposite each other. In the *loge* or the court is often to be seen that prime French favourite, a superb Cyprus cat, with waving, plummy exuberance of fur. But when I inquire after him, I am so often sternly told that 'Monsieur se promène,' that I have given up this dissipated gentleman as scarcely a respectable acquaintance.

Then comes the wide staircase, up whose smooth well-waxed *parqueted* steps we trip so easily. But stop, I must learn to walk demurely, at least when I am alone; for I am told by Sybil's careful *bonne*, who watches over my morals, that on such occasions *les demoiselles* must not run up stairs; they must go *la tête relevée*, and leisurely, to shew that they are not ashamed of being seen. I must be careful too, short-sighted as I am, to see the *concierge*, wherever he may be, and to bow to him, for he is a man of lofty politeness, whose good manners I ought at least to try to imitate; and, as Gabrielle says, nothing is so necessary to *demoiselles*, nothing so carefully taught them in France, as a gracious and careful deportment. So up we pass, only bowed to by some stranger *locataire*, should he pass at the same time, each landing-place exhibiting the safe-locked door of some elegant asylum in which a family may be dwelling, joyous, yet quiet, as at home in some English country cottage. We reach our own. Sybil and I each take possession of a deliciously elastic *causeuse*, all soft and rich with crimson velvet, see our own pleased tired faces in many a gilded mirror, and discuss the incidents of the day.

'Well, you little Anglaise,' said Sybil, a few days after my arrival, 'I must take you into a little society this evening. Very often I have two or three friends myself, who drop in, in a quiet way; but to-night we must go to Madame Gibbs.'

'Who is Madame Gibbs?' I asked.

'Oh, she is a droll little body—a Frenchwoman, married to an Englishman, who piques herself on being quite English, though you won't think so. Her society is very mixed; but the party will just suit you for a beginning, being quiet, yet very amusing. How do you expect to like it, from the specimens of humanity you have seen by day?'

'I confess,' I said, 'I am not yet so far reconciled to black beards and moustaches, cigars, absurdly cut clothes, and prolonged stares. Not that I long to kill every man I meet; but this, you will say, is illiberal; and perhaps it is.'

'It seems to me so,' said Sybil candidly; 'but then I have been some years learning toleration. As for staring and talking to one, you know, there are two things a Frenchman never can help using, his eyes and his tongue. As that dear Monsieur Lamonette once said to me, when, being younger, I objected a little to the process—no impertinence is intended; it is only an artless, spontaneous tribute. "Un homme naïf et ingénu comme moi," as he was pleased to say, "can't help expressing his feelings."

But I have since grown so hardened or corrupted, that when the more serious Emile said to me: "Comment, madame, osez vous quelquefois vous promener seule? vous visrez d'entendre des choses désagréables;" I answered with the most innocent fifteen-years old air: "Les choses que j'entend ne me sont pas désagréables." But I don't wonder that you do not yet feel accustomed to hearing varying statements as to your nationality and candid information about your "typé, your hair, and your complexion." But wait for this evening's experience; Frenchmen in the street and in the *salon* are not the same thing. At anyrate, don't utter those opinions before Hermine, as, though she may very possibly think the same, she may also betray you to her countrymen.'

'Parlez du soleil et vous verrez ses rayons.' Just as Sybil spoke, the door opened, and in came two ladies—an elder and a younger, of whom the latter engaged at once my beauty-loving eye. They were Madame de Fleury—Sybil's mother-in-law, who lived in the same hotel, on a lower floor—and her young daughter, Hermine, with whom I instantly made acquaintance. A brilliant little French sylph she looked, as she half-tripped, half-glided into the room. She moved quick and decidedly, with a grace half-careless, half-coquette; her small, trim figure had just that happy degree of compression which gives slightness without stiffness. Her face, I thought at the first moment, young and fresh as it was, was hard; it had a metallic sharpness and clearness, the very reverse of the soft, dreamy, veiled charm of young English beauty. She wore a smile, not soft or timid indeed, but full of a gay, conquering brilliant sweetness of its own.

Hermine was very gracious to me. Had she met me in the street as a stranger, she would most likely have measured me with the eye of quick, unsparing criticism, which, in a moment, takes in the whole figure and dress, and which not a spot, a wrinkle, or a fold of it, if the fashion, escaped; and then turned away with that slight derisive smile, so singularly calculated to disconcert or provoke an Englishwoman. But now, perhaps Hermine satisfied herself in that glance that my pretensions as a rival were not formidable, my gown and bonnet having obviously not been made in Paris. At any rate, coming up to me, graceful and self-possessed, she made her felicitations with a tone of affectionate interest, in her light, ringing, singing voice, and that air, so winningly *empressé*, which attracts, flatters, and caresses to the highest degree. A pretty Frenchwoman, who means to please, knows how to manage the briefest meeting, the slightest chance-intercourse, especially with the other sex—be it only a handing from a *voiture*, a making way in the street, and with but a bow, a smile, a 'Merci, monsieur,' so as to turn it all into a little sentimental passage; and this charming manner they all have, more or less, from the high-bred young countess to the poor fruit-woman at her stall.

Hermine and I exchanged a few light sentences; I making crude efforts to rival her manners, to smooth and refine my phrases as prettily as I could, instead of trusting only to my downright *sans façon* English good-will, which was quite put to shame by her exquisitely polished conventionalities, and all this in a language of which not a word came straight to my tongue when I wanted it. Sybil soon relievingly interposed that it was time to dress for Madame Gibbs. We withdrew together, leaving Hermine and her mother, who were prepared to accompany us.

'Will you put me up a little to these soirees?' I asked of my sister; 'you know I have lived so long in a lonely corner of Cumberland, I shall feel giddy at this sudden plunge into Paris life, and disgrace you by my blunders.'

'Oh, these people are so indulgent,' said Sybil: 'they regard a foreigner's first crudities as charming and piquant novelties: to the newly arrived, all things are forgiven. I will tell you the sort of thing. One evening in every week, a lady receives company; and her acquaintance, if once they have had an invitation, are expected always to come that evening. They come, however, or not, as they like; the party is large or small, as may happen; they dress as they please; they come in and go out with no ceremony beyond just that of greeting their hostess; they stay long, if they find it amusing, or only a few minutes, if it is not so, or if they want to go elsewhere. The same people get a habit of frequenting the same places; so that one very often becomes intimate with a person whose family, or even name, one scarcely knows, and perhaps never sees by daylight, from meeting him or her two or three times a week, which, as mutual acquaintance have also their evenings, will often happen. So you see there is no effort, no *gêne*. People here meet to talk, and that with all their hearts. There is always the pleasant expectation of meeting there again any one who has begun to interest you, and the certainty of new faces, and of watching foreign and amusing ways.'

'Well, I like that,' I said; 'if only I need not talk a word the first three evenings.'

I did not know my fate; or rather, I did not know myself.

'I shall name no one to you beforehand,' said Sybil; 'it is so much more amusing to find out for one's self, except Emile de Fleury, who is a sort of relation: he is Hermine's cousin; has lately left the Ecole Polytechnique, and is in the army.'

Our voiture rumbles and jumbles along the execrable *pavés* of the aristocratic Faubourg St Germain, which is also the literary quarter, the colleges being chiefly there, and in this class of society lay our present acquaintance.

We stop at a large old dingy-looking house, in the Rue de l'Université, once the handsome hôtel of some grand seigneur, whose various floors are now filled with artists, students, and full-grown *littérateurs*. The *porte cochère* is open; we drive through into the paved open court, where several carriages are already standing. Three flights of stairs lead to the apartment of Madame Gibbs; we are ushered into a nice little ante-room, where an open stove or brasier, with its white marble top, diffused a delicious warmth, in compensation for the starry frozen bitterness without. Two smiling maids took charge of the ladies' mantles, *cachemires*, *capotes*, and all the rich winter-wrappings that shroud till then the still more elegant evening-dress within. The light chorus of voices from within reached the ante-chamber, and in a few moments we were amongst them.

Madame Gibbs had just re-commenced her weekly soirées. These were of a kind very frequent among the lettered, artistic, professional, and generally not very rich or exclusively fashionable circles in Paris, consequently, very mixed, very easy, and very agreeable. There was no show, expense, or elaborate hospitality of any kind; the greater part of the guests having long been in the habit of attending, were as much at home there as by their own firesides. Besides this regular and natural re-union of intimates, Madame Gibbs—being a brisk and vigorous society-lover—was at some pains to flavour it with a spicy ingredient or two—a new arrival, a foreign celebrity, a queer character, a known talker, who either became permanently added to her set, or just lighted it up for the winter, or perhaps the evening, like a passing meteor. As yet, the season for gaieties, for balls, and fêtes, had not begun; the full flood of strangers has not poured in; as yet, therefore, these soirées have more of a quiet domestic character; the *parqueté*

dancing-room is not made use of, except by an *impromptu*. The ladies' dresses are simply *demi-toilettes*—the *corsage montant* not yet replaced by the *décolleté*. The young ones bring their fresh clear tints of pink and white, unworn by a long Paris campaign; there are plenty of happy idle men, the Chamber of Deputies not having yet opened, nor the college-lectures begun. The rooms of this apartment are not large, but they are pretty ones—well arranged for receptions, well furnished, and well lighted. They consist of two salons, just of the right sociable size and shape, each warm and cheerful, with a sparkling wood-fire in each, and couches and fauteuils scattered round in most inviting groups.

The rooms are gradually filling, but the full choir of conversation is not begun. People stand, flit about unfixedly, exchange a word here and there, presenting those who wish to meet, find each other out, choose their places, and fall into a happy cleft of talk, either in a duet, or a group of three and four, changing as people leave or join it. Ere long the salon seems to present nothing but a crowd of black-bearded moustached men, whose white gloves are all waving eagerly through the room, and their tongues incessantly going betwixt talk and laughter. All are voluble, easy, self-possessed, and seem in high enjoyment, except here and there an insular form, rising like a column above the rest, blonde-headed, reddish whiskered, heavy, good-looking, either silent or speaking quietly, perhaps with an air of *gêne*, and with looks and attitudes anything but at ease. Besides these there are very bearded artists, professors with *lorgnons*, a few *militaires*, some serious-looking Italian exiles, some half un-nationalised travellers—citizens of all worlds, and many of them queer ones—some suspected Jesuits, with smooth smiles, softly joining every lively group of talkers, listening and seeming as lively as any. Here and there is a stray grand *seigneur* of the old school, known by his more quiet polished manners—generally a zealous Catholic, *dévo*t without morality, and a chivalrous legitimist, doomed thus to *coudoyer* red republicans of the most emancipated creed; and finally, as large an element as any, fair bright English girls, often habituées of Paris, but national all over in speech, look, and dress, and evidently, in their fresh beauty and joyous simplicity, great favourites with these *causerie*-loving messieurs. French demoiselles make a very thin sprinkling; and when they do appear, it must be owned their countrymen neglect them a little.

There sits a knot of right English maidens—a bouquet of two or three of these island lilies or northern roses—and every now and then a lively-looking Frenchman slides up to them, hat in hand, and, with a smile, makes two bows, the first at a distance, reverential; the second near, *empressé*—however intimate, hands are never shaken—and after a most polite inquiry as to the health of the young lady he has singled out—which must be answered, as he will repeat it till it is—he opens at once an animated flirtation. The mixture of lively badinage with compliment only *implied*, the appearance of interest, the pretty turns of speech, shewing just enough consciousness of their different sexes, and not too much, the readiness to listen as well as to talk, and the open-hearted, confiding frankness with which he communicates for her sympathy his feelings, his cares, or his sorrows—all strike the young English mind as very un-English indeed.

The favourite beginning topic is a laughing rallery of mademoiselle on her *préjugés atroces* against his nation, which he either playfully deprecates or exaggeratedly confirms; and meanwhile, the English girl—if she be new and inexperienced—looks on the Frenchman with a sort of doubt, suspicion, and yet curiosity; he is a mystery of which she finds the study far from disagreeable. Theoretically, she has a

horror of him, as something wicked, worthless, dangerous; yet, while drawn on by him to express this, she finds her real actual feelings to be those of surprise, amusement, interest, and, above all, that delicious one of gently gratified vanity. For the benefit of such innocent English girls, I may observe that this way of talking and style of manners is with a Frenchman a mere matter of course, and means very little indeed. Of course, my initiation into French society was somewhat on this wise, but I missed a good many of the favourite personalities, from the fact of my not being precisely the *blonde et candide Anglaise* which seems stereotyped in their imaginations. In fact, I was not in person of the peculiar English type (to use their pet word), though I soon discovered that I was to them most abundantly *britannique* in character and *manière d'être*. I could, after a while, perceive, not indistinctly, that I was somewhat of a favourite, and that I owed this solely to Sybil's extreme popularity. There would come up to me one after another, either led by Madame Gibbs or by the strong spirit within, to inquire, in tender tones, if I was not 'La sœur de cette charmante Madame de F—'; and very good they were to endure my sins of grammar and absurdities of pronunciation for her sake.

So I sat by Sybil's side, and watched her innocent, delicate gaiety in the light passages of talk she had with divers kinds of people, her pretty caressing attentions to her female friends, her manners, so carelessly serene to the gentlemen, old and young, who came up to her. I had, as I said, my share of introductions; for some time, it was a quick desultory succession of indifferent persons. I scarcely caught a name, I hardly knew one face from another—all was equally strange, as Englishmen often wild, and bearded like a foreigner, a foreigner sometimes speaking excellent English.

Before long, there came up to Sybil a young man, who at once detached himself to my eye from the crowd of similitudes, and who was named by her as M. Emile. He had decidedly a military air; but the first thing that struck me was his superiority in height, figure, carriage, and style of face to almost all the other young men. I had not then learned to distinguish at once a 'meridional' from a true Parisian, or son of the north, and did not know how characteristic of M. Emile's half-Spanish race was the tall, slender form, the superb curl and splendid black of his hair, beard, and silky small moustache, the pale olive hue of the south relieved by the softness of the expression, and the depth of the large black eyes. He approached Sybil quietly, with an air of homage almost timid, yet very sweet; then, on being introduced, bowed and addressed me with a kind of gentle formality; but I noticed in him, as indeed in most Frenchmen, an ease and propriety of attitude which *gaucherie* or nonchalance too often hinders an Englishman from attaining. A Frenchman presents himself well, and stands or sits straight and at rest—all but his gesticulating hands: his bow and his smile, without being expressed, have the air of one who means to please and be pleased. In the case of M. Emile, the gentleness with which he entered into conversation, formed a kind of shelter from the exuberant, noisy vivacity of the others, and I soon found myself pleasantly floating along a stream of metaphysical, critical, sentimental, and other discourse with the intelligent young *militaire*. He talked well, like other Frenchmen; but though his smile was ready and sweet, and his remarks often playful, he yet seemed to me subdued in comparison with the others; and I took occasion of a break in our conversation, to ask my sister if the young officer's heart had been blighted.

'No, I think not,' said Sybil; 'the state of his country, and his own want of hope of rising, tend

to depress him; but you will often see him bold enough.'

This was enough. When M. Emile, with his own quiet perseverance, again found a place by Sybil and me, to make me begin to talk politics, I asked him how he liked his present ruler. He shrugged his shoulders à la Française. 'You think him only better than anarchy?' I persisted, with English directness.

'I am in his service—I must not speak ill of him,' he replied.

I begged pardon for my question *indiscret*, and was politely forgiven. Indeed, a determined *marotte* was not in M. Emile's character—at least, towards one in whom he began to place a friendly confidence; and he ere long developed feelings which made me say: 'I am charmed to find you really a republican.'

'Mais vous êtes la première qui en ayez senti,' he said in a gently injured tone.

Still further emboldened, I affirmed: 'Si j'étais à votre place, je jetterais mon brevet aux quatre vents.'

He pleaded the necessity of a profession, the duties and hope of serving his country in some way or other, which a present surrender of his position would forever destroy—alleged reasons which I felt to be valid, but would not allow. I stood to my text—affirmed, with easy heroism, 'il n'est pas nécessaire de vivre,' and so on, till he was reduced to a smiling, protesting 'mais vraiment, mademoiselle,' then to break off, wondering at such *enthousiasme exalté*—'he had no idea he should find an Anglaise so démocratique,' &c. I liked to see him as he stood smiling down from his tall, . . . under his dark silken moustache, and pleased, amused, half-embarrassed smile, crossing and uncrossing his arms in a light and gentle style of his own, as he entered his protest against my exultation. I was a little displeased with M. Emile for what appeared an absence of heroic consistency—at least a temporary submission to circumstances; but I did him wrong, as his conduct on an after-occasion proved.

It was perhaps fortunate for our nascent friendship that at this juncture there approached a gentleman whom I did not know, a complete contrast to the quiet, thoughtful, low-voiced militaire, and who had been fluttering about, or rather had passed in his erratic flight a moment near us, and then waiting for no introduction, plunged into the conversation, which from that moment he carried on, and almost carried with a torrent of spirits, esprit, badinage, language, and animation of look, tone, and gesture that I repeat of describing. To say that he was amusing is small. I was never in my life so amused before. To say that he was extremely noisy, is also strict justice; and when attracted by the flood of talk and *écarts* of laughter from our group, other gentlemen from time to time joined it, till it consisted of five, six, or even seven at once, contributing their quota to the excitement. I felt myself at last in a *bravade* and fever of amusement, surprise, and *excentric*. Sybil at first gave me some aid, but she was called away by Madame Gibbs, and left to herself, the unfortunate 'étrangère' found her difficulty in speaking become ten times greater. But this moment nothing; the flattering politeness, the inextinguishable conversation and electrical good-humour of the unknown, covered and overpowered all. Encouraged by these vehement talkers, I could not and did not think of escaping, and nothing but my own final departure put an end to the game, which seemed agreeable to these gentlemen, of astonishing the Anglaise. I must say that they were also extremely well-bred, and the quickness and courtesy with which the unknown in particular listened to understood, helped out, and replied to my very English French, was perfectly charming.

As for recording one-tenth of what he said, I

would be impossible; not without the tone and manner would it seem much worth recording; I can only collect some few stray drops from this Niagara of talk. I was first (of course) rallied on my supposed English prejudices against the French, and confirmed in them by the assurance that they were *bavards*, frivolous, foolish, and unreflective: the Gallic cock, said my new friend, was the exact emblem of the national character. Nothing could be more amusing than the way in which they ran themselves down, appealing constantly, in seductive tones, to 'mademoiselle,' for whose edification these tirades were uttered. They talked about national cruelty; their ferocity, especially that of the military, was admitted without a dissentient voice; but some one pronounced the cruelties of the English worse, because they were committed in cold blood, while the French were hurried away by passionate excitement. Finally, of all the excesses of all the most savage soldiery, those committed by the Austrians were said to be pre-eminent. Then the gentle M. Emile was rallied on the ferocity he had brought from one short campaign in Algérie; but to allay the horror I might be feeling for him, I was assured that he was the most humane of all, and that he had not 'égorgé plus d'une douzaine de femmes, ni mangé plus de quatre ou six enfans.' M. Emile then told compositely some stories of horrible massacres and murderous adventures in Algérie; but when he tried to allay the effect by touches of interesting incident or picturesque descriptions, he was unmercifully laughed at by his friend, who bade me believe nothing he said, for that M. l'officier was 'romanesque, ou peu sentimentale même.' 'You, at any rate, are not,' I thought to myself. It was great fun to see this lively man teasing his friend, and then consoling him with a patronising, caressing good-nature, all of which the militaire took with his usual amiable serenity. From foreign they came home to domestic cruelties, which they told apparently with great gusto. 'Voilà, mademoiselle, encore le tigre,' was the delighted wind up.

Having thus lighted on politics, we pursued the theme with something more of earnestness than before, and then my new friend, by certain oratorical poses, betrayed himself to be one accustomed to the tribune and to public representation. All Frenchmen, I observe, at all in the habit of public speaking, make a point, when interrupted for but two minutes, of following Lamartine's great example, and standing with their arms folded in an attitude of august calm. My friend's natural majesty was not much, but he did what he could. A pensive Italian joined the group; the sprightly professor—for so far I had made out what he was—instantly turned his fire of railery on him, said something with much emphasis about 'le roi Bomba,' and then turning again to me, said: 'We have one comfort; so long as the Neapolitans exist, we cannot be called the last of nations,' which hit the young democratical littérateur took very well. Then he gaily quoted the president's late reported saying: 'Il faut supprimer l'Angleterre,' and asked me how I liked it. 'Let him try!' I answered scornfully; adding, that it was very ungrateful of him to the country which had sheltered him so long. This remark was politely approved of; and when I was threatened with being detained prisoner at Paris in case of an English war, and answered 'Je resterai volontiers,' smiles and bows acknowledged my reciprocal politeness. When on being asked my political opinions, I confessed 'la rougeur la plus foncée,' and that I was ready to mount a barricade, M. le Professeur, with an air of most chivalrous gallantry, declared his determination 'de la monter derrière moi.' A general shout of laughter informed him of his mistake, and it was in vain that he

earnestly strove to improve it to 'devant vous;' he got nothing but the credit of the first assertion.

In the course of the conversation on various subjects, the Italian littérateur, with a placidly professorial expression and in a tone of the mildest inquiry, suddenly asked: 'Quelle est la plus belle mort dont parle l'histoire?' This produced several instances, none of which I thought perfect, chiefly on account of their public, and even ostentatious character, and brought forward the negro slave in the wreck, who gave up his place in the life-boat to his master's two little sons. When I had begun this story, I became aware how little competent I was to bring it to a conclusion, and heartily wished I had never thought of it; but my hesitating narrative was received with as much silent, courteous, apparently interested attention, as if it had been *le plus beau morceau d'éloquence au monde*. I was sorry when Sybil summoned me away.

A PLEA FOR THE EYES.

THE eye of the workman is assuredly one of the choicest of his working-tools—the one, indeed, most deserving to be cherished and protected; and yet how great and prevalent is the carelessness regarding this exquisite instrument! Men in after-life have too often to pay dearly for not minding their eyes in their early days. It is eminently proper that the Society of Arts, after a hundred years of usefulness, should take up this matter; seeing that few greater contributions could be made towards the advancement of arts and manufactures, than a set of practical, sensible suggestions tending to the preservation of eyesight on the part of those who are engaged in industrial avocations. Some time ago, the Society appointed a 'Committee on Industrial Pathology on Trades which affect the Eyes,' consisting of Dr T. K. Chambers, Mr Simon, and Mr Twining. The course which this body pursued was, to send a circular of printed queries to all classes of persons, in all parts of the kingdom, who appeared likely to afford useful information on the subject under consideration. Some of the persons thus applied to made no response; while others dilated upon irrelevant matter—sending, in fact, a streamlet of text in a meadow of margin. Much valuable detail, nevertheless, was forwarded; and the committee made a report to the Society, embodying the chief facts laid before them. By condensing these facts, and throwing them into a different order, it may be possible to render the general bearings of the subject easily intelligible.

The inquiry separates itself into two parts: what eye maladies are incident to particular trades? what eye maladies are due rather to injudicious management than to the exigencies of the worker's employment?

In relation to the first question, there are undoubtedly numerous trades that seriously affect the eyesight. Artisans occupied at furnaces, such as smelters, glass-blowers, and assayers, suffer in the eyes from excess of light; and it is difficult to see how this can be remedied; for the use of any kind of tinted spectacles that would modify the glare, would at the same time interfere with the workman's power of ascertaining when the glass or metal had arrived at its proper state of fusion—a point mainly to be determined by the intensity of light emitted from the molten substance. Chips of metal frequently cause injury to the eyes of metal-turners, fitters, hammermen, cutlers, and others, either by striking against the eyeball, actually entering the eye, or burning it when the particles are red-hot. Sparks are often very disastrous to foundry-men and blacksmiths, sometimes burying themselves in the very substance of the cornea, whence they have to be picked out. Chips of stone are sources of much eye-injury to

quarrymen, masons, stone-carvers, and stone-breakers. If the material be sandstone, the injury is less severe, because the stone can be worked without much force, and the particles have no keenly cutting edges; but granite is sadly disastrous, since the sharp fragments of this stone will cut into the eye as forcibly as chips of metal; and the like may be said of particles of flint. Coke-grit is a modern but not less mischievous cause of injury; railway-guards, and passengers in open third-class pleasure-trains, are much exposed to the attacks of sharp angular particles of coke, blown out by the strong blast of the engine; these particles, whether impacted in the cornea, or driven under the eyelid, of course occasion much inflammation. Formidable injuries are inflicted on the sight of masons, bricklayers, hodmen, plasterers, and lime-burners by particles of lime, especially if the lime be in a caustic state. Miners, firework-makers, rock-blasters, quarrymen, and gunpowder-makers are, from the very nature of their several employments, exposed to imminent peril of the destruction of eyesight by explosion; and particles of powder are also likely to be driven into or against the eye. Millers, chimney-sweepers, mortar-mixers, dustmen, and drug-grinders are constantly exposed to the irritating influence of small particles of dust upon the eyes. The fork-grinders of Sheffield, and, to a less degree, the needle-grinders of Redditch, are, in like manner, affected injuriously by steel-dust. In the clothing districts, many of the workers in wool, cotton, and flax are frequently liable to the intrusion of small fibrous particles under the eyelids; and the same may be said of feather-workers and fur-workers. Soda-water bottling is a perilous employment, seeing that the fragments of bottles that have burst, and corks that are forcibly driven out, are frequent sources of lamentable injury to the eyes. Engineers are sometimes placed on the sick-list, not merely by the attacks of small particles of metal on the eyes, but by the injurious influence of blasts of steam. When the finishers or gilders employed by bookbinders were accustomed to heat their embossing-irons by charcoal-stoves, the eyes suffered much from the fumes; but this evil has been lessened by a partial use of gas-stoves. Book-finishers and gold-beaters are not unfrequently observed to be near-sighted, an effect supposed to be caused by the yellow glare to which they are so constantly exposed.

Notwithstanding the length of this melancholy list, it is satisfactory to learn that by far the larger number of eye injuries are due to causes not necessarily attaching to particular trades, but are susceptible of improvement, if not absolute removal. These causes are numerous, as we shall presently see.

One cause is *overwork*. Mr White Cooper, surgeon to St Mary's Hospital, said in reply to the queries of the committee: 'Injuries bear but a small proportion to the enormous number of cases of overwork of the eyes, varying in degree from slight derangement to absolute blindness, but all interfering more or less with the due use of the organs of vision.' With the same opportunities of observation, Mr Dixon, surgeon to the London Ophthalmic Hospital, stated that a large proportion of patients who apply at that establishment, on account of what they term 'weakness of sight,' owe the defect to mere over-use of the eyes. 'I mention over-use rather than any special trade,' he says, 'as the exciting cause; for every day's experience teaches us that needlework, and other occupations requiring close attention to minute objects, may be followed without injury to vision. Tailors suffer much from this over-use; they frequently make long days of work; they are sewing black materials for many hours consecutively; their constrained posture causes congestion about the eyes; and the want of fresh air in their heated workrooms renders them susceptible to "catarrhal ophthalmia" when they go into the open air.

The same may, to a considerable extent, be said of dressmakers and needlewomen. The Royal London Ophthalmic Hospital includes always among its patients a large number of Spitalfields weavers, whose eyes become injured by long hours of work and insufficient exercise. The copying-clerks employed by law-stationers suffer much in eyesight through the long hours of night-work to which they are frequently subject during the sittings of parliament and of the law-courts. Lacemakers are found to suffer in sight, not only from the long-continued work necessary to furnish them with the means of subsistence, but also from the constrained position in which they bend over their cushions. A like observation applies to the lacemakers employed by the bobbin-net manufacturers at Nottingham. Mr White Cooper states: 'The number of persons in this metropolis who suffer from overwork of the eyes is very great. On referring to my records, I find that 1820 such cases came under my notice in nine years, the large majority being tailors, shoemakers, and female workers with the needle. . . . I have been repeatedly told by milliners that twelve, fourteen, or sixteen hours a day, was the ordinary duration of their labour, and this often in foul and badly ventilated apartments. Milliners and tailors are especially liable to suffer from extraordinary demands upon their powers of endurance; a large amount of work is required to be completed within a limited time; this involves the loss of sleep and close confinement in an atmosphere loaded with impurities, and heated to an exhausting extent.'

Another cause is *excess of light*. In large tailoring and dressmaking establishments, where many persons work in one room, much irritation of the eyesight arises from that superabundance of light which gas can be made to afford. Watchmakers and engravers are subject to premature exhaustion of the visual powers; for they are not only necessitated to throw a strong artificial light on their work during the long winter evenings, but they even concentrate the rays by magnifiers. Sailors often suffer from excess of sunlight, as do likewise harvesters and haymakers. Blacksmiths, cooks, and engineers are among those whose eyesight is troubled by excess of furnace-light. Mr France, lecturer on ophthalmic surgery at Guy's Hospital, adverts to a curious kind of superabundant light which would not have occurred to many besides oculists. 'If the Society of Arts,' he says, 'would exert its influence with the public to abolish the present custom of decorating shop-fronts with broad plates of brass, they would effect an important oculosanitary improvement: these brazen mirrors, when in summer weather the sunshine is perfectly reflected from them, are in truth a very serious evil to the vision of passers-by.'

A third cause is *deficiency of light*. Those tailors and sempstresses who work in large establishments, as has been said above, liable to irritation of the eye from excess of gaslight; but those who work at home too often suffer from deficiency of light; their windows are darkened by contiguous buildings, while a small cheap candle affords insufficient light in the evening. There appears to be a custom among dressmakers of making up their white and coloured materials during the day, and reserving black work for the evening, on the ground that white or delicate fabrics are apt to become soiled by the smoke of artificial light. The reason assigned may or may not be a sound one; but the practical effect is that of fatiguing the eye by evening-work upon a substance which, by the very circumstance of its being black, reflects little light to the eye. Nothing can tell more conclusively on this point than a few words used by Mr White Cooper: 'I have invariably found that a general mourning increased the number of applicants for relief at the ophthalmic institutions to which I am attached'—

owing to the blank, dreary, wearing and wearying obscurity of the light from black work. Fine work has some such effect as dark work upon the sight; for the eye aches in the endeavour to appreciate each minute spot on the work to be done. Engravers frequently suffer from this cause. The 'closers,' 'statchers,' and 'stabbers' of boots and shoes are in like manner troubled in eyesight by the closeness of the stitches to be made.

A fourth cause is *badly applied light*. The light by which a worker pursues his avocations may be neither too great nor too small in actual amount; yet there may be a want of tact in its adjustment sufficient to irritate and injure the eye. Wherever a draught of air gives a flickering motion to a flame, the eye becomes thereby irritated and inflamed; and in some printing-offices where the compositors are employed during long night-hours, this evil is said to be much felt. The colour of the light is often a subject of injury. Mr Cousins, one of those from whom the committee sought information, said: 'Needlewomen, embroiderers, and lacemakers should work in rooms hung with green, and having green blinds and curtains to the windows. When in North China, I became convinced of the very great advantage with which this rule has been adopted by the exquisite embroiderers of that part. Their books of patterns are frequently called *Books of the Lady of the Green Window*.' He further remarks: 'Needlewomen would find great advantage in changing the colour of their work as frequently as possible; the rationale of this is found in the law, that variation of stimulus is necessary to preserve the tone and health of any organ of sense, and that prolonged application of the same stimulus exhausts it.' The ill effect experienced through remaining many hours in a room lighted by several jets of gas, is probably due quite as largely to the exhalation of the gas as to the brightness of the light. Much unnecessary suffering, too, is borne by persons who work with a light at too low a level; in full many a case, ease would be found to result from an adjustment of the light at a higher level, such as to allow, as in nature, the brow and lashes to shelter the pupil and iris, and to prevent the impact of direct rays upon the optic nerve.

There are multitudes of minor causes of injury to sight, arising, in great part, from the recklessness of workmen while engaged at their employments. Mr Devlin, a bootmaker, who has written much and excellently both on the social and on the technical characteristics of his trade, drew the attention of the committee to the fact, that shoe and boot makers often ruin their sight by smoking short pipes while bending over their work. The bowl of the pipe, hour after hour, is sending out its fumes within a few inches of the down-turned eyes. 'A shoemaker,' he narrates, 'a voracious smoker, having been compelled to apply, through the failure of his sight, to the celebrated oculist, Dr (Mr?) Alexander, this gentleman, immediately he held the head of the wretched sufferer before his observation, exclaimed: "Why, you have brought this all upon yourself! You are your own eye-destroyer! That short pipe which you stick in your lips is doing it all! Throw that bad and filthy thing aside. There can be no remedy for you until you drop this vile propensity. Why, man, you are burning your very eyeballs out of their sockets!" So he told him, and then and afterwards he did what he could for his patient; but all unavailing as regarded a complete restoration of sight; and now, in his visual benightedness, he is compelled to sell matches in the streets of London.'

Now, in collecting all this sad calamity of eye misfortunes, the Society of Arts, of course, had something more in view than to excite commiseration. The primary objects have been, to ascertain the value of all existing

means of prevention, and to suggest others for future adoption. These means must necessarily depend on the nature of the employment. All artisans who are exposed to eye injury from chips, splinters, dust, grit, or fluff, would do well to look about them for eye-protectors. 'Goggles,' or spectacles of wire-gauze, might often be used with advantage by such persons; and, indeed, stone-breakers in Germany are said to use such. The grinders at Messrs Rodgers' cutlery-works at Sheffield wear, many of them, very large spectacles of plain flint-glass. Dr Gibb expressed to the committee the following opinion on the great 'beard' question: 'I am quite certain that many, in fact a large number of artisans, who are exposed to the influence of dust, grit, chips, splinters, &c., from the nature of their occupation, suffer more in proportion to the absence of beards and whiskers, than those who possess those appendages. This is a fact which is becoming established every day. I have followed this observation out to some extent in practice, in the treatment of diseased eyes from dust, &c., with shaven faces, where there appeared, at the same time, to be a weakness in the organ of vision from the latter cause. On the growth of the beard, when the affection of the eyes was cured, the weakness disappeared, and many whose eyes were before diseased through the nature of their occupations, after obtaining beard and whiskers, were to a great extent exempt from a return of their eye affections. This may be attributable to two causes: the first, the protection afforded to the face by the hair, the strengthening and tonic influence imparted in consequence to the nerves of the face and eyes, and the general improvement of the health from the comfort experienced in wearing the beard; the second, the arrest of the particles of dust and grit by the hair of the beard and whiskers, thereby relieving the eyes. Without at all going into the question as to the propriety of wearing the beard and whiskers, I mention these facts as likely to prove useful, in reply to some of the questions in the special memorandum; but I will observe, in conclusion, that there is a great deal of sympathy between the beard and the eyes, and an abundance of evidence could be brought forward to prove it.'

Many workmen are exposed to the sudden entrance of small particles between the eyeball and the upper lid: a careful laving or bathing of the eye seems the best cure here; and Mr White Cooper has devised an ingenious little contrivance for this purpose, to be fitted up in workshops. In the numerous cases where the light which falls upon the workman's eye or upon his work is either too great or badly arranged, many preventives have been partially adopted, and others suggested—such as due caution against overworking the eye at one time; frequent changes, if possible, in the size and colour of the substances worked upon; avoidance of black work, if practicable, by artificial light; the employment of slightly tinted blue glass-shades, or judiciously arranged paper-shades, in front of gas-jets; a substitution of daylight for nightlight in all employments, so far as the usages of modern society and the necessities of the workers will permit; the avoidance of red or warm colours, and the substitution of green or blue, in avocations wherein the eyesight is much employed; the use of a reflector over a gaslight, to throw down the illumination on the work, and shield it from the eyes of the workman, &c. Mr White Cooper, when speaking of eye-shades, observes: 'The ordinary shades have had the objection of heating the forehead and eyes, by not allowing the escape of vapour from them. An optician has, at my suggestion, made a shade working on hinges, which does away with the objection by allowing of ventilation; and it can also be adjusted at any angle most convenient to the wearer.'

As to injuries to the eyesight resulting from excessive

smoking, snuff-taking, drinking, or excesses in any habit whatever, nothing need be urged concerning the best mode of prevention—to name the indulgence is, at the same time, to name the direction in which reform is to be sought.

This sheet will fall into the hands of many whose daily employments call for much exercise of eyesight; and if it should induce them to attend to the various modes in which the eyes may suffer, or to adopt any suggested preventives, or to suggest preventives for the use of others, the purpose for which this article is written will have been well attained.

PRIZE OR NO PRIZE.

I WAS at the Cape, on sick leave. When I sailed from India, I was as languid and yellow-visaged as the most listless nabob that ever supplied material for farce or novel. A smart bout of jungle-fever makes one see the world and all its advantages through a diminishing lens; and when I crawled from the Masoolah boat up the side-ladder of the good ship *Mary Jane*, I should not have been in the least excited by the news of my appointment to the office of governor-general. But a few months at the Cape, where the dry air and pure skies absolutely seem to impart vitality to an enfeebled frame, made a wonderful difference in me, both mentally and corporeally. As my strength and appetite returned, so did my interest in sublunary matters; and now that I was a convalescent, I became a victim to boredom. There are few places in which one may enjoy more hearty, honest, solid dulness than at the Cape of Good Hope. No doubt, an English market-town, a cathedral city, a decayed watering-place, are tolerably lifeless, especially in hot summer weather, when dozing dogs have the sunny pavement to themselves, and the blue-bottles that haunt the butcher's shop seem to monopolise all the activity of the place. But Cape Town!—Cape Town on a regular baking-day, before the breeze springs up, may challenge the world to compete with it on the score of monotony.

I was not located in the town itself, but at Simonswald, a little place among the hills, perched at a respectable height above the sea, and whose boarding-houses were full of the recovering, the sick, and the dying, who owed their shattered health to the vampire climate of India. There was no diversion at Simonswald, however, except three: you might stroll up to Constantia Farm, and see the world-famous vineyards, read the newspapers over and over again, or play cards. Now, a newspaper is apt to grow tedious by the time of its fourth perusal; and vineyards have a sameness about them; and of card-playing and its effects, I had seen rather more than enough in the hill-stations in India. By the by, I have known men who had withstood all temptation to become gamblers while on service, gradually imbibe a morbid love of high play at the Cape, from pure dearth of employment, and ruin themselves for life to save a yawn. Well, to escape the dulness of Simonswald, I ordered my hack every day at the same hour, and rode to plunge into the dulness of Cape Town. Not that Cape Town is so utterly uninteresting to a stranger; for a short time—say a week—one might be agreeably enough employed in looking about one.

The Cape has its lions, figuratively, at least, on the hither side of the Orange River. There are the Cape pigeons, bolder than any pigeons Europe can produce; albatrosses and cormorants, and other great white or gray birds, perpetually screaming and soaring over the waves that sparkle with gamboling fish. There are the plump Cape belles; the Cape sheep with their astounding tails, which, somehow, never seem real honest appendages, but have all the air of artificial

beside whom most of the visitors to the colony look contemptible pigmies, an opinion you may generally read pretty legibly on the broad face of the Afriander himself. And there are the Hottentots, of whose vicinity, if they should happen to be to windward, you cannot long remain unconscious; and the wonderful wagons from the interior; and the Cape burghers, and the Cape sharks, and the vats of Cape wine, and the miserable booths where Cape brandy inspires a company of negroes to dance to the music of a gourd fiddle; and more cattle, more hides, more clay-pipes, and more queer costumes than would give a travelling artist materials for fifty sketches. But still, in a month or two, a man is sure to grow weary of the Cape of Good Hope, and think the best hope he could cherish would be to get well away from it.

One day, as I was yawning about on the pier, looking up now and then at Table Mountain, to see if the cloth was spread, and any elemental frolic probable, a salute was suddenly banged out by the Flagstaff Battery. As quickly as was natural to a man who, for the last day or two, had had no pleasanter problem to busy his mind than an attempt to solve the question, *why* Cape horses cannot trot, but must gallop or canter, I spun round, and asked for information.

'A king's ship, sir, with a prize in tow—a slaver, belike,' said a seafaring man, the mate of some merchantman, and very civilly handed me his glass, through which I could make out a frigate 'clawing' into the bay, in company with a large suspicious-looking black brig. Meanwhile, signals were being rapidly exchanged between the frigate and the shore; and soon the rumour spread that the new-comer was the *Lynx*, 36, Captain Horne. *Lynx*, Captain Horne! here was a chance for me, for Horne was an old friend, a sort of Welsh cousin of mine, and I had even been a cruise in the *Lynx*. Here was a remedy for the Cape blue-devils, for a few days anyhow. I should dine with Horne, and Horne would dine with me, and then I should join the gun-room mess, and hear some yarns not absolutely threadbare. But here is the gig pulling fast for the pier-head, and in the stern-sheets sits the weather-beaten naval commander, Captain Horne, full fig, on his way to the governor's. To my surprise, he seemed in wretched spirits, and winced when I congratulated him on his success in the anti-slavery line.

When he came out of government-house—the 'residence,' as the natives call it—Horne, who had agreed to dine with me, passed his arm through mine.

I asked him what made him wear such a hang-dog look, being lucky enough to have caught a slaver.

'Caught a slaver!' he exclaimed—'caught a Tartar would be nearer the mark, I am afraid. I wish she had been under fifty fathoms of blue water before ever I heard of her.'

A little pressing, and I heard the whole story.

'I was hovering about the South American coast,' said Horne, 'keeping a bright look-out for any stray Brazilian that might be fitting for a trip to the slave-coast; but not one could I find. Either the craft were invisible, or the negro-trade was a myth, one would have thought. At last—you know I always paid highly for good information, and picked up more prizes in that way than could otherwise have been gained—at last, I was informed that a brig was fitting out in Buenos Ayres harbour, and would sail shortly. She was under Brazilian colours, but the skipper was a Yankee, and a 'cute' one. He had been obliged to take on board a suspicious quantity of water-casks, salt provisions, and so forth, but he had hidden the shackles—Old Nick alone can tell where; and on the slave-deck he had placed six horses, in pens, as a pretext for his voyage. Ship's papers, man-

honest trader, don't you see? carrying on a traffic in horses, though I shall be able to prove that for the six hide-bound old screws he took out, he must have paid more in Buenos Ayres than he could possibly sell them for on the African coast. Besides these nags, the Yankee had a cargo of hardware, guns, nails, tools, metal rods—the proper things to barter with the natives—and he was to bring back produce, so he says.

'Well,' he sailed. I kept a bright look-out, and never lost sight of his topmasts during the voyage.

'His course was evidently towards the Bight of Benin; but when he got within eighty miles of the Guinea Coast, the old fox doubled, and ran down in the night towards Cameroons. The brig sails fast, as slavers always do; but the *Lynx* is the tightest, trimmest little boat on a wind, in the whole'—

'There, there, Horne; I know all that.'

'Well,' resumed Horne, 'I was coming up with him, hand over hand, so round he went; and running round some sandy keys, made for the Calabar River. I gave chase, and he then steered for the Bonny. This would never do; a squall, a fog, even a dark night, and he would escape me, and carry his cargo of ebony safe to America. So I ran down, fired a gun, and sent a boat to fetch the skipper. He met me with a provoking grin, and said, as he squirted tobacco-juice over my clean white decks: "Well, cap'n, you've got me, and I hope you like me. You've captured me, I guess; but to get the brig condemned is another and a nation different story." And so it is, Ned, and I'm afraid I've only burned my fingers by my precious caption. The mixed court won't condemn her on bare suspicion. The crew are as close as wax, and the Yankees keep watch on the Spanish sailors, so no one can split if he wanted to.'

'And if you don't get her condemned, Horne?' said I.

'If I don't, I'm a ruined man, that's all,' he returned with a quiver in his lip very unusual to him. 'I'm a poor man, as you know; and if my prospects are blighted, what is to become of my wife and my poor boys? It was for their sake I was so anxious for more prize-money, and I thought this ship would have paid for James's three years at Cambridge, and left a handsome nest-egg in the bank too. But if the brig's declared an honest trader, I must pay compensation for seizing her, and detaining her illegally, and dockyard-men, labourers for the search, fees, wages, and what not, until I'm a beggar. Worse, too; I shall be in the "black books" of the Admiralty, and perhaps never get another ship, and then'— And the honest fellow stopped, for his heart was too full to allow him to say more. Day after day the slaver lay in Table Bay, and nothing came to light. No seaman peached—no shackles were found. The Yankee skipper grinned triumphantly when he met us on the pier. You would have thought him the captor, and poor dejected Horne the prisoner, to have seen them both.

The mixed court could not come to a decision. There were the water-casks, the salt pork, and so on, but no shackle-bolts and leg-irons. 'Why don't you search the hold?' said I daily to poor Horne.

'I dare not,' was the answer; 'for there is a heavy cargo; and what with the wages of dockyard-men, and compensation to the owners for breaking bulk, the search would cost me a hundred pounds.'

I offered him all the assistance in my power, but he was a proud man, and declined it. So the cause went on, and the naval officer, poor man, was on his trial as well as the rascally slaver. Many a captain has let a negro-trader escape rather than face such a risk. The day of the final trial came, and the Yankee skipper was in court, and snapped his fingers at us. He did not take the trouble to sham innocence, confident he could not be proved guilty. Without

saying a word to Horne, I slipped out of court, ran to the pier, and was pulled on board the brig. I soon secured an ally in the midshipman who commanded the prize-crew, and we made a most irregular onslaught on the contents of the brig's hold. Strange to say, we found the shackles! they had been wrapped in tow, and headed up in casks apparently full of salt-meat; so that, but for an accident, we might have searched till doomsday in vain. But the discovery was useless after all; for when I returned in triumph, I found Horne radiant with joy, and the Yankee crest-fallen and utterly subdued. Unable to agree, the Brazilian and English judges had agreed to *toss up*, heads or tails of a dollar, for condemned or acquitted. Heads came up, and thus, most justly, though by sheer accident, the vessel was condemned.

COOKERY AND COOKS.

We have long been of opinion that not only your poet and your gardener must be 'to the manner born'—overshadowed from the cradle by the flowers of Parnassus or the green-house—but that those very important house-genii, cooks, are likewise so by right of birth-right. To be really a cook, as to be really a poet, one must possess qualities accorded to but few. Quick sense of aromatic odours, equal delicacy of taste in its primary sense, fertility of invention and expedient, powers of combination, must belong to the cook in no ordinary degree. The badness of mere professors of this important art, the skill with which they spoil the good gifts of Providence, are no more arguments against this theory than the detestable infliction of sham poetry is against the heaven-born genius of the poet; nay, it is rather an argument in its favour, the rareness of the gift proving its excellence.

The truth is practically acknowledged by the remuneration of the gift when possessed. One of the late Sybarites of the regent's days gave, we know from certain authority, L.400 a year to her cook; and L.100 a year are the ordinary wages of one who would probably designate himself as an *artiste*.

And like other followers of art, your true cook has an idiosyncrasy of his own: a self-consciousness, a jealousy of non-appreciation, a delight in discovering new combinations of old materials—what else is left to either cook or poet?—and an exultation in casting a glamour over the senses of his duller neighbours by the witchery of his art—an art, too, let us whisper, of much greater importance than we coarse Anglo-Saxons have comprehended till lately, when a great cook became one of the supporters of an army, and made manifest the fact that, as man is an eating animal, he may not with impunity disregard one of the laws of his being.

In ancient times, when man had not learned the evils of indigestion—judging by his length of days and the paucity of physicians—cooking was held in high honour, and practised by noble and princely persons. It is the hands of the queenly Sarah that prepare flesh of the calf and baked cakes for the food of angels. Rebecca's delicate cookery deceived even the practised taste of Isaac, and was the instrument misemployed to bring a prophetic blessing on a peculiar people.

Turn from these great mothers of the ancient race to the Greeks of Homer's days, and you will find kings cooking in honour of their gods; and roast-pork greeting the return of Ulysses. Both the kingly and the swineherd cook develop the idiosyncrasy of which we speak. Important events are celebrated by their art. The sacrifice must be followed by the feast; the royal exile's return, in like manner, by an impromptu slaughter and frying of swine, just as the

poet by a certain instinct celebrates a solemnity or a victory by a lay.

The Spartan cooks, too, even when their art was curbed and checked by the puritanical laws of their country, and their skill was doomed to evaporate in the steam of black broth, were as jealous of their honour as the most tenacious of modern artistes. One has gone down to all ages as reproving a monarch with equal boldness and wit, whilst resenting an insult to his own skill.

The king murmurs over the legal repast of his country—"the broth was naught."

"It lacks its seasoning," was the reply.

"What is that?"

"Labour and exercise, O king."

The cooks of old Rome—we mean of the empire—were obliged to supply by their skill the deficiency of this seasoning. We wonder how many slaves cooked for Lucullus—how they managed their delicate dishes of peacocks' tongues and brains. How pleased the fraternity of cooks must have been at every new creature, "meet for food," which the luxurious conquerors of the world brought back from every vanquished land!—how they must have welcomed the delicious oyster of Britain, the cherries for their first tart, brought home from Greece by Lucullus himself! The days of the Roman Empire must have been a palmy time for cooks. In far-off Egypt, where Antony's capricious appetite taxed the patience and skill of his *chef de cuisine*, twelve cooks constantly prepared the meal that was ever to be ready, and might be called for at all hours; and twelve wild-boars, in different stages of roasting, astonished the stranger's eyes. But we are digressing from the chief purport of our article.

One of the saddest, and yet most apt, illustrations of the jealous sensitiveness of cooks, is that recorded by Madame de Sevigné of the celebrated Vatel, servant to Louis Quatorze. The king was at Chantilly for the day, with all his brilliant court. They walked in those pleasant gardens, and on a spot carpeted with jonquils a collation was served. Roast-meat failed at some of the many tables, for a far greater number of guests had arrived than had been announced in the preparatory orders. Vatel felt the want—the defect in his perfect feast, as his sensitive tribe ever do. He said several times: "Je suis perdu d'honneur; voici un affront que je ne supporterai pas." He added to M. Gourville these touching words, explanatory of the catastrophe which followed: "My head turns; for twelve nights I have not slept; help me to give orders." Gourville helped him to the best of his power, and communicated his distress to the prince, who went to his room, and assured him that all was well; that nothing could be better than the king's supper. He replied: "Monseigneur, votre bonté m'achève; je sais que le rôti a manqué à deux tables." We shall quote the remainder of the sad tale from Madame de Sevigné herself: "At four o'clock in the morning, Vatel walks round the place; he finds everybody asleep; he meets a little purveyor, who brings him only two baskets of salt-water fish. He asks him: "Is that all?" "Yes, sir." The boy did not know that Vatel had sent to all the sea-ports for more. Vatel waits some time; the other purveyors do not arrive. His head grows confused and troubled; he believed there would be no more salt-water fish. He found Gourville, and said to him: "Monsieur, I shall not survive this disgrace." Gourville laughed at him. Vatel ascends to his chamber, puts his sword against the door, and passes it through his heart; but it was only at the third blow—for he gave himself two wounds, which were not mortal—that he fell dead."

Too late, too late came the fish. The grief of the courtiers was great at first, but 'Gourville tried to

repair the loss of Vatel, and it was repaired. The court dined well; they had a collation—a supper; they walked—played. Everything was perfumed by jonquils: everybody was enchanted."

One shudders as one reads. Was there no memory of the unfortunate man who had perished in that sweet perfume? No trace of the recent horror amidst that selfish throng? No marvel if the next time we meet with a royal French cook, it is in the prison of the Temple. The glittering, heartless throng have vanished. The sceptre is in the dust. "Le Roi"—that golden idol—is no longer amid the jonquils of Chantilly, but a captive to his own people; and Turgu, his old cook, faithful amidst so many false, serves, aids, helps the fallen monarch in his hour of need.

The same nervous temperament which led to Vatel's fearful fate, produced in England another tragedy, in which a cook was the principal actor. Some supposed insult offered to his skill, drew the vengeance of this man on the family he served; and they were all poisoned by him. We do not wish to dwell upon such a tale; but as its punishment was the last act of one of our old terrible laws, we could scarcely leave it out in our chat about cooks. In those days, the law condemned 'cooks who were guilty of poisoning to be boiled alive!' and this hideous doom was fulfilled in this case.* The cook was boiled in a large kettle in Smithfield Market! Probably the opportunities of destruction possessed by cooks, suggested fears and suspicions which gave rise to this frightful law, and not any frequency of the crime in the persons for whom it was framed. This opinion is confirmed by the fact that the instance we have cited was the first and last time of the frightful punishment being carried into effect.

But we will turn to a pleasanter phase of character—that is, the skill and art of combination, and even transformation, belonging to this peculiar idiosyncrasy. We suppose almost all our readers know the story of the bet made by the French *gourmands*, one of whom asserted that he could detect the component parts of any dish put before him; the other, betting at great odds that he would not be able to tell the materials wherewith his cook would prepare a 'savoury dish' for them. The bet was taken; the one confident in his quick natural sense; the other in the skill of his cook. The matter was of importance beyond a mere gambling transaction, because the fallen fortunes of a noble family would be raised by the timely pecuniary help. The cook—a Frenchman of course—exerted all his talents, and surpassed all praise. The dish was placed before the knowing epicure. He tastes, smacks his lips, tastes again, smells it—your epicures don't stand on elegance of manner in such a case!—tastes again. Alas! it is redolent of all rich odours; such sauces, so marvelously blended; such gravy, such solids—so soft, tender! What can it be? A wondrously prepared tripe? No! Calves' head in a new shape? No, no, no!—a thousand 'Nos.' Our epicure gives it up. 'It is old white kid gloves!' is the cool explanation, when the bet is resigned up as lost. We remember reading in our childhood, in an old, old history of the Netherlands, of similar skill proving of inestimable value to some Black Walloons, who were besieged and famine-stricken somewhere—our memory cannot recall the name. The cook of the garrison, being a true cook, and therefore possessing the idiosyncrasy of his tribe, made most appetising salads of grass; dressed stinging nettles like spinach with eggs, whilst he had any; made admirable ragouts of rats, and mice, and lapdogs; a splendid second course of dried onions, and finally disguised

* Vide Blackstone's Commentaries.

the officers' old boots à *merville*, and made leather digestible! not to speak of the hot rolls made of saw-dust and a few chestnuts! Finally, the Soyer of that age made his dependents confident that 'if they cut off their left arms, and fought with their right,' he could make wholesome food from the lost members!

The artistic skill of cooks is shewn frequently in ornament as well as in substantial matters. The graceful centre-dishes, and garnishings of sugar, &c.; the vegetable flowers, architectural jellies, the blending of colours, are all proofs of this power. The culinary art appeals to the eye as well as to the palate, and charms three or four senses at once. In the age of chivalry, a fortress of pasty stands, attacked by mimic warriors, on the centre of the baron's board. As taste and knowledge spread, lighter and more fanciful devices appear. Barley-sugar baskets and turrets emulate topazes in clearness and brilliancy, and 'dough' becomes the instrument for the art of a modeller, who might vie with the sculptor, the material taken into consideration.

It was the despair of the Duke of Tuscany's cook for a lacking centre-ornament that brought to light the genius of Canova—the boy, who was lingering about the kitchen—so runs the tale—offering to supply the want, and forming from dough and white sugar so perfect a lion that the duke, perceiving his talent, took him under his own care, and he became the great sculptor of modern times.

Of all people, the negroes are most generally gifted with the skill required for the culinary art. This is shewn, we think, by the choice of a negro for cook on board almost all ships of war. We remember well when we—in our childhood—dwelt on board a man-of-war possessing such a cook; and in how many points our 'Black John' partook of the idiosyncrasy of greater artists; for he was a genius in his way, and delighted in all things beautiful. We can see him now! How he used to strut down the deck, with a certain dignity about him too; there was no lack of self-appreciation in John. How he ordered his subordinates, the boys attached to the galley; and how marvellously quick he was in understanding a 'receipt' for even the most difficult and delicate operations of his art. There was nothing he could not do, though our mother, from some slight prejudice as to his colour—we ourselves thought it was because it would 'come off'—did not permit him to make pastry for us. He liked flowers very much; and in return for some gift of sweets, we presented him with a flower-pot, containing our only flower—a marigold! He was amusingly diverted by the gift, declaring, 'Marigold proper flower for cook, 'cos good to put in soup.' We had even then read a little of Shakespeare, and quoted instantly the verses:

The marigold that goes to bed with the sun,
And with him rises weeping.

Black John was charmed; he made us repeat the lines again and again, till he knew them; and afterwards we heard him, negro-fashion, singing them to a tune of his own—one of those wily melodies which prove how much of the artist's soul dwells often in the bosom of the blackamoor.

But it was—as we said at the commencement of this article—reserved for our own day to shew us the value of cookery as an art, and the idiosyncrasy of cooks in its best form. When our armies were perishing for lack of nourishment rather than food—for they had enough to spoil—a cook, with the self-consciousness of power, and chivalrous feeling peculiar to the character we have tried to draw, volunteered to go and aid the sufferers with the best resources of his skill. He went, and was successful, and raised for ever his art and the skill of its followers in the

estimation of Europe and the East. With the names of the brave men who fought and fell by the shores of the Euxine, will be united hereafter the name and memory of Soyer the cook.

O Ç E O L A :

A ROMANCE.

CHAPTER LXXX.—SIGNAL-SHOTS.

I SHALL not attempt to depict my emotions at that moment; my pen is unequal to the task. Think, thou, of my situation, and fancy them if thou canst.

Behind me, a mother murdered and basely mutilated—a near relative slain in like fashion—my home—my property given to the flames. Before me a sister torn from the maternal embrace, borne ruthlessly along by savage captors—perhaps outraged by their fiendish leader. And he, too, under my eyes, the false perfidious friend—the ravisher—the murderer! Had I not cue for indulging in the wildest emotions?

And wild they were—each moment becoming wilder as I gazed upon the object of my vengeance. They were fast rising beyond my control. My muscles seemed to swell with renewed rage; the blood coursed through my veins like streams of liquid fire.

I almost forgot the situation in which we were. But one thought was in my mind—vengeance. Its object was before me—unconscious of my presence as if he had been asleep—almost within reach of my hand—perfectly within range of my rifle.

I raised the piece to the level of those drooping plumes; I sighted their tips; I knew that the eyes were underneath them; my finger rested against the trigger.

In another instant, that form—in my eyes, hitherto heroic—would have lain lifeless upon the grass; but my comrades forbade the act.

With a quick instinct, Hickman grasped the lock of my gun, covering the nipple with his broad palm; while Weatherford clutched at the barrel. I was no longer master of the piece.

I was angry at the interruption, but only for an instant; a moment's reflection convinced me they had acted right. The old hunter, putting his lips close to my ear, addressed me in an earnest whisper:

'Not yit, Geordie—not yit: for your life, don't make a fuss. 'Twould be no use to kill him. The rest o' the varmints ud be sartin to git off, an' sartin to toat the weemen along wi' 'em. We three ain't enough to stop 'em; we'd only git scalped ourselves. We must slide back for the others, an' then we'll be able to surround 'em: that's the idea—ain't it, Jim?'

Weatherford, fearing to trust his voice, nodded an affirmative.

'Come, then!' added Hickman, in the same low whisper. 'We musn't lose a minute. Let 's git back as rapid as possyble. Keep yur backs low down—genteele, genteele!' and, as he continued giving these injunctions, he faced towards the ground, extended his body to its full length, and crawling off like an alligator, was soon lost behind the trunks of the trees.

Weatherford and I followed in similar fashion, until safe beyond the circle of the firelight, when all three rose erect to our feet.

We stood for a moment listening backward. We

were not without anxiety lest our retreat might have disturbed the camp; but no sounds reached us save those to which we had been listening—the snore of some sleeping savage, the ‘crop-crop’ of the browsing horse, or the stamp of a hoof upon the firm turf.

Satisfied that we had passed away unobserved, we started upon the back-track, which the hunters could now follow like a path well known to them. Dark as it was, we advanced almost in a run, and were progressing rapidly, when our speed was suddenly checked by the report of a gun.

Each halted as if shot in his tracks. Surprise it was that stopped us, for the report came not from the Indian camp, but the opposite direction—that in which our party had been left.

But it could not be one of them who had fired? They were at too great a distance—or should have been—for their guns to have been heard so distinctly. Had they advanced, tired waiting for our return? Were they still advancing? If so, the shot was most imprudent; it would be certain to put the camp on the *qui vive*. What had they fired at? It might have been an accidental discharge—it must have been.

These conjectures were rapid as thoughts can be: we did not communicate them to one another; each had them of himself.

We had scarcely time to speak to one another, when a second shot rang in our ears. It came from the same direction as the former, appearing almost a repetition; and had there been time to re-load, we should have so deemed it. But there had not been time, even for the most accomplished rifleman. Two guns, therefore, had been fired.

My companions were puzzled as well as myself. The firing was inexplicable under any other hypothesis than that some Indians had strayed from their camp, and were making ‘signals of distress.’

We had no time to reflect. We could now hear behind us the camp in full alarm, and we knew it was the shots that had caused it. We heard the shouts of men—the neighing and hurried trampling of horses.

Without pausing longer, we again took to the track, and hastened onward in the direction of our friends.

Farther on, we perceived some men on horseback. Two there appeared to be—though in the darkness we were not certain, as their forms were scarcely distinguishable.

They appeared to retreat as we approached, gliding off like ghosts among the trees. No doubt these were they who had fired the shots; they were just in the direction whence the reports had come, and at the proper distance.

Were they Indians or whites?

Risking the chance of their being our foes, old Hickman hailed them.

We paused to listen. There was no reply—not even an exclamation from either. We could hear, by the hoof-strokes of their horses, that they were hurrying off in a direction altogether different from that either of our friends or foes.

There was something mysterious in the behaviour of these two horsemen. For what purpose had they fired their guns? If to signal the camp, why had they retreated from us as we came forward? Why, moreover, had they gone off in a direction that did not lead to the camp—since its position was now known to them by the noise of the alarm they had themselves occasioned?

To me, their behaviour was inexplicable.

Hickman appeared to have found some clue to it, and the knowledge seemed to produce a singular effect upon him. He exhibited signs of astonishment, mingled with feelings of indignation.

‘Devil swamp ‘em! the wuthless skunks, if’t are them; an’ I’m good as sure it are. I can’t a be

mistaken in the crack o’ them two guns. What ay ye, Jim Weatherford? Di ye reconnoize ‘em!’

‘I war thinkin’ I’d heern them afore—somewhar, but I can’t ‘zactly tell whar. Stay: one on ‘em’s preecious like the ring o’ Ned Spence’s rifle.’

‘Preecious like—it are the same, an’ tother’s Bill Williams. What on airth kin the two be arter? We left ‘em ‘long wi’ the rest, an’ hyar they are—I’m sure it’s them—gallivantin’ about through the woods, an’ firin’ off thar guns to spoil everything we’ve done. They’ve sot the Indiyuns off to a surtisy. Devil swamp ‘em both! what kin they be arter? Some hellniferous game, I ‘spect. By the tarna catawampus! I’ll make both on ‘em pay for this when we git thegither. Come on quick, feller! Let’s git the party up, or we’ll be too late. Them Indiyuns ‘ll make tracks, an’ slope afore we git near ‘em. Durn the shots! they’ve spoilt the hul bismen. Quick—come along hyar!’

Following the old hunter’s direction, we hurried on after him.

CHAPTER LXXXI.

AN EMPTY CAMP.

We had not gone far before we were within earshot of voices, mingled with the hollow thumping of horses’ hoofs.

We recognised the voices as those of our comrades, and hailed them as they came nearer, for we perceived that they were advancing towards us. They had heard the reports; and, believing them to proceed from our rifles, had fancied we were engaged with the Indians, and were now riding up to our aid.

‘Hullo, boys!’ shouted Hickman as they drew near, ‘is Bill Williams an’ Ned Spence among ye? Speak out if ye be.’

There was no reply to this interrogatory; it was succeeded by a dead silence of some seconds’ duration. Evidently the two men were not there, else they would have answered for themselves.

‘Where are they?’ ‘Where have they gone to?’ were the inquiries that passed through the crowd.

‘Ay, whar are they?’ repeated Hickman. ‘Thar not hyar, that’s plain. By the tarna alligator! thar’s some ugly game afoot atween ‘em two fellers. But come, boys! we must forrad. The Indiyuns a jest afore ye. It’s no use creepin’ any more—thar a gwine to slope, an’ ef we don’t git up to ‘em in three shakes o’ a squirrel’s tail, thar won’t be a cussed redskin o’ ‘em on the groun’. Hooraw for scalp! Look to yur guns. Let’s forrad, an’ gie ‘em partickler tarnation!’

And with this emphatic utterance, the old hunter dashed into the front, and led the way towards the camp of the savages.

The men followed, helter-skelter, the horses crowding upon each other’s heels. No strategic method was observed; time was the important consideration, and our aim was to get up to their camp before the Indians could retreat from it. A bold charge into the midst of our enemies—a volley from our guns, with knives and pistols to close the conflict—this was the programme that had been hastily agreed upon.

We had arrived near the camp—within three hundred yards of it. There was no uncertainty as to the direction. The noises from the camp itself, which had continued ever since the first alarm, had served to guide us.

All at once these noises became hushed; no longer reached us, either the voices of men, or the hurried trampling of horses. In the direction of the camp, all was still as death.

We needed no more the guidance of sounds: we were within sight of the fire, or rather of their light, that glittered afar among the trees: with this as our beacon, we continued to advance.

We no longer rode rashly forward. The change from confused noise to perfect silence had been so sudden, so abrupt, as to have the effect of making us more cautious. The very stillness appeared ominous. We read in it a warning; it rendered us suspicious of an ambuscade—the more so, that all had heard of the great talents of the 'red stick chief' for this very mode of attack. We approached, therefore, with greater prudence.

When within a hundred yards of the fires, our party halted. Several dismounted, and advanced on foot. These glided from trunk to trunk till they had reached the edge of the opening, and then came back to report.

The camp was no longer in existence; its occupants were gone; Indians, horses, captives, plunder—all had disappeared from the ground; the fires alone remained! These bore evidence of being disturbed in the confusion of the hasty decampment. The red embers were strewn over the ground, their last flames faintly flickering away.

The scouts continued to advance among the trees, till they had made the full circuit of the opening. For a hundred yards around it, the woods were searched with caution and care, but no enemy was found—no ambuscade. We had arrived too late; our savage foes had escaped us, and carried off their captives from under our very eyes.

It was impossible to follow them in the darkness; and, with mortified spirits, we advanced into the glade, and took possession of the deserted camp—determined to remain there for the rest of the night, and renew the pursuit in the morning.

Our first care was to quench our thirst by the pond, then that of our animals. The fires were next extinguished; and a ring of sentries—consisting of nearly half the number of our party—was placed among the tree-trunks that stood thickly around the opening. The horses were staked over the ground; and this done, the men stretched themselves along the sward, so lately occupied by the bodies of their foemen.

In this wise we awaited the dawning of day.

CHAPTER LXXXII.

A DEAD FOREST.

My comrades, wearied with the long ride, were soon in deep slumber, the sentries only remaining awake. For me was neither rest nor sleep—my misery forbade repose. Most of the night I spent in pacing to and fro around the pond, that lay darkly gleaming in the centre of the open ground.

I fancied I found relief in thus roving about—it seemed to still the agitation of my spirit—it prevented my reflections from becoming too intense.

A new regret occupied my thoughts—I regretted that I had not succeeded in my intention to fire at the chief of the murderers—I regretted I had not killed him on the spot: the monster had escaped, and my sister was now perhaps beyond the power of rescue.

I blamed the hunters for having hindered me. Had they foreseen the result, they might have acted otherwise; but it was beyond human foresight to have anticipated the alarm.

The two men who had caused it were again with us. Their conduct, so singular and mysterious, had given rise to strong suspicions of their loyalty; and their re-appearance—they had joined us while advancing towards the camp—had been hailed with an outburst of angry menace. Some even talked of shooting them out of their saddles; and this threat would most probably have been carried into effect, had the fellows not offered a ready explanation. They alleged that they had separated from the troop before it made its last halt—that they knew nothing of the advance

of the scouts, or that Indians were near—that they had got lost in the woods, and had fired their guns as signals in hopes that we might answer them. They acknowledged having met three men afoot, but they fancied them to be Indians, and had kept out of their way—that afterwards seeing the party near, they had recognised and ridden up to it.

Most of the men were contented with the explanation. What motive, reasoned they, could the two have in giving an alarm to the enemy? Who could suspect them of rank treason?

Not all were satisfied. I heard old Hickman whisper some significant words to his comrade, as he glanced towards the estrays.

'Keep yur eye skinned, Jim, an' watch the skunks well—thar's somethin' not hulsome about 'em.'

As there was no one who could openly accuse them, they were once more admitted into the ranks; and were now among those who were stretched out and sleeping.

The wretches lay close to the edge of the water. In my rounds I passed them repeatedly; and in the sombre darkness I could just distinguish their prostrate forms. I regarded them with strange emotions, for I shared the suspicions of Hickman and Weatherford. I could scarcely doubt that these fellows had strayed off on purpose—that, actuated by some foul motive, they had fired their guns to warn the Indians of the approach of our party.

By midnight there was a moon. There was no cloud to intercept her beams; and after, rising above the tree-tops, she poured down a flood of brilliant light.

The sleepers were awakened by the sudden change. Some rose to their feet, believing it to be day. It was only after glancing up to the heavens they became aware of their mistake.

The noise had put every one on the alert. A few talked of continuing the pursuit by the light of the moon. Such a course would have coincided with my own wishes, but the hunter-guides opposed it. Their reasons were just. In open ground, they could have lifted the trail, but under the timber, the moon's light would not avail them. True, they could have tracked by torchlight, but this would only be to expose us to an ambuscade of the enemy. Even to advance by moonlight would be to subject ourselves to a like danger. Circumstances had changed. The savages now knew we were after them. In a night-march, the pursued have the advantage of the pursuers—even though the numbers be inferior. The darkness gives them every facility of effecting either an attack or escape.

Thus reasoned the guides. No one made opposition to their views, and it was agreed that we should keep the ground till daylight.

It was time to change the sentinels. Those who had slept, now took post; while the relieved guard came in, and flung themselves down to snatch a few hours of rest.

Williams and Spence took their turn with the rest. They were posted on one side of the glade, and next to one another.

Hickman and Weatherford had fulfilled their tour—as they stretched themselves along the grass, I noticed that they had chosen a spot near to where the suspected men had been placed. By the moonlight, they must have had a view of the latter.

Notwithstanding their recumbent attitudes, the hunters did not appear to go to sleep. I observed them at intervals. Their heads were close together, and slightly raised above the ground, as if they were whispering to one another.

As before, I walked round and round. The moonlight enabled me to move more rapidly, and this eased my spirit. Oft-times I made the circuit of the little pond—how oft, it would be difficult to determine. My steps were mechanical. My thoughts had no

connection with the physical exertions I was making, and I took no note of how I progressed.

After a time there came a stillness over my soul. For a short interval, both my griefs and vengeful passions seemed to have departed. I knew the cause. It was a mere psychological phenomenon—one of common occurrence. The nerves that were the organs of the peculiar emotions under which I was suffering, had grown wearied, and refused any longer to vibrate.

I knew it was but a temporary calm—the lull between two billows of the storm—but during its continuance I was sensible to impressions from external objects.

I could not help noticing the singularity of the scene around me. The bright moonlight enabled me to note its features somewhat minutely.

We were inside what by backwoodsmen is technically termed a *glade*—oftener in their idiom a 'gleed'—a small opening in the woods without timber or underwood of any sort. This one was circular—about fifty yards in diameter—and with the peculiarity of having a pond in its midst. The pond, which was only a few yards in circumference, was also a circle, perfectly cocentric with the glade itself. It was one of those singular natural basins found throughout the peninsula, and appearing as if scooped out by mechanic art. It was deeply sunk in the earth, and filled with water till within three feet of its rim. The water was cool and clear, and under the moonbeams, shone with a silvery effulgence.

Of the glade itself, nothing more—except that it was covered with sweet-smelling flowers—that, now crushed under the hoofs of horses, and the heels of men, gave forth a double fragrance.

It was a pretty parterre, and under happier circumstances, I should have esteemed it a picture pleasant to contemplate.

But it was not the picture that occupied my attention at that moment; rather was it the framing.

Around the glade stood tall trees in a ring, as regularly as if they had been planted; and, beyond these, as far as the eye could penetrate the depths of the forest, were others of like size and aspect. The trunks of all were nearly of one thickness—few of them reaching a diameter of two feet, but all rising to the height of many yards without leaf or branch. They grew somewhat densely over the ground, but in daylight the eye might have ranged to a considerable distance through the intervals—for there was no underwood, save the low dwarf palmetto, to interrupt the view. The trunks were straight, and almost cylindrical as palms; and they might have been mistaken for trees of this order, had it not been for their large heads of leaves terminating in a cone-shaped summit.

They were not palms: they were pines—'broom' pines*—a species of tree with which I was perfectly familiar, having ridden many hundreds of miles shaded by the pendant fascicles of their acicular foliage.

The sight of these trees, therefore, would have created no curiosity, had I not noticed in their appearance something peculiar. Instead of the deep green which should have been exhibited by their long drooping leaves, they appeared of a brownish yellow. Was it fancy? or was it the deceptive light of the moon that caused this apparent change in their natural colour?

One or the other, soliloquised I, on first noticing them; but as I continued to gaze, I perceived that I was in error. Neither my own fancy nor the moon's rays were at fault. The foliage was really of the hue it appeared to be. In drawing nearer to them,

I observed that the leaves were withered, though still adhering to the twigs—I noticed, moreover, that the trunks were dry and dead-like—the bark scaled or scaling off—that the trees, in short, were dead.

I now remembered what Hickman had stated while groping for the direction. That was at some distance off; but, as far as I could see, the woods presented the same dun colour. I came to the conclusion that the whole forest was dead.

The inference was correct, and the explanation easy. The sphinx* had been at work. The whole forest was dead.

CHAPTER LXXXIII.

A CIRCULAR CONFLICT.

Strange as it may seem, even in that dread hour these observations had interested me; but while making them, I observed something which gratified me still more. It was the blue dawn that, mingling with the yellower light of the moon, affected the hues of the foliage upon which I was gazing. Morning was about to break.

Others had noticed this at the same instant, and already the sleepers were rising from their dewy couches, and looking to the girths of their saddles.

We were a hungry band, but there was no hope of breakfast, and we prepared to start without it.

The dawn was of only a few minutes' duration; and, as the sky continued to brighten, preparations were made for starting. The sentries were called in—all except four, who were prudently left to the last minute to watch in different directions; the horses were unpicketed, and bridled—they had worn their saddles all night—and the guns of the party were carefully reprimed or capped. Many of my comrades were old campaigners, and every precaution was taken that might influence our success in a conflict. It was expected that before noon we should come up with the savage band, or track it home to its lair. In either case, we should have a fight, and once more all declared their determination to go forward.

A few minutes were spent in arranging the order of our march. It was deemed prudent that some of the more skilled of the men should go forward as scouts on foot, and thoroughly explore the woods in advance of the main body. This would secure us from any sudden attack, in case the enemy had formed an ambuscade. The old hunters were once more to act as trackers, and of course lead the van.

These arrangements were completed, and we were on the point of starting. The men had mounted their horses—the scouts were already entering the edge of the timber; when all on a sudden several shots were heard, and at the same time the alarms of the sentries who had fired them. These had not yet been called in; and the four had discharged their pieces almost simultaneously.

The woods appeared to ring with a hundred echoes. But they were not echoes—they were real reports of rifles and musketry; and the shrill war-cry that accompanied them was easily distinguished above the shouting of our own men.

The Indians were upon us.

Upon us, or, to speak less figuratively, around us. The four sentries had fired, therefore each had seen Indians in his own direction.

But it needed not this to guide us to the conclusion that we were surrounded. From all sides came the fierce

* *Pinus Australis*. One of the most remarkable of the *coniferae*. A true southern species.

* *Sphinx confervarum*. Immense swarms of insects, and especially the larva of the above species, insinuate themselves under the bark of the 'long-leaved' (broom) pine, attack the trunk, and cause the tree to perish in the course of a year. Extensive tracts are met with in Florida, covered solely with dead pines that have been thus destroyed.

yells of the foe, as if echoing one another, and their bullets whistled past us in different directions. Beyond doubt, the glade was encompassed within their lines.

Their first volley had but little effect. Two or three men were hit, and as many horses; but the balls were weak, and did but trifling harm. From where they had fired, our position was beyond the 'carry' of their guns, and spent bullets were seen plashing dead upon the pond. Had they crept a little nearer, before delivering their fire, the execution would have been fearful, clumped together as we were within the opening.

Fortunately, our staunch guards had perceived their approach, and in good time given the alarm.

It had saved us.

These are after-thoughts. At that crisis, no one paused to reflect. The nature of the attack was apparent to all of us; it was a 'surround,' and the best mode of meeting it was our only thought.

There was a momentary confusion with much noise—the shouting of men, mingled with the neighing and prancing of horses; but above the din was heard the guiding voice of Hickman.

'Off o' yer hosses, fellers! an' take to the trees. Down wi' ye, quick! To the trees, an' keep 'em back! or by the tarnal aithquake, every mother's son o' us 'll git sculped! To the trees!—to the trees!'

The same idea had already suggested itself to others; and before the hunter had ceased calling out his directions, the men were out of their saddles, and making for the edge of the timber.

Some ran to one side, some to another—each making for the tree that was nearest him—and in a few seconds our whole party had ensconced itself—the body of each individual sheltered behind the trunk of a pine. In this position, we formed a perfect circle, our backs turned upon each other, and our faces to the foe.

Our horses thus hurriedly abandoned, and wild with the excitement of the attack, galloped madly over the ground, with trailing bridles, and stirrups striking against their flanks. Most of them dashed past us; and, scampering off through the trees, were either caught by the savages, or having broken past them, escaped into the woods beyond.

We made no attempt to 'head' them. The bullets were hurtling past our ears. It would have been certain death to have stepped aside from the trunks that sheltered us.

The advantage of the position we had gained was apparent at a single glance. Fortunate it was that our last sentries had been so tardily relieved. Had these been called in a moment sooner, the surprise would have been complete. The Indians would have advanced to the very edge of the opening, before uttering their war-cry or firing a shot, and we should have been at their mercy. They would have been under cover of the timber, and perfectly protected from our guns, while we in the open ground must have fallen before their fire. But for the well-timed alarm, they might have massacred us all.

Disposed as we now were, our antagonists had not much advantage. The trunks of the trees intrenched us both. Only the concave side of our line was exposed, and the enemy might fire at it across the glade. But as the opening was fifty yards in diameter, and at no point had we permitted the Indians to get up to its edge, we knew that their bullets could not carry across; and therefore had no apprehension on this score.

The manœuvre, improvised though it was, had proved our salvation. We now saw it was the only thing we could have done to save ourselves from immediate destruction. Fortunate it was that the voice of Hickman had hurried us so quickly to our posts.

Our men were not slow in returning the enemy's fire. In a few seconds their guns were at play; and every now and then was heard the sharp whip-like 'spang' of their rifles around the circle of the glade. At intervals, too, rose a triumphant cheer, as some savage, who had too rashly exposed his red body, was known to have fallen to the shot.

Again the voice of the old hunter rang over the glade. Cool, calm, and clear, it was heard by every one.

'Mind yer hind-sights, boys! an' shoot sure. Don't waste neer a grain o' yer powder. Ye'll need the hul on't afore we've done wi' the cussed niggers. Don't a one o' ye pull trigger till ye've drawn a bead on a redskin's eye.'

These injunctions were full of significance. Hitherto, the younger 'hands' had been firing somewhat recklessly—discharging their pieces as soon as loaded, and only wounding the trunks of the trees. It was to stay this proceeding that Hickman had spoken.

His words produced the desired effect. The reports became less frequent, but the triumphant cheer that betokened a 'hit' was heard as often as ever.

In a few minutes after the first burst of the battle, the conflict assumed altogether a new aspect. The wild yells uttered by the Indians in their first onslaught—intended to drive us into confusion—were no longer heard; and the shouts of the white men had also ceased. Only now and then rose the deep 'hurrah' of triumph, or a shout from some of our party to give encouragement to his comrades.

At intervals rang out the 'Yo-ho-hee,' uttered by some warrior-chief to stimulate his braves to the attack.

The shots were no longer in volleys, but single, or two and three at a time. Every shot was fired with an aim; and it was only when that aim proved true—or he who fired it believed it so—that voices were heard on either side. Each individual was too much occupied in looking for an object for his aim, to waste time in idle words or shouts.

Perhaps, in the whole history of war, there is no account of a conflict so quietly carried on—no battle so silently fought. In the interludes between the shots there were moments when the stillness was intense—moments of awful and ominous silence.

Neither was battle ever fought in which both sides were so oddly arrayed against each other. We were disposed in two concentric circles—the outer one formed by the enemy, the inner by the men of our party, deployed almost regularly around the glade. These circles were scarcely forty paces apart; at some points, perhaps a little less—where a few of the more daring warriors, sheltered by the trees, had worked themselves closer to our line. Never was battle fought where the contending parties were so near each other, without closing in hand-to-hand conflict. We could have conversed with our antagonists without raising our voices above the ordinary tone; and were enabled to aim, literally, at the 'whites of their eyes!'

Under such circumstances was the contest carried on.

TO THE EDITORS OF CHAMBERS'S JOURNAL.

GENTLEMEN—In the series of papers contributed to your periodical by the gifted author of *John Halifax, Gentleman*, and recently published in a collected form, under the title of *A Woman's Thoughts about Women*, occur two serious misrepresentations of the doctrines of the Bible.

To your ever-present desire to disseminate truth, not falsehood—to inform, not to misinform, the people, the labours of your lives give unequivocal testimony. In accordance with the principles by which your efforts to popularise knowledge have ever been guided, you will

doubtless grant a place in your widely-circulated Journal to the few observations I am about to offer; the more readily, as they refer to the sacred, world-wide cause of Divine Revelation.

At page 301 of *Chambers's Journal*, Dec. 12, 1857, occurs this remark: 'I believe there is no other light on this difficult question, than that given by the New Testament. There, clear and plain, shines the doctrine of which, until then, there was no trace either in external or revealed religion—that for every crime, being repented of and forsaken, there is forgiveness with Heaven; and if with Heaven, there ought to be with men. This, without at all entering into the doctrinal question of atonement, but simply taking the basis of Christian morality, as contrasted with the natural morality of the savage, or even of the ancient Jew, which, without equivalent retribution, pre-supposes no such thing as pardon.'

I consider this, the second of the two passages referred to, *first*, because it is the more important in its action on the moral convictions of the human race. Its refutation here rests not on deductions, manifest as they are from the whole tenor of the writings of Moses and the Prophets. I shall, I am sure, best fulfil the duty I have undertaken by bespeaking the patience of your readers in verifying here the references I append below,* to one passage of each of certain of the inspired writers from Moses to Malachi. My difficulty in their selection has been, not to *find*, but to *withhold*; so numerous are the texts which shew that so far from the doctrine of the forgiveness of sin following on repentance, being 'unknown to the ancient Jew,' he was distinctly taught that by penitence, and penitence *alone*, could he secure the pardon of his God.

The other passage, whose fallacy but a superficial acquaintance with biblical history suffices to demonstrate, sets forth that: 'Nature herself has apparently decided for women, physically as well as mentally, that their natural destiny should be not of the world. In the earlier ages of Judaism and Islamism, nobody ever seems to have ventured a doubt of this. Christianity alone raised the woman to her rightful place as man's one help-meet for him, bone of his bone, flesh of his flesh, his equal in all points of vital moment.'

It seems to be almost an insult to the memory of your readers, who, from week to week, attend the services of their parish church, to remind them that the words quoted by our author as indicative of the true vocation of woman, and accompanied by the declaration that it was assigned to her by Christianity alone, are the very words in which her Creator's aim in her creation is described by Moses, in the earliest of all written revelations; or to advert to the part women played in the great drama of life, during the existence of both the republican and monarchical forms of government that prevailed in Judea. For, that the Hebrew women did appear as actors in many scenes of their race's history, is abundantly shewn by their *public* participation in all the most important national events; as also in that most sacred of all functions—prophecy. I once more cite,† on this head, the verses of Scripture. They tell of the 'Women of Israel,' who, by their words and deeds, aided the great cause of 'national and religious regeneration.'

The columns of a popular journal are not the fitting arena for polemical controversy or personal criticism, or it would be easy to prove, that while holding forth the urn, which our writer affirms is alone filled with the pure waters of life, the attempt to shew that the very source whence those waters *first* flowed, is turbid and impure, is as inconsistent as it is mistaken and futile.—I remain, Gentlemen, with much esteem, yours,

ANNA MARIA GOLDSMID.

OH! LOVE WHILE LOVE IS LEFT TO THEE.

FROM THE GERMAN.

Oh! love while love is left to thee;
Oh! love while love is yet thine own;
The hour will come when bitterly
Thou'lt mourn by silent graves—alone!

And let thy breast with kindness glow,
And gentle thoughts within thee move,
While yet a heart, through weal and woe,
Beats to thine own, in faithful love.

And guard thy lips, and keep them still;
Too soon escapes an angry word:
'Ah, Heaven! I did not mean it ill!'
But yet, he sorrowed as he heard.

Oh! love while love is left to thee;
Oh! love while love is yet thine own;
The hour will come when bitterly
Thou'lt mourn by silent graves—alone.

Unheard, unheeded then, alas!
Kneeling, thou'lt hide thy streaming eyes
Amid the long damp churchyard grass,
Where, cold and low, thy loved one lies.

And murmur: 'Oh! look down on me
Mourning my causeless anger still;
Forgive my hasty word to thee—
Ah, Heaven! I did not mean it ill.'

He hears not now thy voice to bless,
In vain thine arms are flung to heaven!
And stilled the loved lip's fond caress,
It answers not: 'I have forgiven!'

He *did* forgive—long, long ago!
But many a burning tear he shed
O'er thine unkindness—softly now!
He slumbers with the silent dead.

Oh! love while love is left to thee;
Oh! love while love is yet thine own;
The hour will come when bitterly
Thou'lt mourn by silent graves—alone!

M. G.

PURE AIR.

It is not only necessary that men may have sufficient air to breathe, but it is necessary to *provide air for the apartment itself* in which they live, as well as for the men who inhabit it. The influence of impure air is not only exercised upon the men through their breathing organs, but the surface of their bodies, their clothes, their seats, their tables, beds and bed-clothes, the walls of the apartments; in short, the free surfaces of everything in contact with the air of the place become more or less impure, a harbour of *foetides*, a means of impregnating every cubic foot of air with poison, unless the whole apartment has its atmospheric contents continuously changed, so that everything animate and inanimate is freshened by a constant supply of pure air.—*Medical Times*, May 1, 1858.

'FRENCH CRITICISM ON SHAKESPEARE.'

In the article with this title in No. 222, the translator of the Shakspearian sonnets alluded to is said to be Victor Hugo. To this announcement should have been added *this*: the translator is the son of Victor Hugo.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 239 High Street, EDINBURGH. Also sold by WILLIAM ROBERTSON, 23 Upper Sackville Street, DUBLIN, and all Booksellers.

SILENCE FOR A GENERATION.

Of making many books there is no end.

'Sir,' was heard to say the great monologuing moralist of our times—the modern Samuel Johnson of adoring English Boswells, American Goldsmiths, and aristocratic Mrs Piozzis—and since authors cannot be expected to write one thing and say another, the sentence may probably be found in print, though how could weak type deliver it with that ponderous monotonous roll of long-drawn vowels and harsh resolute consonants, which gives to the said moralist's speech even more originality than his pen—'Sir, the one thing wanted in this world is silence. I wish all the talkers had their tongues cut out; and all the writers had their pens, ink, and paper, books, and manuscripts, thrown into the Thames; and there were silence for a generation.'

One not a disciple might suggest that the illustrious moralist had better set the example; a satirical mind might begin to calculate the amount of possible loss to the world by such a proceeding. Nevertheless, a wise man's most foolish sayings are likely to contain some wisdom; and the above sentence deserves consideration, as involving certainly an ounce of solid truth in a bushel of eccentric extravagance.

Silence for a generation. What a state of things! No authors, and no reviewers, no orators political, controversial, or polemical; and no critics on oratory; no newspapers; no magazines; no new novelists to be advertised up; no new poets to be bowled down; travellers to wander, and never relate their adventures; men of science to make discoveries, and be unable either to communicate or to squabble over them; philanthropists allowed to speculate at will on the abuses of society, so long as they concealed their opinions; in short, returning to the ante-Cadmus period—the world to be compelled, in familiar but expressive phrase, 'to keep itself to itself, and never say nothing to nobody.'

What a wondrous time!—what a lull in the said world's history! Even to dream of it, sends through the tired nerves and brain a sensation of Elysian repose.

Silence for a generation—which generation of people, great or small, clever or stupid, should be born unheralded, grow up unchronicled, live uncriticised, and die unbiographised. It should feel, without discussing its feelings; suffer, without parading its sufferings; admire, without poetising its admiration; condemn, without printing its condemnations. Its good and ill deeds should spring up as naturally as

the flowers and weeds of a garden—to be left 'all a-growing and a-blowing,' or quietly pulled up. All this busy gabbling, scribbling, self-analysing, self-conscious society should be laid under a spell of hopeful dumbness—forced to exist simply, exempt even from the first axiom of metaphysics: 'I think, therefore I am.'

Such a state of universal silence, who would welcome? Possibly nobody; least of all those who have really nothing to say.

What in that case would become of the innumerable, shadowy throng who haunt every periodical; unanswered 'correspondents'; authors of unread manuscripts—of whom, a luckless editor once said to the present writer—in a sort of hopeless despair—'Don't say you're bringing me another manuscript. Look there! I've got a heap of them, two yards high.' And you, ye cumberers of publishers' shelves, in print and out of it, inditers of novels that nobody reads, poetry that nobody understands, and mental miscellanies that may be briefly ticketed as 'Rubbish: of no use to anybody except the owner'—what would be your sensations? You, too, young and ardent thinkers, so exceedingly anxious to express your thoughts, by word or pen, as if nobody had expressed the like before; and the world, as you honestly and devoutly believe, would be the better for that expression—as it might, Heaven knows!—truly, rather hard upon you would fall this compulsory silence. For you cannot yet see that, great as literature is, it is merely the fitful manifestation of the world's rich inner life—its noblest thoughts, its most heroic deeds; that this life flows on everlastingly and untiringly, and would continue to flow, were there no such things as pens, ink, paper, and authors; types, printers, book-sellers, and publishers.

Wofully, too, would such a crisis affect that race of *littérateurs* far, far below these, who pursue authorship simply as a trade, without the slightest faith in it or reverence for it—who, happening to have been brought up in what is termed 'literary circles,' possess hereditarily, or through habit, a certain aptitude with the pen, and accordingly make it a tool of business to write anything or everything, no matter what, so that, like any other tool, it suffices to earn their bread. What would become of them, who, like most gabblers, prate not out of their fulness, but their emptiness, if there were an age of silence?

There is another class as heavily to be condemned, and yet more pitiable than these—the authors, real authors, not bookmakers, whom such a law would teach, what they have not the moral courage to teach themselves, the timely necessity of silence. These

are, the writers who have written themselves out, yet still go on writing.

For example: a book appears; it has merit; it succeeds, and deserves to succeed. Its author rises into note, becomes a man whom coteries seek; whom the public flatters and esteems, publishers bargain with, urge, and sue. His wares are valuable, consequently the more produced of them the better. Money follows fame, and expenses follow money. He who wrote at first because he loved it, and could not help it, now writes for a living; or if he wrote at first for a living, now writes for an income—the handsome income that a man of talent can so willingly enjoy and so readily spend. People say: 'What a deal of money Mr So-and-so must make!'—as possibly he does; but they forget *how* he makes it. Not out of so many hours *per diem* of handwork or mechanical headwork, of ingenious turning of capital, or clever adaptation of other people's ingenuity. All his capital, all his machinery, all his available means of work, lie in a few ounces of delicate substance, the most delicate in the whole human structure, wonderfully organised, and yet subject to every disorganisation, mental or material, that chance may furnish—his brain.

People do not recognise this—perhaps he does not recognise it himself. He may be a very honest man, deserving all his fame and all his money. Yet both must be kept up; and how does he do it? He goes on writing for a long time—faithfully, no doubt, carefully, and well.

But Providence allows to every intellect only a certain amount of development, limited by certain laws, spiritual and physical, known or unknown, yet not one of which can be broken with impunity. The brain is like a rich quarry; you may work it out in a year, or you may, with care and diligence, make it last a lifetime; but you cannot get out of it more than is in it; and work as you will, you must get to the end of the vein some day. So does our author; but still—he writes on.

He must write; it is his trade. Gradually, he becomes a mere trader—traffics in sentiment, emotion, philanthropy. Aware of his own best points, he repeats himself over and over again. How can he help it? Whether he knows it or not, he has written himself out. For the rest of his career, he lives on the shadow of his former reputation—letting fall, perhaps, a few stray gems out of that once rich storehouse, his all but empty brain; or else he drops at once, a burnt-out candle, an oilless lamp, vanishes into such utter darkness, that at first, till posterity judges him more fairly, it is almost disbelieved that he ever shone.

This truth—fellow-authors, is it not a truth?—could be illustrated by a dozen instances, living as well as dead, did not charity forbid their being chronicled cruelly here.

Cases such as these, befalling not ignoble but noble minds, do indeed force us to see some sense in the severe moralist's impossible ultimatum. Surely it is worth pausing to consider whether the evil which he deploras could not be cured by any less arbitrary means than an age of silence.

The time is gone by when literature was a merely ornamental craft—when unsuccessful authors were Grub Street drudges, and successful ones some patron's idle hangers-on, or perhaps independent

patrons themselves. Gone by, also, except in very youthful and enthusiastic minds, the imaginary ideal of 'an author'—a demigod not to be judged like other men, whether he attain the climax of fame, or groan under the life-long wrongs of unappreciated genius.

Happily, in these days, we have very little unappreciated genius. Go round the picture exhibitions, and, depend upon it, you will find a large proportion of the really good pictures marked 'sold.' Go to any editor of magazine or journal, and he will tell you that he is thankful to get a really powerful original article by anybody, celebrated or obscure; that such papers will always command their fair price; and that the only reason of their rarely illuminating his pages is, the exceeding difficulty of getting them. Ask any publisher of honour, credit, and liberality—as the majority of them are—and he will own, that though a bad book may be puffed into factitious notoriety, and a good book, from various accidents, remain temporarily unknown—give each a fair chance, and they are sure to find their own level—a level which, in most instances, necessarily produces the same advantageous results to both author and publisher.

There can be little doubt that any writer of real genius, nay, even of available talent, will always be able, sooner or later, to earn a livelihood by the pen. Whether, hapless instrument! it will suffice to give dinners to millionaires, and furnish white gloves and velvet gowns for countesses' assemblies—whether it will, in short, supply to the man or woman of letters all the luxuries of the merchant-prince, and all the position of ancestral nobility, is quite another question—a question which is about as solemn as any writer can ask himself. Alas for him, if neither he nor his have the moral courage to give the answer!

In one sense, there is a great deal of cant sympathy and idle enthusiasm wasted upon authors and authorship. Noble as literature is, it is nevertheless no mere picturesque recreation; it is a profession, a calling, a trade if you will, to be pursued in all love and reverence, but as steadily, honestly, and rationally as any trade. You would laugh at a workman who threw away his materials; you would blame a merchant who rashly expended his capital; you would turn away, as from something dishonest, from a shopkeeper who tried to foist upon you, even through carelessness, goods inferior to those you expected him to sell, and wished to buy; and yet all these things, under fine names, are sometimes voluntarily or involuntarily perpetrated by authors. And surely not the least act of dishonesty—for it is fraud not against man only, but against his own soul and its Maker—is that when not for daily bread, but for 'position,' 'society,' 'keeping up a family,' and all the pegs on which excuses can be hung, a literary man goes on writing, writing, long after he has got anything to say.

For what is it that constitutes the author, as distinguished from the rest of the world, who live, suffer, and enjoy, in a placid, unconscious dumbness?—it is because he is the voice, the loosened tongue of all this mute humanity. Because, somehow or other, he knows not how or wherefore, he feels the infinite spirit stirring within him, teaching him to speak; and he must speak. He is no better—often, ~~about~~ less good—than the hundreds and thousands of silent ones. Yet in this he is set apart from them all—he is the speaker. Art, nature, with all their mysteries, by others only felt, are by him understood; perhaps into humankind generally he sees further than most people; but whether or no, to the extent that he does

see, has been given him the power to arrange and demonstrate, which has not been given to them. Without any vainglory or self-exultation—God knows how little there is to exult over!—every true author must be conscious of this fact, that by some great mystery, as incomprehensible to himself as to any one else, it has been granted him to express what others only experience—that, so to speak, he is the living voice of the world.

Then, in God's name—who has consecrated him such—let him dare not ever to open his mouth unless he has something to say.

Rather let him live moderately, feed plainly, eschew fashionable frivolities and expensive delights as he would the allurements of that disguised individual whom St Anthony's honest tongs seized by the beautiful nose. Let him turn his back upon adoring crowds who would win him from his true vocation—the worker and thinker, into that of the mere idler. Let him write, if needs must, for his daily bread—an honourable and lawful act; but as soon as he begins to write for his mere pleasures and luxuries, or for the maintenance of a certain status in the world, let him pause. And as soon as he feels himself writing, not because he is impelled thereto, having something to write about—but because publishers and public expect him to write about something—or worse, because money is to be made, and writing a book is the only way to make it—let him stop at once and cry: 'Get thee behind me, Satan. Lure me not to prostitute any gift I have—less for necessary bread and cheese than for things which are not necessary: riches, show, and notoriety.'

Better, in truth, live on honest bread and cheese, reducing his wants to the narrowest limit; better slip from the world of letters altogether into kindly obscurity, than go on—scribble, scribble, scribble—flooding the public with milk-and-water mediocrity, which does it no more good to read than him to write, reducing the noblest calling under the sun to mere journeyman's taskwork, and himself, his subtle intellect or brilliant imagination, to the condition of a spiritual suicide. For he has murdered worse than his body—his genius, his moral faculties, his soul.

And *cui bono*?

To most professional authors, this question at times presents itself forcibly. What is the good of writing at all, when the noblest of fictions, the grandest of poems, or the purest and most elevating of psychological disquisitions, is at best but a faint reflex of what is going on in the world every day? If that same world could only perceive it, its own simple and natural existence, in joy and grief, struggle, action, and endurance, is a higher thing than all imaginary representations or intellectual analyses thereof. Do we not, we authors, continually see living pictures, lovelier than any we can portray—ideals which, if transferred literally to paper and print, readers would never believe in? Do we not, creating our imaginary world—which the aforesaid reader may happen to think pleasant and fair—often smile at him in secret, while of ourselves and for ourselves we are more prone to sigh? What nonsense, what execrable travesty, all stage-paint, tinsel, and canvas, frequently appears this fictitious arena, compared to the realities around us, which we strive poorly to copy. How small seem our got-up tragedies—how shallow our feigned passions—how paltry our imaginary pathos, when we look at this, God's world, filled with men and women of His making; where we meet, as we do continually, scenes beyond all painting; characters of variety inexhaustible; histories that, in their elements of tragedy, pathos, heroism, tenderness, put to shame all our feeble delineations, making us feel that, so far from trying to portray it, we are hardly worthy to look in the face of it, this ideal beauty, this infinite perfection

—which, however disguised and corrupted, unseen or unrecognised, is the central essence of all our wonderful world.

And sometimes we would fain it were left as such, and not written about; that

Love, and beauty, and delight,
Whose might
Exceeds our organs, which endure
No light, being themselves obscure—

might rest in heavenly shadow, safe from frantic poets, vainly trying to imitate the inimitable;—that vice might perish out of the perishableness of her own corruption, undescribed, and unexposed; that virtue were left to dwell unconscious and at ease, without being startled by the sight of her own image—badly copied, and possibly somewhat out of drawing.

Ay, and oftentimes, especially on days such as this present day, when birds are singing, and green leaves budding, and all nature bursting out into redundant life—innocent of authors, printers, and books, does one long for a brief season of that celestial silence—to lie down and dream, without order, arrangement, or even consciousness in the dreams; to gaze, enjoy, observe, and act, naturally and involuntarily; to live and see all around us living—the life of a flower of the field.

Even as Wordsworth, the charm of whose genius is this power of making himself 'one with nature,' recalling how

I wandered lonely as a cloud
Which floats on high o'er vales and hills,
Till all at once I saw a crowd,
A host of golden daffodils:
Beside the lake, beneath the trees,
Fluttering and dancing in the breeze;

so that ever afterwards

In vacant or in pensive mood,
They flash upon the inward eye,
Which is the bliss of solitude—

Wordsworth himself can find no other form in which to define this exquisite sensation than that drawn from his flowers' existence:

And then my heart with pleasure fills,
And dances with the daffodils.

Truly, this sort of writing bids us pause in our demand for silence. It makes us feel that there is some good in authorship after all; that genius, the marvellous power which, by means of a few inches of black type and white paper, can re-convey to the human mind all its passions, emotions, and aspirations—can re-translate to it the whole beautiful and immortal life of the universe—this genius must be a wondrous gift—a divine possession. Let those who have it hold it—intact, unalienated, unsquandered, undefiled.

And for those who have it not, there is little to repine. They possess most of its benefits, safe from its dangers and tribulations. Any man, so long as he can enjoy a fine poem, feel his heart strengthened by a good novel, and his spirit refreshed by a few pages of any wholesome writing, rich in that true humour which is so great a lightener of the heavy burdens of life, let him rejoice and be thankful; he also has been in Arcadia.

For the rest, sorry pretenders to literature—vain chattering pies, who really have no song to sing, and only desire to hear the clatter of their own sweet voices—let them be! No need to have their small tongues cut out, or their luckless manuscripts tied up in a bundle, and flung into the Thames, or any other river. A few years will end all their clamour in an unbroken and eternal silence; and their works, designed to float down the stream of time, will soon

sink to the bottom by their own ponderosity, and afflict its waters no more. *Requiescant in pace!* All things find their own level very soon. The world will do extremely well even without silence for a generation.

PROGRESS OF PISCICULTURE.

IN No. 148 of this Journal (1st November 1856) we gave, under the title of Pisciculture, some account of the interesting experiments which were, and are still, being carried on at Stormontfield on the Tay, with the view of increasing our supplies of salmon, and determining certain disputed questions in the natural history of this favourite fish. We purpose now to bring down the history by referring to the progress made since then in artificial fish-breeding both at home and abroad.

So far as Scotland is concerned, the only experiments yet made, have been with salmon; but we are not without hope that, as the success of these become known, the system will be extended so as to include other kinds of fish, and also to lend its aid to the introduction and naturalisation in our rivers of the best food-fishes of other countries—such as the magnificent black bass of Canada, and the salmon of the Danube—described in another portion of this article. The principal reason why salmon has been selected for experiment is, doubtless, because of its being considered our most valuable native fish, and also from the cry which has arisen as to its danger of extermination from over-fishing, and want of adequate protection during close-time, and also, in some degree, to put an end to the uncertainty which has so long prevailed as to its mode of breeding and growth, and generally to ascertain the various stages of its progress from the hour of its birth to the day of its capture—the want of such knowledge having impeded effective legislation. In all the varied stages of its career, the history of the salmon has been the subject of much controversy; and no wonder, if we consider the singular fact that salmon, fit for the purposes of the cook, can be caught in the Tay, while the little parr is just venturing on its way to the sea—both being of the same brood, hatched perhaps the same hour!

When the eggs now under experiment at Stormontfield come to maturity and assume the smolt state, a few more points in the salmon controversy will be determined; but it will be a year or two before this consummation takes place, a portion of the young setting out for the sea at the end of the first year, and the rest remaining in the pond a year longer. In the meantime, we may devote a few paragraphs to a minor controversy which has arisen as to the proper way of sending impregnated ova from the Perthshire ponds to New Zealand, Australia, Tasmania, and other far-distant countries. The superintendent of the Perthshire fisheries has, we have reason to know, been overwhelmed with letters on the subject; and to lighten his correspondence, he promulgated, in conjunction with some of his Perth friends, a plan for the transmission of the ova, and also hinted at the possibility of transporting the infant fish. His idea was to fit up a small hatching apparatus on board ship, having a cistern containing ice to supply the water to the ova, and a reservoir to catch the fluid after its part was performed. No sooner was this idea made public than objections were taken to its practicability, and a multitude of epistles have appeared advocating different plans. One says the boxes containing the ova should be filled with sand; another, that they ought to contain horse-bean-sized gravel; while a third writer recommends 'stones the size o' life;' that is, such as are to be found on the natural spawning-

ground. We have not space to give even a brief *resumé* of all that has been said on this subject; but one individual recommends that, instead of ova, a quantity of the newly hatched fry should be sent out. Parr may be in water for a period of six or eight weeks before they begin to require food, and we know it to be a fact that they do not assume the livery of the smolt for twelve months, and that during that period they can be artificially fed with boiled liver, &c. Is it not possible, then, to carry the young fry to Australia instead of the ova, and thus make the thing a certainty? The voyage can be accomplished in from sixty to eighty days, and parr could be easily kept alive for so short a period. Our friend makes no pretension to be able to give practical instructions on this point—his wish is simply to recommend this mode of transporting the fish; and he even thinks that if the fry were near its first change, verging on the smolt stage, it might be still better, for then the instinctive desire for salt water could be freely gratified.

In detailing the great success which has attended the experiments conducted in various continental rivers and breeding-ponds, we may remind our readers that it is to the exertions of Gehin and Remy, two unlettered fishermen of the department of the Vosges in France, who practised pisciculture on the river Moselle and its tributaries, that we are indebted for the revival of this lost art. They were richly rewarded by the French government; while persons in our own country who had previously, or at least simultaneously practised the art as a means of settling various disputed questions in the natural history of the salmon, have been suffered to pass on their way unnoticed. The government of France, inspired by some of the learned savans of that country, at once took advantage of the example afforded by the success of Gehin and Remy, and the result was the construction at Huningue, near Basle, in 1852, of a monster fish-reservoir. By means of this parent establishment where the eggs are collected, upwards of seventy-one places in France have been furnished with ova.

Professor Anthony Wimmer of Landshut, in a letter to Mr Ashworth of Egerton Hall, near Bolton, gives an interesting account of the artificial propagation of the Danube salmon in Bavaria; and as some idea is entertained of acclimatising the fish in Scotland and breeding it in our rivers, we select such a portion of his communication as will give the reader some idea of its value:

'The Danube salmon is very similar in form to the trout, but much more gracefully shaped, and with a body similarly formed, and perfectly cylindrical. Its large mouth is furnished with very strong teeth; its back is of a reddish gray; its sides and belly perfectly white; the fins are bluish white; the back and the upper part of both sides are slightly and irregularly speckled with black and red roundish spots. But I could never discover any spots on its fins, which are the same in number and formed exactly like those of the trout. The young Danube salmon are always of a darker colour than those a little older, which become lighter in colour. From a single female salmon of this species, weighing 18 pounds, I obtained nearly 40,000 ova. These eggs are as large as those of the small salmon-trout, and are of a splendid golden hue. I could not refrain from observing, that I found the eggs of Danube salmon of this size, and, indeed, of the smaller Danube salmon, the most suitable for fecundation, and I never obtained such beautiful eggs, so fit for this purpose, from larger fish weighing from 30 pounds to 40 pounds each. The Danube salmon ova are hatched in 56 days, and the young fry attain to 1 pound in weight the first year; and, in the third year, if supplied with the requisite quantity of food, to 4 pounds-weight. The Danube salmon has similar migratory habits to

those of the sea-salmon, takes his regular journeys between the main river and the tributaries, in order to spawn; and for this purpose arrives every year in the month of March at Landshut (if water and weather are favourable, he arrives at the beginning of the month), where several hundred are annually caught. He selects a rapid place in the river Isar, but not exceeding five feet in depth; and upon loose gravel-beds the female makes holes with her tail, several feet in length, and at about 6 inches in depth—at which work she is assisted by her companion. At this season, great combats take place between the male fish. When the spawning is over, they immediately return down the Danube. The Danube salmon never entered the Black Sea. According to information, which I obtained with difficulty, I found they were never caught in the Sulina mouth of that river, and but very rarely in Moldavia or in Wallachia.

'One species only of the noble salmon genus is indigenous to the river Danube, and this is the Danube salmon, "*Salmo hucho*," called "Huck" in Bavaria. It is most striking that this large and beautiful fish is, with the exception of the mother-river, only to be found in those tributaries which flow into the Danube from the south; that is, those streams whose supply of water is derived from the Alps; and it is found very rarely in the tributaries which flow from any other districts. . . . The flesh of the Danube salmon is the most delicate, savoury, and valuable of any of our river-fish (excepting, perhaps, the Elmaul fish); it is sold in our market at from 24 kreutzers to 36 kreutzers per pound (not quite 1s.). Since the commencement of artificial propagation of fish, carried out under my direction, the quantity of Danube salmon has already perceptibly increased in the river Isar, along with the other species of salmon; and I hope, by this means, to obtain a still further increased quantity.'

Pisciculture has now extended to other parts of Germany, as well as Bavaria; and we extract the following brief notes on its general extension in the German states from a communication by Professor Fraas of Munich:

'Artificial propagation of fish is now being practised in almost every fishpond. All the various kinds of the salmon species, trout, Rhine salmon, sea-salmon, Salmon umbra, samleta, hucks (a German river-trout), pike, carp, tench, &c., are fit for this purpose. These may be produced in breeding-boxes and ponds, &c., in spring-water, during autumn, winter, and spring, according to our published methods. Salmon can be bred with success in vast quantities, two-thirds of their eggs being prolific, and all can be done at a very small cost. Salmon, moreover, are the most valuable of fresh-water fish; the sand-eels, sheat-fish, and eels, in general, alone rivalling them. Thousands and millions of these valuable fish may, therefore, be easily brought into our waters. In two instances, we reared with great success the fry of trout, in a canal which had for some time been dry, and did not contain traces of fish. The canal was 3 feet in breadth by 1 foot in depth, the current being about 6 feet in a second; the sides were covered with cresses, brook-lime, and water-parsnips; the soil was gravelly, and here and there holes from 2 feet to 2½ feet deep. The fry, six weeks old, were deposited in the current along with the breeding-box. One small fish after another escaped; after twenty-four to forty-eight hours the box was empty, and the trout dispersed in the water. One mile at least of canal is requisite for the sustenance of 2000 trout. They lived isolated in those places they at first occupied. In places surrounded by a wall, and through which fresh water ran, we kept trout-fry for one whole year. They swam singly, and attained the length of 2½ inches, without ever being fed by us.

They entered into secluded places at the entrance, and remained there for months, growing and increasing in size. We could not discover on what they lived.

'The fishermen of the Agricultural Society, as well as myself, travel to the different stations to give instructions to such establishments as desire it, in Bavaria. The connections of the establishment in Munich send fecundated eggs to Warsaw, Königsberg, Mecklenburg, Rhenish Prussia, Galicia, Hungary, and Carinthia; and people from all parts of Germany have come for instruction in pisciculture to Munich, even from Hanover, the place of its first discovery. The fisherman, who was formerly paid by the establishment, has earned so much money by the sale of fish-eggs, that he continues the business on his own account. He has sent to various places 200,000 Danube-salmon eggs in the last year, exclusive of millions of eggs of other species of fish. It must be remarked, that the size of the egg of the Danube salmon is the size of a pea, and they are not so numerous as those of other fish.'

The system of pisciculture has likewise been adopted throughout the Spanish peninsula, where considerable grants of money have been given to aid in its extension. In the course of a year or two, therefore, we may expect to hear that the rivers and lakes of Spain will be as prolific as those of the adjoining countries.

We will now lay before the reader a brief account of the interesting fisheries of the lake of Comacchio, near Ferrara, on the Adriatic. The inhabitants of this isolated district subsist chiefly on eels and other kinds of fish; and for the purpose of increasing the supplies and rendering them certain, they have constructed, from the mud of the lakes, an ingenious series of artificial dikes, which are interspersed with sluices, giving access both to the sea and to the two rivers which form the mouth of the Po. By this plan, Comacchio and its neighbourhood are partitioned off in districts or islands, each of which may be called a piscicultural farm, with its own particular fishery, fishing-implements, and residence. There are five hundred men, besides the manager, engaged in carrying on the fishery. These workmen and their families have to be maintained; and the poor of the community, the widow, the orphan, the infirm, and the aged, are all provided for out of the revenues of this lake-fishery. In 1597, the annual income derived was about L.12,000; but in the year 1792, it had increased to upwards of L.16,000, a very large sum in such a neighbourhood; and the annual income still continues to augment. It may be stated, as one of the remarkable features connected with this interesting community, that the lease invariably fixes the number of men to be employed, and designates the amount of pay they are to receive, which is irrevocable. 'This regular army of workmen is subject to the rules of a military hierarchy, and to the discipline of a life in barracks, and to a condition of passive obedience. They employ a brigade of 120 policemen and 100 overseers. The head-manager has under him a secretary keeping the registers. These two functionaries each receive ten shillings a month and their food, with an addition, daily, of two and a half pounds of fish. In each of the districts, there are young apprentices receiving two shillings and twopence a month, and their food.' At certain periods, we have been informed, there appears on the surface of the water myriads of small transparent fish, not unlike masses of gelatine, but which are, in fact, young eels just hatched, preparing to quit the place of their birth, in order to migrate to various other lakes, by way of the rivers of communication. 'The fishermen,' says M. Coste, 'have means of discovering whether or not the migration of these fish is abundant.

It consists in forming a frame of wicker-work, which, being placed at the bottom of the canal for a night or two, is then raised, and the abundance or paucity of the supply is thus ascertained. As the other kinds of fish are constantly appearing upon the surface of the water, it is only in reference to the eels that this plan is adopted.' After the eel has arrived at maturity, and it is about leaving the lagoon for the sea, it is captured in one of the marvellous reed labyrinths which have been constructed for the purpose—one of which, celebrated by Tasso, is still in use. There are many other fish reared at Comacchio—soles, plaice, and dory are abundant; and there is one in particular called *acquadelle*, not quite so large as our gudgeon, but so prolific as to be almost a nuisance, and which, after the eels have used great quantities of it as food, still yields an enormous amount of good manure. The chub are also most plentiful, and multiply infinitely. At one time they are so small that it takes a thousand or two to weigh a pound; but when twelve months old, they are twelve inches long, and five in girth.

The ceremonial of opening the season is presided over by one of their priests, who consecrates the lagoon by a solemn prayer, after which the fishermen open the various sluices and admit the waters of the sea: the fish are caught in the labyrinths in trying to get out. In one stormy night in the year 1797, 1000 baskets of fish were caught, and in one valley 200 baskets of eels. We may explain that annually, on the 2d of February, the sluices and labyrinths are opened, and remain open for two months, to admit of the passage of the young fish up the channel from the sea. Drag-nets of small mesh are prohibited during the migration of the fish. M. Coste says that the sea-harvest of Comacchio lasts for five months, commencing at the close of July. The weight of fish obtained in that period is at least one hundred thousand pounds per month. 'The want of water in the lake, excess of heat or frost, causes diseases among the fish; at one time, from five to six million pounds of dead fish had to be buried in consequence. In 1789, the Reno and Volano, mouths of the Po, were nearly dry, occasioning great losses to the inhabitants. In 1825, still greater loss was sustained from the same cause; when the inhabitants of the colony, in order to escape the pestilence, were obliged to dig deep ditches, and to bury upwards of six million pounds of fish in quicklime. A barrel of pickled eels costs 97 francs, and contains 150 pounds-weight. They have three methods of preparing the fish for market—by pickling, salting, and smoking them.'

So much for the cultivation of the water, which it is evident might become as fertile and important a field for human industry as the land.

THE BOARD OF GREEN CLOTH.

DESPITE the accusations that have been made against the aristocracy of this country, on account of their monopolising all the chief offices of the state, it is certain that a great number of them concern themselves with no other than that board whose title heads this paper. At all the great clubs of London, and at almost every country-house of any distinction, it sits, or rather stands, *en permanence*; and around it, all day long, and, at all events, for the most part of the night, its indefatigable members are to be found. In this one department at least, neither time nor health is grudged by those concerned in it; and so different is it from an institution of government in other respects, that he who, by assiduity and skill in its concerns, has proved himself the most deserving, is generally the best rewarded.

The board of green cloth, which probably originated in Italy, must have been in repute at least as

early as the sixteenth century, since Shakespeare alludes to it; but there is doubtless an anachronism in making Cleopatra one of its votaries. 'Let us to billiards,' says the Queen of Egypt to her attendant Charmian; but she can scarcely have meant to propose a contest upon a slate-table, with india-rubber cushions, and with cues with leathern tops. At Alexandria, and at that early period, none of the modern requisites would have been forthcoming, except, perhaps, the ivory balls. We cannot imagine the haughty beauty employed in such a pastime, any more than we picture to ourselves Mark Antony (as marker) calling the score.

In Mr Thackeray's *Edmond* we have some mention of the game as being a novelty even at the period of that tale; and certainly it was not until a very recent period that it assumed the complicated and scientific character which now distinguishes it. It was played for more than two centuries with only a couple of balls, and when the third or red ball was imported from France, the red winning hazard—that is to say, the holing of the red ball—was almost the sole object of the performers.

When we consider the many and wealthy firms whose trade has become exclusively that of making billiard-tables, the enormous number of rooms where tables are let out for hire in every populous town, and, in particular, the large and influential class who make the practice of this game, not so much their amusement as almost the very object of their lives, it certainly seems to us that billiards has got to be important enough to have a word or two written about it to the general reader. The professional and the amateur have already a score of elaborate works about this science, prepared with all the judgment and experience that would be necessary for the investigation of the most abstruse subject, and illustrated with accurate diagrams of what has been, and can be, effected upon a billiard-table for the instruction and edification of tyros.

It would, of course, be impossible to estimate the vast sums which depend upon every important match that chances to be, as the newspapers say, upon the toss—though, of course, it is to take place upon the table—and were we to mention the prices paid merely to witness such contests, they would exceed belief; but, as a proof of the interest with which great excellence at this game is regarded by its admirers, it may be stated that one guinea is habitually paid at the request of a certain professor for the privilege of witnessing his ordinary (and extraordinary) everyday play.

Sir Bulwer Lytton, in his novel of *The Caxtons*, has described a penniless lad who, by his skill at this amusement in France, rapidly acquires such considerable sums as he stands in need of; not in England, and in real life, does there appear to be any greater difficulty in so doing. What genius, what virtue, can procure its possessor, in ten times the period, a remuneration such as skill at billiards can in a few hours, and in almost any populous place, command! Carr, the celebrated Bath billiard-player, would have been immensely rich but for his fondness for another game at which he was by no means such a proficient: by this latter pastime he was perpetually being ruined; and on one occasion, having been forced to try his fortune in Spain, he returned from that country in even greater straits than those which occasioned his departure. Having landed, however, in Portsmouth, nearly penniless, and indifferently appraised, he repaired to his usual bank—the board of green cloth—in that town, and drew, from a respectable stranger, whom he found there, the sum of seventy pounds. By means of a portion of this he attired himself very splendidly, and betook himself to the same table the next morning, another and a better (dressed) man. His adversary was also there; and

not recognising him, after the metamorphosis, challenged him for still higher stakes, but with no better fortune. When he had lost as much as he could afford, he informed Carr that he was more unfortunate even than he seemed, for that he (Carr) was the *second* stranger, within twenty-four hours, to whom his really considerable skill had been obliged to succumb. This Bath player is said to have been the discoverer of 'the side-stroke,' an acquirement of great importance, the secret of which it is surprising that accident did not long before disclose, and the numerous frequenters of his rooms were excessively anxious to acquire this magic power of giving lateral impulse. After much solicitation, Carr confessed that the wonder lay in the particular kind of chalk which he was wont to use for his cue. He then procured a number of pill-boxes, and filling them with the powder of the chalk ordinarily used in the rooms, disposed of them to great numbers of the nobility and gentry, his patrons, at half-a-crown the box, as *Twisting Chalk!*

The spectacle of the play of some very first-rate performers, to one who knows the difficulties of billiards, is certainly such as almost to induce him to believe in patents of this description. The feats of Mr Kentfield—the celebrated 'Jonathan'—of Brighton, for instance, are more like things produced by magic than by natural skill. So continually are such as he accustomed to score, that himself and another excellent player finished thirty games of 'twenty-four up' within the hour. In a match of less than two hundred games, he beat his opponent eighty-five 'love-games,' those, that is, in which the adversary does not score a single hazard. With ordinarily good players, this gentleman is accustomed to take one pocket to his opponent's five; and, to convey a notion of his experience, he has played with one individual alone fifty thousand games of this kind; that is to say, estimating four games to be played within the hour—the one pocket-game being of course a very slow one—he has spent nearly one year and a half in knocking about ivory balls in company with a single fellow-creature. One celebrated match between a player still living (which one wonders at) and a French professor, lasted for two entire days and a night, during which the enthusiastic foreigner tasted nothing but liquids.

Mr Kentfield's principal excellence, according to his great panegyrist, Mr Mardon, from whose treatise upon billiards most of these notes are taken, consists in his admirable judgment of the amount of force to be employed in each stroke, with a view to the advantages that are to be made to follow; or, as it is technically expressed by members of the board of green cloth, in his 'good strengths.' He has been known, not uncommonly, to score four-and-twenty in canons alone; and on a particular occasion, two-and-thirty, *without moving the balls more than a span from their original position.* His greatest achievement—the diagram of which we would we could convey to these pages, from those of Mr Mardon, for the benefit, not of 'country gentlemen' (as the apology used to run for translating classical quotations), but of the unscientific public—was in a certain game with Captain W—, wherein Jonathan gave his adversary three strokes to one, and consisted in making a hazard from the red ball *off three different cushions!* It was his frequent custom, in the old days of the felling-linings, when his own ball was near the red one upon the spot, to score more than one hundred off that ball alone. Upon the present India-rubber cushions, no such positive certainties can be calculated upon; and the incorrectness of their angles is deservedly a reproach against them amongst the old school of players. The inventor of these resilient sides, himself a first-rate performer, was so annoyed with their

inaccuracy, that he was about to have them removed from his table after the first trial; but a party of gentlemen chancing to come in, were so delighted with the extraordinary speed, that he perceived the innovation must needs become a popular one. 'If the public is pleased,' said he, 'the cushions may as well remain.'

Mr Roberts, however, the superintendent of the billiard-rooms at the Manchester Union Club, seems to calculate even upon these with considerable nicety. He is said to have scored two hundred and eight in a single 'break,' and to have made one hundred and two upon another occasion from the red ball alone.

Of the strange effects produced in men of different dispositions, by having money dependent upon their skill at this amusement, there are many instances on record. The advantages of strong nerves over weak ones, in those who are members of the board of green cloth, are thus illustrated: Two gentlemen had for years frequented a certain subscription billiard-room without having taken or proposed a bet. One day, a spectator of the game then in progress offered to lay three hundred to two hundred on the result; and to the surprise of all present, one of the two gentlemen accepted the proposal. He won the three hundred pounds, and remained as cool as a cucumber.

On another match, his antagonist laid a wager of sixpence. During the progress of the game of 'twenty-four up' he evinced the greatest anxiety; and upon the marker calling the score, 'twenty-three all,' actually fainted away!

Inferior players, indeed, and even good ones, if excitable, or of weak nerves, when backing themselves for any stake that much affects them, are often reduced to a condition of almost prostration; in some instances, becoming incapable of imparting sufficient strength to a ball to enable it to reach the intended pocket. A game of fifty was once played, upon the result of which very large sums depended. The score of 'forty-nine all' was called by the marker, and repeated by the player. He hesitated; again asked for the score, and again the marker repeated, 'forty-nine all.' The player thereupon gave a safe 'miss,' whereby, of course, his adversary scored one, and won the game. On another occasion, in a room crowded with spectators greatly interested in the event, a nervous player required but two points to complete the game; a certain hazard was presented to him upon either side. The player, in anxious bewilderment, actually played with the red ball!

Although Mr Mardon recommends, indeed, that a stake sufficiently large to keep up the player's vigilance and attention be always played for, he is, for an *habitué* of the billiard-table, quite a moralist, and to the young, the most prudent of mentors. Never, advises he, be induced to bet with a stranger against his accomplishing a particular stroke, however difficult, since even an indifferent performer may, by practice, succeed in making a certainty of any single feat. Do not advance upon your original wager after losing a game or two. Nor, O youth, be thou inflamed with the desire of winning back what thou mayest have already lost—a weakness, it seems, so common among the associates of the board, as to have obtained for itself the technical expression of being 'pricked.' These temperate reflections and moral precepts of our author remind one of nothing so much as that celebrated address of the dying toper to his sons: 'Drink slow; never mix your liquor; nor sit, boys (if you can help it), with your backs to the fire.'

Was the progress of philosophy ever described by any of its professors, jealous for his particular school, in more glowing words—was delight in the contemplation of the long results of science, ever painted in more brilliant colours than these which follow?

'The game of billiards, I am inclined to believe,'

writes Mr Mardon, 'is in most parts of England still creeping with infant steps. At Brighton, it has reached to the stride of manhood, each break evincing the knowledge and sound judgment of maturer years. Persons witnessing the style of game of the parties to whom allusion is now made (that is, Mr Kentfield and Co.), and capable of appreciating the beauties attendant upon superior execution combined with exquisite *strengths*, would behold a mine of hidden treasure brought to light, and experience an enjoyment worthy of hours of reflection.' This book, remember, was published in its second edition (from which this extract is made) in 1844, so that by this time perhaps Brighton may have culminated, and lapsed into second childhood; and we may be all too late, however rapidly we may hasten to behold this mine. We ourselves, however, have done our duty in making public the precious advantages it holds out as soon as we learned them ourselves.

We have also the pleasing intelligence to communicate, obtained from the same source, of a golden cue being open to be played for by the amateurs of all England, subject to certain conditions, under which the winner is to hold it as champion of the billiard-table, president of the board of green cloth. It is open, as a reverend wit observed, to rich and poor alike, like law and the London Tavern, only you must pay ten pounds as entrance-money, and be prepared for a few matches more after you have got it, if you intend to keep it. Still, there is something chivalric, and almost regal, in a golden cue. Fancy one's winning it! Fancy one's walking away with it up the chain-pier, while the band was playing! Fancy one's horror if it chanced to slip through the side-rails into the sea! Fancy one's being robbed of it, and knocked on the head—like poor Miss Kilmansegg—with the but-end of it afterwards! Fancy one's leaving it within one's will, a richer legacy than house or land, unto one's issue! What a gold stick in waiting would it indeed be for one's eldest born! What a rich import would that simple expression then bear of 'I gave him the cue!'

THE BARON GRANDENIGO'S DAUGHTERS.

THE three young daughters of the great Baron Grandenigo having been deprived by death of their mother, who had always rather inclined towards spoiling them, her place was excellently supplied by an ancient female relative, who came unasked to superintend the domestic affairs of the Baron's secluded stronghold among the green mountains. There she regulated the household, jingled the keys, and was especially particular in watching over defences and drawbridge, the baron himself being usually absent at his sovereign's court, or fighting his sovereign's battles; so that old Madame Offugo felt she had a responsibility in her self-imposed task, which made her doubly careful. The three young ladies of Grandenigo were good-natured girls on the whole, but they had their faults like the rest of us; and Madame Offugo made it her study to discover and root out, as far as possible, those noxious weeds which disfigured the otherwise fair and promising parterres. Lisa, Lota, and Lora, as the three young ladies were named, greatly revered and respected Madame Offugo; nor had she failed to inspire them with a good deal of awe, though she never scolded them, nor treated them with harshness, but, on the contrary, was always kind and considerate. Yet Madame Offugo had queer ways of her own; and as those were the days, and theirs was the country, when fairies were still authentic facts, it is not in the least surprising that some folks went so far as to hint that Madame Offugo claimed kin with the elfin race.

At Grandenigo they all led a life of comparative

retirement, free from the cares, anxieties, and turmoils of the outer world; but this could not be expected to last always, as Baron Grandenigo was a person of importance in the solemn councils of the land, and his daughters would in time be summoned to the sovereign's court—roses and lilies fresh from the mountains, and sweet as their wild-thyme and blooming heather. Madame Offugo did not spare to tell her young charges of their faults, whenever she saw occasion to do so; to warn, exhort, and instruct. To Lisa, the eldest, she would say: 'You are prone to search for defects in everything, and not only that, but you see a great many things you ought *not* to see. People must sometimes walk with a shade over their eyes in this world; ay, even blindfolded it may be. Your eyes are not given to you in order to pick out flaws and to make quarrels, but for good and wise purposes: to be useful, and to behold the glories of a beautiful universe, the work of a beneficent Creator.'

Lisa perfectly understood old Madame Offugo's words; for her bright black eyes were dreaded at Grandenigo—poking and peering about everywhere, and into everything, and seeing things in such a manner, that the poor maids said Lady Lisa must surely wear a pair of magnifying-glasses. This did not effect much harm or perplexity in the quiet retreat of Grandenigo; but Lady Lisa was going to a town-life, to a courtly circle, and therefore Madame Offugo lectured her in time, and of course, as all lecturing is, for her 'own good.'

Lady Lota, though not quick-sighted, like her eldest sister, but, in fact, quite otherwise, made up for that defect by the extraordinary acuteness of her hearing—her ears doing as much mischief, in the way of quarrelling and magnifying, as the Lady Lisa's bright eyes. Madame Offugo had more than once, and with much majesty and severity, impressed on Lady Lota's mind that well-known adage—applicable at grand baronial Grandenigo as elsewhere—that 'listeners never hear any good of themselves.' Hence it may be inferred, alas! that the Lady Lota,—despite her descent from the ancient Grandenigos—was not wholly free from human failings, or rather, we might more justly say, meannesses. Hence the Lady Lota's temper, it is to be feared, was ruffled and disturbed by not hearing 'good of herself'; 'and if,' as Madame Offugo sagely remarked, 'good is not spoken of us at home, what shall be said of us in the cold, hard world?'

The Lady Lora, the youngest of the three sisters of Grandenigo, did not make so much use of her eyes and ears as she did of her own little tongue; she retailed what Lisa *saw*, and what Lota *heard*, fluently, unfailingly, and, we regret to add, exaggeratingly. She did not like the trouble of doing anything but talk—talk: she left her eldest sister to look about her, and poke and peer here, there, and everywhere; she left her second sister to saunter unsuspected, with her ears wide open, because *she was so near-sighted*, and who dare accuse a Grandenigo lady of listening? Now, that troublesome little member the tongue can do a world of mischief, as we all know; and Madame Offugo said everything to Lady Lora that was right, and true, and kind, and wholesome on this topic. And the Lady Lora listened with respectful attention, and promised not only to remember what was said, but to try to follow the kind and motherly advice. And so did the Lady Lisa, and the Lady Lota; but in the meantime, the unruly eyes, and ears, and tongue often rebelled, and occasioned a vast deal of petty trouble and vexation among the small community of Grandenigo.

Suddenly Madame Offugo was wanted elsewhere: the drawbridge was let down, and she crossed it quickly, disappearing in the winding road leading up

the hillside from Grandenigo, and leaving the three young ladies weeping bitterly, and waving their white handkerchiefs, and kissing their hands as the good old lady receded.

'Don't forget us, dear Madame Offugo,' said they on parting.

'I will not, my dears,' she replied, and she spoke with impressive emphasis.

And now Baron Grandenigo took his three girls away to the court of his sovereign, in the midst of a gay and populous city. The change was very great indeed for young ladies brought up in retirement, like our Lisa, Lota, and Lora; and at first they forgot good old Madame Offugo and her excellent advice and tender admonitions. But as time progressed, they were never out of 'hot-water,' as the saying is—always getting into trouble, from seeing what ought not to have been seen, hearing what was not meant to be heard, and speaking what it was inconvenient and dangerous to retail; far, far more so here in the city and the courtly circle, than at quiet Grandenigo, sleeping among the pleasant heathery hills. And their troubles and perplexities so increased, that one evening when they had retired rather earlier than usual, and had dismissed their attendants, and were conversing with terror and dismay on their lamentable position, all three exclaimed together: 'O that dear old Offugo was here to direct and aid us. I wonder if she has quite forgotten us by this time: she said she wouldn't.'

At that instant, a gentle tap, tap, came to their door, and a little page in green gave in a small packet, silken-bound, addressed to the ladies Lisa, Lota, and Lora. Quickly they opened it, and what did they behold? First the words written in golden type: 'I have not forgotten you—do not you forget old Offugo.' And the contents of the packet? Each sister blushed consciously as she appropriated to herself one of the three gifts it contained; thus proving that they had not altogether forgotten old Offugo's lessons. How the court circle would have laughed and jested had they seen these 'remembrances,' so carefully bound up with silken cord, and so fondly and reverently received by the sisters in the privacy of their own chamber. And what were they?—what mysterious and inexplicable things to send from a distance to three fair young ladies, daughters of the grand Baron Grandenigo?

First, there was a woven bandage—thick and smooth, flexible and elastic—to bind over the eyes, as if for playing at blind-man's-buff. Lady Lisa fitted it on directly; intuitively she understood its meaning and arrangement. Then came a bundle of fine white cotton-wool, rolled up in golden tissue. Lady Lota stuffed some into her ears on the spot. Then, what a funny-looking thing! They all three laughed aloud as the Lady Lora put it into her pretty mouth, though she declared afterwards it became as sweet as a sugar-plum to her taste. But the greatest wonder of these gifts was—proving beyond a doubt that Offugo must be a fairy—that although the three fair daughters of Grandenigo continued to wear them at all times and on state occasions, their true significance continued unsuspected. The bandage, by fairy contrivance, only resembled a becoming fillet round the ivory brow; the cotton-wool was hidden by the ebon tresses, so coquettishly disposed for the purpose; and as to the uncourtly gag, being inside the mouth, it was not seen at all. A fascinating reticence was the consequence of that; and for ever afterwards, the ladies of Grandenigo walked through this weary world with far less stumbling and discomfort to themselves, than if they had seen too much, heard too much, and spoken too much by the way.

Some of us in these days need the gifts of a good

for our own share; for sometimes, if we desire to live in peace, it is better to tie a bandage over our eyes, and to stuff our ears with cotton-wool, and furnish our mouths with a gag—even though it does not taste like a sugar-plum.

WIND-CHARTS AND BOTTLES OF SMOKE.

'Would you like to see my wind-charts?'

Such was the query wherewith that worthy mariner, Captain Scuttle, of the 'fast-sailing, A1 clipper-ship' *Flyaway*, one day startled the writer. At the time, we were in 57° 37' south latitude, and 85° 52' west longitude, heading east by south; in other words, we were approaching Cape Horn. In the innocence of our hearts, we had propounded a question relative to our course after passing that grim and dreary extremity of the earth; and the answer came in the form of the proposition quoted above. This mode of reply was but natural, for Captain Scuttle is a native of the Emerald Isle. Still, we were surprised to the extent of temporarily abandoning that dignified propriety of demeanour which, we flatter ourselves, is our usual characteristic. Had the question emanated from one of those disagreeable and irrational sailors who hold all and sundry landmen in utter contempt for their ignorance of the arts and mysteries of navigation, we should have concluded that a monstrous hoax was about to be played off upon us. But Captain Scuttle is a gentleman, not only when ashore, as is often the case; but on his own quarter-deck, or at the head of his cabin-table, he is still the very pink of courtesy; of a somewhat antique fashion, it may be, but none the worse for that.

We therefore repeated the phrase in astonishment. Wind-charts indeed! Well, Shakspeare long since called the air 'a chartered libertine.' But that the aerial dominions could be mapped out—that the jurisdiction of the several powers of the air could be accurately defined—their currents noted down, and their variations predicted, with a near approximation to precision; all this was a feat which, if the idea had ever occurred to us, would have been instantly dismissed from our minds, as something too wild even for the distorted imagination of a lunatic.

But we were not long suffered to remain incredulous. Our nautical friend dived into the recesses of his own peculiar cabin, whence he presently emerged with a portfolio, containing a series of veritable charts of the wind, which he proceeded to display for our information and gratification. At first sight, these appeared like the vague drawings of an experimental geometrician—angles and triangles, pentagons, hexagons, and all the rest of the poly-gon tribe, intermingling with each other in most admired disorder. But aided by the lucid explanations of Captain Scuttle, we quickly succeeded in understanding the real order which lay hidden under all this apparent confusion.

We found, then, that in these charts the surface of the ocean is divided into quadrangular areas, each containing ten degrees of longitude and ten of latitude. In the centre of each of these geographical spaces is one of the peculiar diagrams already noticed, and which consists, in fact, of a group of angles, symbolising the power and current of the prevailing winds in that particular region. The direction of these angles indicates that of the air, and their greater

suppose a figure, with one large angle, pointing southward, and three of smaller size, facing respectively south-south-east, south-east, and south-west by south: this would signify that strong northerly winds ordinarily prevailed, with occasional variations to the north-north-west, the north-west, and the north-east by north.

But, as in no part of the world does the wind incessantly blow in one uniform direction, it is necessary to have separate charts for each month in the year, and thus is maintained an entire circle of aerial intelligence.

The benefit derived, and yet more extensively derivable from this novel adaptation of meteorological science, is incalculable. By its aid, the mariner is enabled to avoid foul or contrary winds, hurricanes, and calms, and to steer in the direction of those latitudes where favourable breezes generally prevail at specified seasons. Not only, therefore, are the dangers of the ocean lessened, but the length of the voyage is often greatly reduced, and thus is effected a saving of labour, time, and expense.

These charts are, in fact, the records of past experience. The merit of their invention is due to Lieutenant Maury, of Washington, who first conceived the idea of tabulating the variations of the atmosphere at sea. In accordance with his plan, the officers of the United States navy were furnished with instructions and directions for observation, and were required to forward to Washington, at stated intervals, copies of their log-books, describing the force and direction of all winds and currents encountered, together with daily notes of temperature, &c. Masters of merchant-ships, willing to co-operate in this work, were also provided with similar facilities for observation. From the united records thus obtained, Lieutenant Maury compiled a series of tables, demonstrative of the important fact, that certain currents of air prevail in every portion of the Atlantic at regularly recurring intervals.

The beneficial effects of Maury's system soon became apparent; and in 1855, the English government established an office in London for the purpose of registering what may be termed the tides of the atmosphere. Admiral Fitzroy was placed at the head of the new department, and agents were appointed at the principal ports of the United Kingdom for the supply of instruments, books, and instructions. The attention of our mercantile marine was drawn to the subject, and their assistance invited. The commanders of some hundreds of British vessels have responded to the call—undertaking to make and record the necessary observations, and to transmit them periodically to the office. In 1857 it was stated that 'seven hundred months of logs' had been received from nearly one hundred merchant-ships, and that they were in process of tabulation, which is effected 'by collecting together, in separate books, the combined observations of each month, corresponding to geographical spaces, bounded by meridians and parallels, ten degrees apart. It is proper to observe that these observations are not confined to the Atlantic, but have been extended to the Indian and Pacific Oceans, and all seas ordinarily navigated. The results are the wind-charts we have described.

Philosophy and science destroy, in their progress, many time-honoured and fondly cherished ideas. No enthusiastic young poet, or magniloquent declaimer on the rights of man, can henceforth venture to speak of unloosing 'the four winds of heaven,' for they have never been chained up. It is proved, beyond the possibility of a doubt, that they perform their allotted functions periodically, in every quarter of the globe, with a surprising degree of regularity. Neither can that other figure of speech which terms the air 'a chartered libertine,' be tolerated, save out of respect

for our Shakspeare's genius. And, in truth, the expression is somewhat slanderous. Chartered he may be, but the charge of libertinism can scarcely be sustained. His incomings and outgoings have been registered; his irregularities 'set in a note-book;' his passionate humours, and his moments of supineness, duly recorded; so that every one who sails upon the deep may learn his character, and know pretty well what treatment to expect from him at all times and seasons, and in every part of the ocean.

Having discussed the wind, let us now indulge in a bottle of smoke.

We had such an article placed in our hands not long since. It was an ordinary glass bottle, such as those into which expert packers force a quart of porter; but which never, by any known process, can be compelled to disgorge more than a pint and half. It contained a thin liquid of a bluish-gray colour; and we were instructed to pour a certain proportion into such brine-pans as contained hams or other comestibles, for the purpose of imparting thereto the flavour peculiarly appertaining to smoked meats.

So we did; and very excellent we found the receipt to be.

Now, this liquid was not the cunningly devised product of chemistry, possessing the taste of smoke, without any approximation to the reality. It was real *bona-fide* smoke, procured from wood, and bottled up in its unadulterated purity, and was obtained in this wise:

In South Wales, there exists an establishment for the manufacture of pyroligneous acid, an article much in favour with the great pickling-houses. What is generally supposed to be white-wine vinegar, is often, in reality, the product of these works; and it is well for the consumer if more deleterious ingredients are not used. As its name indicates, this acid is obtained from burning wood, of which large quantities are annually consumed. For some time, the smoke arising therefrom was allowed to escape; but these are not the times to waste anything. Modern science, as Dr Lyon Playfair observes, is a great economist. She collects cast horseshoe nails, and, hey, presto! they reappear as murdering guns and glittering sabres; she carefully saves 'the clippings of the travelling tinker,' and, mixing them with 'the parings of horses' hoofs, or the cast-off woollen garments of the poorest inhabitant of the sister isle,' reproduces these unconsidered trifles in the form of 'hues of the brightest dye,' to adorn the dresses wherewith our courtly dames delight to deck their persons. The convenient vesta, or lucifer-match, owes its phosphoric constituents to the bones of dead animals. *Aquaforia*, and the offensive oils from gas-tar, are converted into perfumes for my lady's toilet; and the delicate odour of the costly *eau de mille fleurs*, can boast no better origin than the noxious effluvia of our sewers.

Clearly, then, it was a mistake to allow even wood-smoke to

Waste its fragrance on the desert air.

So, without the constraining influence of an act of parliament, the proprietors of the pyroligneous acid-works resolved on economising and utilising their smoke. For this purpose they built, over the pyre, a condensing chamber, and the smoke entering therein, and having no outlet, became converted into a fluid, such as we have described. In this state it was, and, we presume, still is, bottled off for public consumption; and its use effecting a great saving of expense in the curing of such meats as require to be smoked for the gratification of epicurean palates, a considerable demand for it has arisen. So that 'a bottle of smoke' is no longer the impossible fiction which it was supposed to be in the good old times of our youth, but has been resolved into a substantial reality, and

claims its place amongst those ingenious appetisers, which—as the manufacturers say in their advertisements—‘no good housekeeper should be without.’

OCEOLA:

A ROMANCE.

CHAPTER LXXXIV.—A DEAD SHOT BY JAKE.

FOR two hours this singular conflict was continued, without any material change in the disposition of the combatants. Now and then an odd man might be seen darting from tree to tree with a velocity as if projected from a howitzer—his object, either to find a trunk that would afford better cover to his own body, or a point that would uncover the body—or a portion of it—of some marked antagonist.

The trunks were barely thick enough to screen us. Some remained on their feet, using the precaution to make themselves as ‘small’ as possible, by standing rigidly erect, and keeping their bodies carefully aligned. Others, perceiving that the pines bulged a little at the roots, had thrown themselves flat upon their faces, and in this attitude continued to load and fire.

The sun was long since high in the heavens, for it had been near sunrise when the conflict began. There was no obscurity to hide either party from the view of the other; though in this the Indians had a slight advantage on account of the opening in our rear. But even in the depth of the forest there was light enough for our purpose. Many of the dead fascicles had fallen—the ground was deeply bedded with them—and those that still drooped overhead formed but a gauzy screen against the brilliant sunbeams. There was light sufficient to enable our marksmen to sight any object as large as a dollar-piece that chanced to be within range of their rifles. A hand, a portion of an arm, a leg badly aligned, a jawbone projecting outside the bark, a pair of shoulders too broad for the trunk that should have concealed them, even the outstanding skirt of a dress, was sure to draw a shot—perhaps two—from one side or the other. A man to have exposed his full face for ten seconds, would have been almost certain of receiving a bullet through his skull, for on both sides there were sharpshooters.

The two hours had passed, and as yet without any great injury received or inflicted by either party. There were some ‘casualties,’ however; and every now and then a fresh incident added to the number, and kept up the hostile excitement. We had several wounded—one or two severely—and one man killed. The latter was a favourite with our men, and his death strengthened their desire for vengeance.

The Indian loss must have been greater. We had seen several fall to our shots. In our party were some of the best marksmen in Florida. Hickman was heard to declare he ‘had draved a bead upon three, an’ wherever he draved his bead, he war dog gonad sartin to put his bullet.’

Weatherford had shot his man, killing him on the spot. This was beyond conjecture, for the dead body of the savage could be seen lying between two trees where it had fallen. His comrades feared, that in dragging it away, they might expose themselves to that terrible rifle.

After a time, the Indians began to practise a chapter of tactics, which proved that, in this mode of warfare, they were our superiors. Instead of one, two of them would place themselves behind a tree, or two trees that stood close together; and as soon as one fired, the other was ready to take aim. Of course, the man at whom the first shot had been discharged—fancying his *vis-à-vis* now carried an empty gun—would be less careful about his person, and likely enough to expose it.

Such proved to be the case—for before the bit of craft was discovered, several of our men received wounds, and one more of our number was shot dead by his tree.

This ruse increased the exasperation of our men, the more so that they could not reciprocate the strategy. Our numbers were not sufficient. To have taken post by ‘twos’ would have thinned our line, so that we could not have defended it. We were compelled, therefore, to remain as we were, but grew more careful how we exposed ourselves to the cunning fence of our enemies.

There was one instance, in which the savages were paid back in their own coin. Black Jake and I were partners in this *revanche*.

We were sheltered by two trees almost close together, and had for antagonists no less than three savages, who had been all the morning most active in firing at us. I had received one of their bullets through the sleeve of my coat, and Jake had the dandruff driven out of his wool; but neither of us had been wounded. During the contest, I had got sight upon one, and fancied I had spilled his blood. I could not be certain, however, as the three were well covered behind a clump of trees, and hidden by a thicket of dwarf palmettoes.

One of these Indians, Jake wished particularly to kill. He was a tall savage—and much larger than either of the others. He wore a head-dress of king-vulture plumes, and was otherwise distinguished by his costume. In all probability, he was a chief. What was most peculiar in his appearance was his face—for we saw it at intervals, though only for an instant at a time. It was covered all over with a scarlet pigment—vermilion it appeared—and shone through the trees like a counterpart of the sun.

It was not this, however, that had rendered the Indian an object of Jake’s special vengeance; the cause was different. The savage had noticed Jake’s colour, and had taunted him with it several times during the fray. He spoke in his native tongue, but Jake comprehended it well enough. He was spited—exasperated—and vowed vengeance against the scarlet chief.

I contrived to give him an opportunity. Cunningly adjusting my cap, so that it appeared to contain my head, I caused it to protrude a little around the trunk of the tree. It was an old and well-known ruse, but for all that, in Jake’s phraseology, it ‘fooled’ the Indian. The red face appeared above the palmettoes. A puff of smoke rose from below it. The cap was jerked out of my hand; I heard the report of the shot that had done it.

Simultaneously I heard another crack, louder and nearer—the report of the negro’s piece.

I peeped round the tree to witness the effect. A spot of darker red dappled the bright disk—the vermilion became suddenly encrimsoned. It was but a glance I had, for in the next instant the painted savage lay doubled up among the bushes.

During all the time we had been engaged, the Indians did not appear desirous of advancing upon us—although certainly they were far superior to us in point of numbers. The party we had been pursuing had been joined by another as numerous as itself. Not less than a hundred were now upon the ground, and had been so from the beginning of the fight. But for this accession, they would hardly have dared to attack us; and but for our knowing it, we should have charged them at once, and tried the chances of a hand-to-hand conflict. But we saw that they far outnumbered us, and we were content to act on the defensive to hold our position.

They appeared satisfied with theirs—though by closing rapidly inwards, they could have overpowered us with numbers. After all, their ranks would have

been well thinned before reaching our line, and some of their best men would have fallen. No men calculate such chances more carefully than Indians; and perhaps none are inferior to them in charging a foe that is intrenched. The weakest fort, the most flimsy stockade, can be easily defended against the red warriors of the West.

Their intention having been foiled, by the failure of their first charge, they appeared not to contemplate another—contented to hold us in siege—for to that situation we were in reality reduced.

After a time, their firing became less frequent, until it nearly ceased altogether; but we knew that this did not indicate any intention to retreat. On the contrary, we saw some of them kindling fires afar off in the woods—no doubt with the design of cooking their breakfasts.

There was not a man among us who did not envy them their occupation.

CHAPTER LXXXV.

A MEAGRE MEAL.

To us, the partial armistice was of no advantage: we dared not stir from the trees. We were athirst, and water within sight—the pond glittering in the centre of the glade. Better there had been none, since we dared not approach it; it only served to tantalise us.

The Indians were seen to eat, without leaving their lines. A few waited on the rest, bringing them food from the fires. Women were observed passing backward and forward, almost within range of our guns.

We were, all of us, hungry as famished wolves. We had been twenty-four hours without tasting food—even longer than that—and the sight of our enemies, feasting before our very faces, gave a keener edge to our appetites, reviving at the same time our anger and chagrin. They even taunted us on our starving condition.

Old Hickman had grown furious; he was heard to declare that he 'war hungry enough to eat a raw Indyan, if he kud only jist git his teeth upon one;' and he looked fierce enough to have carried out the threat.

'The sight o' cussed redskins,' continued he, 'swal-lerin' hul collops o' meat, while Christyian whites hain't neery bone to pick, war enough to rile one to the last jeint in the eend o' the toes—by the tarnal allygator, it war!'

It is a bare place, indeed, where such men as Hickman and Weatherford will not find resources; and the energies of both were now bent upon discovery. They were seen scratching among the dead needles of the pines, that, as already stated, formed a thick layer over the surface of the ground. Of what were they in search?—worms? grubs? larvæ, or lizards? One might have fancied so; but no—it was not come to that. Hungry as they were, they were not yet ready to feed upon the reptilia. A better resource had suggested itself to them; and shortly after, a joyful exclamation announced that they had discovered the object of their search.

Hickman was seen holding up a brownish-coloured mass, of conical form, somewhat resembling a large pine-apple. It was a cone of the broom-pine—easily recognisable by its size and shape.

'Now, fellers!' shouted he, in a voice loud enough to be heard by all around the glade, 'jest gather a wheen o' these hyar tree-eggs, an' break 'em open. Ye'll find kurnels inside o' 'em, that ain't bad chawin'. They ain't equal to hog an' hominy; but we hain't got hog an' hominy; an' these hyar 'll sarve in a pinch, I reck'n. Ef ye'll only root among the rubblege aroun' ye, ye'll scare up a wheen. Jist try it.'

The suggestion was eagerly adopted, and in an instant 'all hands' were seen scratching up the dead leaves in search of pine-cones. Some lay upon the surface near at hand, and were easily procured, while others further off were jerked within reach by ram-rods or the barrels of rifles. Less or more, every one was enabled to obtain a supply.

The cones were quickly cut open, and the nuts greedily devoured. It was by no means an inferior food, for the kernels of the broom-pine are both nutritive and pleasant to the taste. Their quality gave universal satisfaction—it was only in quantity they were deficient—for there were not enough of them within reach to stay the cravings of fifty stomachs hungry as ours were.

There was some joking over this dry breakfast; and the more reckless of the party laughed while they ate, as though it had been a nutting frolic. But the laughter was short-lived—our situation was too serious to admit of much levity.

It was an interval while the firing of the enemy had slackened, almost ceased; and we had ample time to consider the perils of our position.

Up to this time, it had not occurred to us that we were in reality *besieged*. The hurried excitement of the conflict had left us no time for reflection. We only looked upon the affair as a skirmish, that must soon come to an end by one side or the other proving victorious.

The contest no longer wore that look; it had assumed the aspect of a siege. We were encompassed on every side—shut up as if in a fortress, but not half so secure. Our only stockade was the circle of standing trees, and we had no blockhouse to retire to in the event of being wounded. Each man was a sentry, with a *tour* of guard-duty that must be continual!

Our situation was perilous in the extreme. There was no prospect of escape. Our horses had all galloped off. One only remained lying dead by the side of the pond. He had been killed by a bullet, but it came not from the enemy. Hickman had fired the shot. I saw him, and wondered at the time what could be his object. The hunter had his reasons; but it was only afterwards I learned them.

We could hold our ground against five times our number—almost any odds—but how about food?

Thirst we did not fear. At night, we would have relief. Under the cover of night, we could approach the pond.

We had no apprehension about the want of water; but how were we to obtain food? The cones we had gathered had proved but a bite: there were no more within reach; we must yield to hunger—to famine.

We conversed with one another freely, as if face to face. We canvassed our prospects. They were gloomy enough.

How was the affair to end? How were we to be delivered from our perilous situation? These were the questions that passed from mouth to mouth, and occupied the thoughts of all.

Only one plan offered a plausible chance of escape; and that was to hold our position until nightfall, make a sally in the darkness, and fight our way through the lines of our foes. It would be running the gauntlet; a few of us would certainly fall—perhaps many—but some would escape. To stay where we were, was to submit ourselves to certain sacrifice. There was no likelihood of our being rescued by others; no one entertained such a hope. As soon as hunger overcame us, we should be massacred to a man.

Rather than patiently abide such a fate, we resolved, while yet strong, to risk all chances, and cut our way through the midst of the besiegers. Darkness would

favour the attempt, and anxiously we awaited the going down of the sun.

CHAPTER LXXXV.

A BULLET FROM BEHIND.

If we thought the time long, it was not from want of occupation.

During the day, the Indians at intervals renewed their attack; and, notwithstanding all our vigilance, we had another man killed, and several slightly wounded.

In these skirmishes, the savages shewed a determination to get nearer our line, by making their advances from tree to tree. We perfectly understood their object. It was not that they had any design of closing with us, though their numbers might have justified them in doing so. They were now still more numerous than at the beginning of the fight. Another band had arrived upon the ground: we had heard the shout of welcome that hailed their coming.

But even with this accession of strength, they did not design to come to the encounter of short weapons. Their purpose in advancing was different, and we understood it. They had perceived that by getting close to our convex line, they would be near enough to fire upon those on the opposite side of the glade, who, of course, would be exposed to their aim.

To prevent this, therefore, now became our chief object and anxiety, and it was necessary to redouble our vigilance. We did so, regarding with scrutinising glances the trunks behind which we knew the savages were skulking, and eyeing them as keenly as the ferret-hunter watches the burrows of the warren.

They had but slight success in their endeavours to advance. It cost them several of their boldest men; for the moment these essayed to rush forward, the cracks of three or four rifles were certain to be heard; and almost as certain was one of them to deliver its messenger of death.

The Indians soon became tired of attempting this dangerous manœuvre; and, as evening approached, appeared to give up their design, and content themselves by holding us in siege.

We were glad when the sun set, and the twilight came on. It would soon pass, and we should be able to reach the water. The men were maddened with thirst, for they had been suffering from it throughout the whole day.

During the daylight, many would have gone to the water, had they not been restrained by the precepts of the more prudent, and perhaps more effectually by an incident, of which they had all been spectators. One more reckless than the rest had risked the attempt. He had succeeded in reaching the pond, drank to his satisfaction, and was hastening back to his post, when a shot from the savages stretched him dead upon the sward. He was the man last killed, and his lifeless body now lay in the open ground, before the eyes of his comrades. It proved a warning to all; for, despite the torture from thirst, no one cared to repeat the rash experiment.

At length the welcome darkness descended—only a glimmer of gray light lingered in the leaden sky. Men in twos and threes were now seen approaching the pond. Like spectres they moved, silently gliding over the open ground, but in stooping attitudes, and heads bent eagerly forward in the direction of the water. We did not all go at once—though all were alike eager to quench their thirst—but the admonitions of the old hunter had their effect; and the more continent resolved to endure their pangs a little longer, and wait till the others should get back to their posts.

It was prudent we so acted; for at this crisis, the Indians—no doubt suspecting what was going forward

—renewed their firing with fresh energy. Whole volleys were discharged inward, and without aim—the darkness must have hindered an aim—but for all that, the bullets buzzed past our ears like hornets upon their flight.

There was a cry raised that the Indians were closing upon us; and those who had gone to the water rushed rapidly back—some even without staying to taste the much desired water.

During all this time I had remained behind my tree. My black follower had also stuck to his post like a faithful sentinel, as he was. We talked of relieving one another by turns, and Jake insisted that I should 'drink first.' I had partially consented to this arrangement, when the fire of the enemy suddenly reopened.

Like others, we were apprehensive that the savages were about to advance, and well knew the necessity of keeping them back. We agreed to keep our ground for a little longer.

I had 'one eye round the trunk of the tree,' with my rifle raised to the level. I was watching for a flash from the gun of some antagonist, to guide me in my aim; when, all on a sudden, I felt my arm jerked upward, and my rifle shaken out of my grasp.

There was no mystery about it. A bullet had passed through my arm, piercing the muscles that upheld it. I had shewn too much of my shoulder, and was wounded—nothing more.

My first thought was to look to my wound; I felt it distinctly enough, and this enabled me to discover the place. I saw that the ball had passed through the upper part of my right arm, just below the shoulder; and in its further progress had creased the breast of my uniform coat, where its trace was visible in the torn cloth.

There was still light sufficient to enable me to make these observations; and furthermore, that a thick stream of blood was gushing from the wound.

I commenced unbuttoning my coat, the better to get at it. The black was already by my side, rending his shirt into ribbons.

All at once, I heard him uttering an exclamation of surprise, followed by the words:

'Gorramighty! Masser George, dat shot come from ahind!'

'From behind?' I shouted, echoing his words, and once more looking to the wound. Some suspicion of this had already been in my thoughts: I fancied that I had felt the shot from behind.

It had been no fancy. On a more minute examination of the wound, and the torn traces upon the breast of my coat, the direction of the bullet was plainly perceived. Undoubtedly, it had struck me from behind.

'Good God, Jake,' I exclaimed, 'it is so; the Indians have advanced to the other side of the glade—we are lost!'

Under this belief, we both faced towards the opening; when at the moment, as if to confirm us, another bullet whistled past our ears, and struck with a heavy 'thud' into the tree behind which we were kneeling. It had certainly been fired from the other side of the glade: we saw the flash, and heard the report of the gun that had sent it.

What had become of our comrades on that side? Had they abandoned their posts, and permitted the Indians to advance? Were they all by the pond, and thus neglecting their duty?

These were the first conjectures both of Jake and myself.

It was too dark for us to see them under the shadow of the pines, but neither did they appear in the open ground. We were puzzled, and shouted aloud for an explanation.

If there were replies, we heard them not; for at

that moment a wild yell from our savage enemies drowned all other cries, and a sight burst upon our eyes that caused the blood to run cold within us.

Directly in front of the position that Jake and I held, and close to the Indian line, a red flame was seen suddenly springing up from the earth. It rose in successive puffs, each leaping higher and higher, until it had ascended among the tops of the trees. It resembled the flashes of large masses of gunpowder, that had been ignited upon the ground, and such in reality it was. We read the intention at a glance. The Indians were attempting to fire the forest.

Their success was almost instantaneous. As soon as the sulphureous blaze came in contact with the withered fascicles of the pines, the latter caught as though they had been tinder; and with the velocity of projected rockets, the flames shot out in different directions, and danced far above the tops of the tallest trees.

We looked around: on all sides, we beheld a similar spectacle. That wild yell had been the signal for a circle of fire. The glade was encompassed by a wall of flame, red, roaring, and gigantic. The whole forest was on fire.

From all points, the flames appeared closing inward, sweeping the trees as if they had been withered grass, and leaping in long jets high into the heavens.

The smoke now came heavily around us, each moment growing denser as the fire approached, while the heated atmosphere was no longer endurable; already it stifled our breathing.

Destruction stared us in the face, and men shouted in despair; but the roar of the burning pines drowned their voices, and one could not even hear his comrade who was nearest. But their looks told their thoughts, for, before the smoke fell, the glade was lit up with intense brilliancy, and we could see one another with unnatural distinctness. In the faces of all appeared the anxiety of awe.

Not long continued I to share it; too much blood had escaped from my neglected wound. I tried to make into the open ground—as I saw others doing—but before I had advanced two steps from the tree, my limbs tottered beneath me, and I fell fainting to the earth.

CHAPTER LXXVII.

A JURY AMID THE FIRE.

I had a last thought as I fell; it was, that my life had reached its termination—that in a few seconds my body would be embraced by the flames, and I should horribly perish.

The thought drew from me a feeble scream; and with that scream my senses forsook me. I was as senseless as if dead—indeed, so far as sensibility went, I was dead—and had the flames at that moment swept over me, I should not have felt them. In all probability, I might have been burnt to a cinder without enduring further pain.

During the interval of my unconsciousness, I had neither dream nor apparition. By this, I know that my soul must have forsaken its earthly tenement. It may have been hovering above or around, but it was no longer within me. It had separated from my senses, that were all dead.

Dead, but capable of being restored to life; and, happily, a restorative was at hand, with one to administer it.

When consciousness returned, the first perception I had was that I was up to my neck in water. I was in the pond, and in a recumbent position—my limbs and body under the water, with only my head above the surface, resting against the bank. A man was kneeling over me, himself half immersed. My returning senses soon enabled me to tell who it was—the faith-

ful black. He had my pulse in his hand, and was gazing into my features with silent earnestness.

As my open eyes replied to his gaze, he uttered an exclamation of joy, and the words: 'Golly, Mass George! you lib. Thank be to Gorrarnighty, you lib. Keep up ya heart, young masser; yous a gwine to git ober it—cartin yous a gwine to git ober it.'

'I hope so, Jake,' was my reply in a weak voice; but feeble though it was, it roused the faithful fellow into a transport of delight, and he continued to utter his cheering ejaculations.

I was able to raise my head and look around. It was a dread spectacle that on all sides greeted my eyes, and there was plenty of light wherewith to view it.

The forest was still on fire, burning with a continued roar, as of thunder, or a mighty wind, varied with hissing noises and a loud crackling that resembled the platoon-firing of musketry. One might have fancied the fusillade of the Indians, but that was impossible. They must long since have retired before the spreading circle of that all-consuming conflagration.

There was less flame than when I had last looked upon it; and less smoke in the atmosphere. The dry foliage had been suddenly reduced to a cinder, and the twiggy fragments had fallen to the earth, where they lay in a dense bed of glowing embers.

Out of this rose the tall trunks, half stripped of their branches, and all on fire. The crisp scaling bark had caught freely, and the resinous sap-wood was readily yielding to the flames. Many trees had burst in inward, and looked like huge columns of iron heated to redness. The spectacle presented an aspect of the infernal.

The sense of feeling, too, might have suggested fancies of the infernal world. The heat was intense; the atmosphere quivered with the drifting clouds. The hair had crisped upon my head; my skin had the feel of blistering, and the air I inhaled resembled steam from the 'scape-pipe of an engine.

Instinctively, I looked for my comrades. A group of a dozen or more were upon the open ground, near the edge of the pond, but these were not all. There should have been nearer fifty. Where were the others? Had they perished in the flames? Who were they?

Mechanically, I put the question to Jake.

'Thar, masser,' he replied, pointing downward. 'The be all safe yet—ebbery one ob um, I b'lieve.'

I looked across the surface of the pond: slow dozen roundish objects met my glance; they were the heads of my companions.

Like my own, their bodies were submerged, most of them to the very neck. They had thus placed themselves to shun the smoke, as well as the boiling heat.

But the others—they on the bank—why had they not also availed themselves of this cunning protection? Why were they still standing exposed to the fierce heat, and amid the drifting clouds of smoke?

The latter had grown thin and gaunt-like. The forms of the men were seen distinctly through the magnified air in a mist. Like giants, they were standing over the ground, and the guns in their hands appeared of colossal proportions.

Their gestures were abrupt, and their whole bearing showed they were in a state of half-frenzied excitement. It was natural enough, amid the circumstances that surrounded them. I saw they were the principal men of our party. I saw Hinkman and Weatherford among them, both gesticulating freely. No doubt they were debating how we should act.

This was the conjecture I derived from my first glance; but a further survey of the group convinced me I was in error.

It was no deliberation about our future plans. In the lull, between the volleys of the crackling pines, I could hear their voices. They were those of men engaged in deadly dispute—especially the voices of Hickman and Weatherford, that reached the ear in conclamation, both speaking in a tone that betokened some desperate feeling of indignation.

At this moment, the smoke drifting aside, discovered a group still further from the edge of the pond. There were six men in this group, standing in threes; and I perceived that the middle man of each three was tightly grasped by the others. Two of them, then, were prisoners!

Were they Indians? two of our enemies who, amid the confusion of the fire, had strayed into the glade, and been captured?

It was my first thought; but at that instant a jet of flame, shooting upward among the tree-tops, filled the glade with a flood of brilliant light. The group thus illumined, could be seen as distinctly as by the light of day. I was no longer in doubt about the captives; their faces were before me—white and ghastly, as if with fear. Even the red light failed to tinge them with its colour; but, wan as they were, I had no difficulty in recognising them. They were Spence and Williams.

CHAPTER LXXXVIII.

QUICK EXECUTIONERS.

I turned to the black for an explanation, but before he could make reply to my interrogatory, I more than half comprehended the situation.

My own plight admonished me. I remembered my wound; I remembered that I had received it from behind. I remembered that the bullet that struck the tree came from the same quarter. I thought we had been indebted to the savages for the shots; but, no; worse savages—Spence and Williams—were the men who had fired them!

The reflection was awful; the motive, mysterious.

And now returned to my thoughts the occurrences of the preceding night: the conduct of these two fellows in the forest; the suspicious hints thrown out by old Hickman and his comrade; and far beyond the preceding night, other circumstances—still well marked upon my memory—rose freshly before me.

Here again was the hand of Arens Ringgold. O God! to think that this arch-monster—

'Dar only a tryin' them two daam raskell,' said Jake, in reply to the interrogatory I had put; 'dat's what they am 'bout, Mass George—dat's all.'

'Who?' I asked mechanically, for I already knew who were meant by the 'two daam raskell.'

'Lor, Mass George, doant you see um ober yonder? Golly! thar as white as peeled punkins—Spence an' Williams. It war them that shot you, an' no Ind-i-ens arter all. I know'd dat from the fust, an' I tol' Mass Hickman de same; but Mass Hickman 'clare he see um for hisself, an' so too Mass Weatherford. Boaf seed um fire tha two shots. Thar a tryin' on 'em for tha lives—dat's what tha am adoin'.'

With strange interest I once more turned my eyes outward, and gazed, first at one group, then the other. The fire was now making less noise, the sap-wood having nearly burnt out; and the detonations, caused by the escaping of the pent air from its cellular cavities, had grown less frequent. Voices could be heard over the glade, and to those of the improvised jury I listened attentively. I perceived that a dispute was going on. The jurors were not agreed upon their verdict; some advocating the immediate death of the prisoners; while others, averse to such prompt punishment, were for keeping them until further inquiry should be made into their conduct.

There were some who could not credit their guilt;

the deed was too monstrous and improbable; under what motive could they have committed it? at such a time, too, with their own lives in direct jeopardy?

'Ne'er a bit o' jeppurdy,' exclaimed Hickman, in reply to the interrogatory—'ne'er a bit o' jeppurdy. Thar hain't been a shot fired at eyther on 'em this hul day. I tell ye, fellers, thar's a unnerstannin' atween 'em an' the Indyens. Thar no better'n spies, an' thar last night's work proves it. 'Twar all bamfoozle about thar gittin' lost; 'em fellers git lost adeed! Both on 'em knows these hyar wuds as well as the anymals thet lives in 'em. Thuv both been hyar many's the time, an' a wheen too often, I reck'n. Lost! Wagh! did yez iver heer o' a 'coon gittin' lost?'

Some one made reply. I did not hear what was said, but the voice of the hunter again sounded distinct and clear.

'Ye palaver about thar motive. I s'pose you mean thar reezuns for sich a bloody bizness? Them, I acknuldge, ain't clar, but I hev my sespicious too. I ain't a gwine to say who or what. Thar's some things as mout be, an' thar's some as moutn't; but I've seed queer doin's in these last five yeern; an' I've heern o' others, an' if what I've heern bes true—what I've seed I know to be—then I tell ye, fellers, thar's a bigger than eyther o' thesen at the bottom o' the hul bizness—that's what thar be.'

'But do you really say you saw them fire in that direction? Are you sure of that?'

This inquiry was put by a tall man, who stood in the midst of the disputing party—a man of advanced age, and of somewhat severe, though venerable aspect. I knew him as one of our neighbours in the settlement—an extensive planter—who had some intercourse with my uncle, and out of friendship for our family, had joined the pursuit.

'Sure!' echoed the old hunter, with emphasis, and not without some show of indignation. 'Didn't me an' Jim Weatherford see 'em wi' our own two eyes? an' thar good enough, I reck'n, to watch sich varmint as 'em. We'd been a watchin' 'em all day, for we know'd thar war somethin' ugly afoot. We seed 'em both fire acrost the gleeed, an' sight plum-centre at young Randolph. Beside, the black himself sez that the two shots comed that away. What more proof kin you want?'

At this moment, I heard a voice by my side. It was that of Jake calling out to the crowd.

'Mass Hickman,' cried he, 'if dey want more proof, I b'lieve dis nigra can gib it. One ob de bullets miss young massr, an' stuck in tha tree. Yonner's tha berry tree itseff we wa behind; it ain't burn yet; it ain't been afire. Maybe, gen'l'm'n, you mout find tha bullet thar still; you tell whose gunl he 'longs to?'

The suggestion was instantly adopted. Several men ran towards the tree behind which Jake and I had held post, and which, with a few others near it, for some reason or other, had escaped the flames, and still stood with trunks black and unscathed, in front of the conflagration. Jake went with the rest, and pointed out the spot.

The bark was scrutinised, the shot-hole found, and the leaden witness carefully picked out. It was still in its globe shape, slightly torn by the grooves of the barrel. It was a rifle-bullet, and one of the very largest size. It was known that Spence carried a piece of large calibre. The guns of all the party were brought forward, and their measure taken: the bullet would enter the barrel of no other rifle save that of Spence.

Their guilt was evident; the verdict was no longer delayed. It was unanimous that the prisoners should die.

'An' let 'em die like dogs, as they are,' cried Hickman, indignantly raising his voice, and at the same

time bringing his piece to the level. 'Now, Jim Weatherford, look to yer sights! Let 'em go thar, fellows, an' take yerselves out o' the way. We'll gie 'em a chance for thar cussed lives. They may take to yonner trees if they like, an' git 'customed to it, for they'll be in a hotter place than thet afore long. Let 'em go—let 'em go, I say; or, by the 'tarnal, I'll fire into the middle o' ye!'

The men who had hold of the prisoners perceiving the threatening attitude of the hunter, and fearing that he might make good his words, suddenly dropped their charge, and ran back towards the group of jurors.

The two wretches appeared bewildered. Terror seemed to hold them speechless and fast, as if bound to the spot. Neither made an effort to leave the ground. Perhaps the complete impossibility of such a thing was apparent to them, and prostrated all power to make the attempt. They could not have escaped from the glade. Their taking to the trees was only a mockery of the indignant hunter; in ten seconds they would have been roasted among the blazing branches.

It was a moment of breathless suspense. Only one voice was heard—that of Hickman.

'Now, Jim, you Spence; leave tother to me.'

This was said in a hurried undertone; and the words were scarce uttered as the two rifles cracked simultaneously.

The smoke drifting aside, disclosed the deadly effect of the shot. The execution was over. The worthless renegades had ceased to live.

PEGASUS IN HARNESS.

FROM THE GERMAN.

To a horse-fair—Newmarket, say, the name,
Where other wares were interchanged as well,
Once on a time a starving Poet came,
Urged by stern want, his Pegasus to sell.

Loud neighed the hippogriff, and proudly pranced
In splendid style before the astonished crowd;
All stood stock-still to gaze, as if entranced.
'The princely animal!' some cried aloud;
'What thousand pities that that form so slim
Should be disfigured by those odious wings;
The finest carriage else were meet for him—
'Tis said that from the noblest race he springs;
But in the air what Whip his seat could hold?'
So on the venture none would risk his gold.

At length, a country farmer courage found.
'The wings, 'tis true, serve for no use,' quoth he;
'But we may have them either clipt or bound,
And then for draught the horse would suited be.
Come! I will on him venture twenty pound.'
The owner, overjoyed, the offer heard;
Eager to sell his goods without delay,
The bargain strikes—'I take you at your word.'
So Hodge trots gaily on his prize away.

The noble creature straight in harness placed,
The unaccustomed burden hardly feels,
When off he starts in wildly flying haste,
By noble rage incensed. The carriage reels,
And sudden, on a precipice's brink,
Is overthrown. 'So, ho!' cries Hodge; 'I think
Experience makes men wise; no more I must
Alone this frantic beast with wheel-work trust.
But as to-morrow passengers I take,
The sprightly thing will a fine leader make;
Two other nags he'll spare me, not a doubt,
And this wild frenzy will with years wear out.'

At first all prospers well—the light-winged steed
Urges his comrades on; the carriage flies
Swiftly as with an arrow's speed,
But soon forsakes the sure and beaten track;
No shouts avail—no rein can hold him back;
Like wildness seizes all, in frantic guise

O'er bog and fen, through hedge and field they dash,
Until the shattered coach, with a loud crash,
Amidst the traveller's cries, stops short at last,
And on a steep ascent the wheels stick fast.

Poor Hodge exclaims, with thoughtful mien:
'We have not yet found out the way;
'Twill never answer thus: but stay,
Another sort of trial shall be seen;
We'll see what meagre fare and work will do,
The foolish creature's spirit to subdue.'

The trial made—ere many days are past,
The beauteous animal declines,
And soon to a mere shadow pines.
Cries Hodge: 'I've found it out at last.
Here, quick! come yoke him for me now,
Joined with my strongest ox in yonder plough.'

No sooner said than done—behold:
In ludicrous conjunction by one tether
The Ox and Wingèd Courser linked together.
Unwilling steps the Griffin bold,
But strains his last remaining might,
Eager to take his wonted flight.
In vain—his neighbour plods with steady pace;
Phœbus' bright steed must to the Ox give place.

With constant opposition worn at length,
And bowed with grief, the steed of godlike birth,
With trembling limbs and failing strength
Sinks, and lies prostrate on the earth.
'Accursed beast!' breaks forth the angry clown
(By heavy-showering blows his vengeance shews),
'E'en for the plough thou art too weak and thin.
Thy master was a rogue, and took me in.'

While still the swinging lash his wrath betrays,
A joyous youth with light elastic tread
Comes smiling on—a wreath of golden bays,
With his fair locks entwined, adorns his head;
The sounding lyre is in his practised hand.
'Whither with such a wond'rous pair, my friend?'
He from a distance to the peasant cries.
'The bird and ox linked in one band,
So strange a team must every one surprise,
I prithee for a space thy poor horse lend,
And for brief trial trust him unto me;
But be prepared—a marvel shalt thou see.'

The hippogriff is speedily unbound—
Upon his back the laughing youngster springs;
The master's steadfast hand he scarce has found,
When, champing at the bit, he spreads his wings;
With lightnings flashing from his soul-lit eyes,
See him, a thing regenerate, arise
King-like, a very spirit, or a god,
And rushing as a storm, he waves abroad
His pomp of pinion—now in heavenward flight,
Snorting with joy he darts, begins to soar,
And ere the eye can follow, seen no more—
Floating, has reached the empyrean height.

L'ENVOI.

The Pegasus that here you view,
Not fed on rich Castalian dew;
But travel-wearied, and foot-lame,
Will prove, I fear, ignobly tame.
And all unlike the noble steed
Of which, in German, you may read
(That scion of immortal race
Poets have ever loved to trace),
This poor, constrained, and awkward creature,
Scarce seems divine in any feature.

Has Schiller's Courser, then, been overrated?
No; but he verily hath been translated.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 233.

SATURDAY, JUNE 19, 1858.

PRICE 1½d.

FAVOURS RETURNED.

An interesting meeting was lately held in a well-known reading-room in the northern part of the metropolis. The persons composing it were all of them working-people, and the object professedly was to form a society for the purpose of sending missionaries among the middle and upper classes of the community. John Duggin, a sailcloth-worker, occupied the chair, and professed his readiness to give all needful explanations. He said it was a notorious fact that, for a number of years past, the middle and upper classes had taken a great interest in the morals of the lower, trying to abate their habits of intemperance, to introduce knowledge amongst them, and to get their children trained up in the way they should go. This was a very obliging thing on the part of the rich towards the poor; and the poor felt duly grateful for it, as would by and by be seen. Now things were so far changed, that those who had once been called the better class of people, were more in need of moral improvement than ever their inferiors had been; and it became the duty of their poorer brethren to reciprocate their former good deeds. He would not enlarge upon the matter, for he knew there were abler men than himself prepared to address them upon it; he would content himself in the meantime with calling upon Mr Hobson to move the first resolution.

Mr Hobson, whom we understand to be a costermonger, accordingly rose and said that he was happy to take part in this movement, as he considered it pressingly needed. At all times, he observed, the lying advertisements of shopkeepers, and their many tricks to secure custom, had been matter of scandal. How to inveigle simple people, especially of the gentler sex—how to pass off inferior goods upon them—how to make them buy more than they wanted or could afford—how, in short, to pillage them, had, from the earliest ages, been the leading purposes of many belonging to that class. But all of these practices were innocent in comparison with others which late years had revealed. It had been found, by Dr Hassall and others, on strictly scientific grounds, that a great proportion of those dealing in articles of food were in the habit of adulterating them to a serious extent, careless though they should thus derange the stomachs and ruin the health of their customers, so that they should be able to put a little more money into their own pockets. To such an extent had this system been carried, that it was impossible to be sure of the genuineness of a single article of food or drink, whatever might be the price

paid for it. The working-classes were great sufferers by this system; and it was a strange but an actual anomaly of our age, that a serious brewer might be subscribing to ragged schools and churches with one hand, while cheating the ragged out of their money with the other. To pass from these matters—he would proceed to advert to various delinquencies of the middle classes which had been brought to light within the last two or three years. First came the trial of Paul, Strachan, and Bates for appropriation of the property of others intrusted to them—the first of the trio being a man who had not only been, to all outward appearance, a respectable man, but one who took a lead in all religious plans for the benefit of humbler people. Next, we had the Royal British Bank directors and the directors of the Eastern Banking Corporation establishing and keeping up a fraudulent system for the reception of poor people's money, in order that they might use it for their own purposes. Still, all these iniquities were insignificant in comparison with those which were revealed by the crisis of November 1857. Then did the mercantile community shine forth in what he feared he must describe as its true colours. Banks were found to have been kept up for years in good appearances and with large dividends, which had in reality lost all their capital. Manufacturing and commercial concerns had been started without capital, had been constantly losing from the beginning, and yet were kept up in fair show by assistance from banks, till it was no longer possible, and a crash ensued. Thus selfish adventurism had been encouraged, honest trade had been made nearly impossible, and thousands of innocent simple people had been deprived of their all. It was evident that, while the middle classes were accustomed to consider themselves as a highly moral community, as indeed the principal depositaries of the virtues in this country, the love of gain had eaten into them as a great corruption, and was threatening to swamp all truth and honesty amongst them, unless a remedy were provided. He (Mr Hobson) therefore felt pleased in moving the first resolution, that it has become eminently necessary for the working-classes to adopt measures for checking, as far as possible, the rapid deterioration of morals which cupidity is evidently producing amongst those engaged in commerce. The resolution was duly seconded, and carried without a dissentient voice.

Mr Jones, a second-hand bookseller, rising to move the second resolution, told the meeting that he had had some opportunities of observing the domestic habits of the people who called themselves genteel, as he had been a servant in several respectable situations.

He had become fully convinced that the prompting cause of that eagerness for riches which the preceding speaker so much deplored, was the prevalence of luxurious habits amongst those in fault. A man was thought nothing of unless he lived in a fine house, and entertained his friends with rich food and costly wines. His wife and daughters must dress elegantly, and partake of expensive amusements. Doing nothing whatever, they were a cause of outlay to their husband and father, without contributing anything to the general stock. He was thus obliged to devote himself, body and soul, to the making of money. Money must be had by whatever means. Could it be wondered at if, in these circumstances, many foul and fraudulent things were done? Sad to say, the luxuries and fineries on which the money was spent, gave little real enjoyment—often none at all—might rather be said to create inconvenience and bring pain, than do any real good. They ministered chiefly to vanity. He could testify from his own observation, that the dozen people sitting at a superb dinner which lasted two hours, were generally very dull and languid. You rarely heard a hearty laugh among them. Such a thing would indeed be considered improper. And after the entertainment was over, and the guests gone home, the whole affair was forgotten, and the party immediately became as much strangers to each other as ever. The truth is, fineness banishes friendliness, and you had to stay among plain people in the country, if you wished that anybody should care for you. One great object of the ambition of the people he was speaking of was to keep a carriage of their own and drive in the parks. But it was not for the sake of any enjoyment they had in carriage-driving in those places. Look in their dull inanimate faces, as they pass along, and you must see there is no enjoyment in it. It was all for the sake of vanity. The only thing relished was the reflection that they must be looked on as people of some importance; otherwise they could not afford to keep the carriage. Now it was clear that these were all contemptible objects, utterly degrading to those who cherished them; that there could be no true moral dignity, and no true Christian virtue, where the only things thought of were how to make fine shows in the eyes of one's neighbours. It appeared that even when these people professed to take part in plans for the improvement of the poor, it was in the spirit of vanity, rather than that of benevolence. They wished to appear in the position of people who could patronise the poor. They professed all the time to be zealous supporters of religion, and particularly anxious to make the poor religious. But true religion was far more wanting among themselves than among the poor; and a mission from the poor among the rich, or those who make riches their idol, was now the thing needful. When Christianity began, it was a preaching by the poor to the rich. Its founder had not whereon to lay his head. Its first apostles were working-men. The voice raised by them thrills through society to this hour. Suppose Dives, Nicodemus, and the rich young man had tried to make a similar religious impression on their fellow-citizens, would they have succeeded? The question requires no answer. 'Now, seeing how given up these money-hunting people are to all sorts of vanities, and how in them, owing to that base idolatry, all the nobler traits of humanity are in a manner lost, I think it becomes us,' said Mr Jones, 'that we who are unembarrassed with the world's possessions should bestir ourselves to go among them and try to recall them to a sense of the higher aims of life. Let us hold up before them an unflattering account of their iniquitous practices. Let us denounce the luxuries and the vanities for whose sake they strain to get wealth. Let us endeavour to impress upon them the

moral grandeur of the honest man who is contented with moderate things, and the high gratifications which wait upon frugal contentment. There are amongst us, I trust, abundance of men both able and willing to go forth upon this mission, and it is men, and not funds, that are wanting. I therefore with all confidence move, That a society be formed for the sending out of missionaries among the upper classes.' The motion was carried by acclamation.

Mr Smith, who described himself as a journeyman carpenter, supporting a wife and six children on thirty shillings a week, moved for the appointment of a committee to carry out the objects of the meeting. He said he had long felt how unsatisfactory was the condition of the upper class of people in this country. There were strong moral agencies, or what professed to be such, at work for the maintenance of sound morality in the community; but it was only too manifest that these had little effect upon the class in question. The universal devotion to vanity amongst that class, and the soul-corrupting chase of riches wherewith to gratify their vanity, had been depicted by the preceding speaker. The humbler classes, being comparatively exempt from these degrading influences, might well assume the duty of seeking to place their neighbours upon a higher moral platform—not, he trusted, in a pharisaic, but in a truly philanthropic spirit. He could not doubt that, both by their preachings on the meanness of all mere wealth-seeking, and by the example they held forth of contentment with their own humble gains, they would in time accomplish a reform in their better-housed and better-clad brethren. There was one consequence of mammon-worship in the middle and upper classes which he especially deplored, and that was the difficulty they professed to feel in regard to matrimony. Marriage was an institution notably favourable to virtue. Working-men generally married early, and so promoted at once their happiness and their virtue. But what a working-man could do on one hundred a year or less, a mercantile man or a gentleman professed to be unable to do on three! This was of course a confession that his class prefers fine outward appearances to the reality of virtue, and that he, as a member of the class, must yield to the rule. The consequences were deplorable. Every honest working-man must grieve to think that, while he dares to be poor with honest marriage, there are thousands upon thousands of his fellow-men—men of perhaps good education—men who go to church—men who are perhaps very good fellows in their hearts—so far given up to a corrupt idea of life, that they deliberately reject this good course. If anything more than another could demonstrate the pressing call there was for a mission to the well-off, it was surely this. He trusted in a few years to see some telling effects upon this plague-spot of refined society; but he believed it could not be till men had been brought to see that there are better things in this world than riches, and the shows which riches enable men to make. The whole of these errors, indeed, were inwrought with each other as part of one system. Men were a bane to women, instead of a blessing, almost solely because they prefer riches to honesty, and show to substance. Whenever we can open their eyes to the true value of money in a just relation to wants, we may expect to see the gentler and more helpless portion of our species treated more generally in a becoming manner, and the happiness of society proportionately advanced.

The meeting now separated, its objects being so far accomplished. An operative bookbinder, who reports it to us, states that there was an appearance of much good feeling throughout. The people present seemed deeply sensible of the sad case of their brethren of the middle and upper classes, and determined to

make a strenuous effort for the bringing about of a reform. The speakers delivered themselves, as may be seen, in good language, and seemed anxious to avoid all expressions calculated to raise feelings of irritation. How far the designed mission will succeed in checking the corrupting agencies now so conspicuous in operation throughout society, remains to be seen. The mission, we may say, has our best wishes, and may reckon upon our steady support.

TURKISH RAILWAYS.

It is impossible to doubt that of all the levers of modern civilisation, the railway is the greatest. It has already revolutionised the habits of the old countries of Europe; and although it was once supposed to be suitable only for countries already densely populated, and having an established goods and passenger traffic, we find in the United States that the railway actually precedes population, and stretches through forests and prairies, to pioneer the settlements of man. The railway proprietor in this way becomes a landholder of extraordinary magnitude. He possesses not merely a line of rail, and the land it stands on, but a broad band of the earth's surface, which, being intersected by locomotive facilities, may be turned at once into farming and building lots of the most valuable description. The company buys a waste, having no communication with the civilised world, and in a short space of time re-sells this land at a value enormously enhanced by the communication which annually adds thousands to the population, and takes to market produce that increases in a geometrical ratio. It is true that in America, through competing lines and financial jobbing, the results do not always answer the expectations of the projectors. But if we set aside these illegitimate influences, the principle is undoubtedly sound in the case of a line that goes through a rich soil, and is not beset with engineering difficulties.

Turkish railways occupy a middle position between the system of Europe, which subserves compact populations, and the system of the western parts of America, which entirely precedes them. In Turkey, there are towns, and some of considerable size; but on the intermediate parts of the proposed lines, from the scanty population, there would be little or no local personal traffic; recourse, therefore, must be had to the American system, of the railway company becoming a landholder on a large scale, so as to absorb to the credit-side of the enterprise as much as possible of the prospective rise in the value of the land adjoining the railway. Passenger-traffic will thus be drawn to the railway by increased settlement on the line. But the great revenue will be from the valuable agricultural and mineral products, which at present have no outlet in consequence of the enormous price of transport on mule or camel back.

The political importance of railways to Turkey can scarcely be overestimated. One great cause of the oppression and misgovernment of the internal parts of this empire, which are removed from the observation of the diplomatic and consular corps, is the distance and inaccessibility of these satrapships. This will all be altered under a system of railway reticulation. With the electric wire extending from one country to another, it becomes like one town. Everybody is in presence of public opinion, and no population can remain semi-barbarous that habitually associates with others more civilised in a railway-train. We have seen the effect of the overland transit through Egypt. In the beginning of this century, it was dangerous to go any distance from the walls of an Egyptian town. Even under the vigorous and intelligent despotism of Mohammed Ali, a journey to Suez was not unattended with danger. But from the moment the transit was

fairly established, the Arabs of the line became altered men, and instead of their hand being against every man, and every man's hand against them, their constant anxiety was to get the well-remunerated employment the British agents could give them.

The first executed of the railways of the Ottoman empire is from Alexandria to Suez; and this reminds us that Turkish railways are important to us, not merely in relation to the trade of our Turkish merchants with the interior, but in relation to our connection with India. What may be accomplished by large steamers like the *Leviathan*, in course of time, we cannot, of course, predict; and it will require very extraordinary speed in vessels doubling the Cape of Good Hope to make up the difference of the more direct overland routes: for it must be remembered that there are much shorter ways of getting to India than by Suez: such, for instance, is the projected line of the Euphrates Valley, which proceeds by Antioch to Bagdad and Bassorah. The celebrated Euphrates expedition, under General Chesney, did not result in introducing the regular navigation of this river for goods and passenger traffic to India; the Egyptian being found to be the preferable route (although not so direct), in consequence of the easy access to the port of Alexandria, the facilities offered by the Mahmoudieh canal, the steam-navigation of the Nile, and the security of the land-route from Cairo to Suez. On the other hand, by the Euphrates route, there was a tedious land-journey, and considerable obstructions in the rocks and shallows, except during a few weeks in spring, in consequence of the melting of the snows of the Taurus. But since the introduction of railways, and of vessels constructed by Messrs Laird, of a light draught of water, the Euphrates Valley line has attracted general attention; and a company has been formed to construct a railway from the mouth of the Orontes to Taber Castle, on the Euphrates, passing very close to the city of Aleppo, and thus providing for a considerable local traffic; for Aleppo has 70,000 inhabitants, and a large trade of exported produce, and import of British manufactures, which is at present carried on on mule and camel back.

When this first short railway is completed, steamers of light draught will be introduced for some years, in order to carry on the communication to Bassorah, at the head of the Persian Gulf, until the whole line of railway is completed. The total line of the railway from the Mediterranean to the Persian Gulf would be 1200 miles; it is therefore only to a perhaps distant futurity we may look for the completion of the whole line. But once arrived at the Euphrates, the whole track through Mesopotamia to Bagdad and Bassorah is a dead flat, traversing the richest part of the ancient Babylonian empire. Bagdad itself is a large city, carrying on a considerable trade with the western parts of Persia; and there can be no doubt that many light goods would be transported by rail. When all is completed, the transit from Bombay to Malta, which, by the Red Sea, takes twenty-one days, could be accomplished in fourteen.

The great anxiety of the company is to complete, in as short a space of time as possible, the first portion of the railway, beginning with Suéidiah. The Bay of Antioch is here very spacious, and free from rocks, the holding-ground good; only a small mole is required, on account of the south-easterly winds. The learned Dr Holt Yates, formerly secretary of the Syro-Egyptian Society, writes of this place as follows: "The importance of Suéidiah, in a political and commercial point of view, cannot be doubted. Situated at the very gates of Asia Minor, in a fine bay at the mouth of a large river, which communicates with an extensive fertile country, abounding in silk, grain, and fruits, flocks and herds, sheltered by lofty mountains, which are well wooded, and shew indications of coal, copper,

and iron ore, with plenty of lime and stone for building, an abundance of running water, and a fine climate—it attracted the attention of the ancient Romans, who, as long as they held possession of Syria, made Antioch the seat of government."

Proceeding northward and westward round the coast of Asia Minor, we come to Smyrna, the great port of this division of the Ottoman Empire, towards the Mediterranean. Formerly, Smyrna was the place of export of caravan-produce, and of the import of manufactures which found their way to Persia. But the opening up of the trade of Trebizonde caused this part of the trade of Smyrna to decline. For many years, no goods have ever gone from England to Persia by the Smyrna caravans. All find their way by Trebizonde and Erzeroum. But there is a very large local export trade in figs, grain, and dye-stuffs for manufactures. Aidin is in the interior, the centre of this large trade; and a railway has been subscribed for, and, we believe, commenced, between the port and this important internal entrepôt of western Asia Minor. Smyrna itself is a large city, having a considerable corps of British merchants, as well as those of the other countries bordering the Mediterranean, particularly French from Marseille, Italians from Genoa and Leghorn, and Austrians from Trieste.

Passing round to the north of Asia Minor, we come to Samsooun, and are again reminded that at no distant period Asia Minor, rather than Egypt, is the gate of India; and that when the lines across Moldavia and Galicia are finished, that by Samsooun to Diarbekir and Bagdad is the shortest of all possible routes to India, not excepting that of the Euphrates Valley.

This is no chimera, for the Porte has just conceded to Englishmen of the highest respectability the power to construct a railway from Samsooun to Tokat and Sivas, the latter towns being not very far distant from Diarbekir, the first important town in the vale of the Tigris, beyond which all is plain to Mosul and Bagdad; in fact, all the Lower Tigris is a dead flat. This line does not go through wastes or regions of desert, but a rich country, with several very large towns, where valuable productions are most abundant, and wanting only carriage to a port, instead of the slow, tedious, and expensive transport on the backs of animals. Tokat has inexhaustible copper-mines, which, for want of transport and other facilities, are not sufficiently utilised. Sivas is the centre of a district which produces in abundance most of those articles so extensively exported from Asia Minor to the manufacturing districts of England, in addition to fruits and grains. So that for this first stage of what we may call the direct India railway, there cannot fail to be an enormous local traffic. 'But how,' it is asked, 'are we to get to Samsooun most conveniently?' We answer, by rail from Calais to Galatz. This line is already completed across Germany and through the greater part of Galicia. The Moldavian line across a dead flat is all that would be wanting, on the completion of the line to Sivas, to make the communication by rail and steam uninterrupted. We believe it is not the intention of those who have received this valuable concession, to bring it into the money-market in its present state; but as the Porte has guaranteed 7 per cent, and engaged to take up one-third of the shares, we look upon the project as certain to be carried out. We think Turkey has acted wisely in the exercise of this liberality. The future prosperity of the Ottoman Empire is more likely to be found in the opening up of these productive internal regions, than by any other measures that can possibly be devised.

Until the ports of Turkey are cheaply accessible to the mineral and agricultural productions of the interior, the free trade she has possessed from

time immemorial loses half its value. This great principle is in Turkey like a fire without fuel, or a noble human faculty torpid from inadequate exercise, or inefficient from inadequate means.

We now pass from Asia to Europe, where we find several projects of railway, the most comprehensive of which is no doubt the Grand Trunk Railway from Constantinople to Belgrade *via* Adrianople. But this line may ultimately be executed, we look on as highly probable, because it is the ancient Roman line from the eastern capital to Mœsia. Adrianople, Philippopolis, Sophia, and Belgrade, are all very little out of the straight line to Vienna. But such a line can be executed only by a company of colossal capital, in consequence of its great extent, not only across the rich and level plains of Roumelia, but also through the gorges of the Taurus and its spurs, that extend all the way from Tatar-Bazardjik to Kism, on the borders of Servia; in all which regions much tunnelling would be requisite.

A less expensive project is the line from Rutchuk, the large grain-emporium on the Lower Danube, to Enos, on the Mediterranean below the Dardanelles—not going over the Balkan, but round it on the shores of the Black Sea; and a still shorter line is from Rutchuk to Varna. But both these schemes are as yet only projects. In the case of the railway from Kustendji to Czernavoda, which cuts off the great tongue formed by Lower Bulgaria or the Dobruja, the capital has already been subscribed, and the preliminary works actually begun. If any one looks at the map of this part of Turkey in Europe, it will be seen that the Danube, instead of continuing its easterly course to the Black Sea, makes a great detour to the north, and enters it by several numbered channels, the entrance to which, from the sea, is practicable only to vessels of small tonnage, and to these only in fair weather. At one time, a depth of fourteen feet was maintained over the bar by artificial means, but latterly it has not exceeded eleven feet, the width being five hundred yards. Yet the trade of Galatz and Ibraila, the former the port of Moldavia, and the latter of Wallachia, has increased fifteenfold between 1833 and 1853. Tim, from the small and uncertain depth of water, and the difficulties of the navigation through the channels of the delta, the trade has been confined to vessels of very light draught, which is seriously obstructive of much direct commerce with the west of Europe, which large vessels only can be profitably employed. The consequence is that the trade is very much confined to Levantine coasting-vessels of small tonnage. Captain Spratt has paid especial attention to the mouths of the Danube, and has produced new charts of the Sulina and St George mouths, and would appear from communications with him, and study on the spot, that it would take an enormous sum to establish a depth on the bar of twenty feet, so as to enable vessels of 800 tons to cross it at all times.

A very large proportion of the foreign grain imported into England now comes from those Danubian principalities, which are so much before the public in relation to political matters, which we will not now touch upon. But although the trade has increased so enormously, the internal arrangements for conducting it are still of a very rude character. From the western districts of Wallachia, the grain is sent by land to Kalafat, or down the Aluta, which separates Great from Little Wallachia, to the mouth of the river, and thence by barges to Ibraila. From Constantia Wallachia, Moldavia, and the interior of Bulgaria, the grain is brought mostly in carts to the Danube. The merchants employ agents to buy it in the country direct from the growers, and bring it to market at all risks, involving a great deal of loss.

delay, fraud, and wrangling. There is, therefore, a great want of a cheap and commodious conveyance to a Black Sea port; and it has been found that by clearing out the ancient port of Constantia, called Kustendji, on the Black Sea, and making a railway to Tchernavoda, on the Danube, the tongue of the Dobrudscha would be cut off, a great circuit saved, and the dangerous, difficult, and inconvenient navigation of the mouths would be avoided.

The main object of the proposed port and railway is to open the Black Sea to the products of the Danubian provinces more effectually, and thereby facilitate the trade with Western Europe. But a second object is to induce a return of population into Eastern Bulgaria, which is naturally one of the richest districts of Europe for the production of grain and the rearing of sheep, oxen, and horses.

Kustendji, under the name of Constantia, was an important place, and had a large harbour in ancient times. The ruins of ancient temples, the remains of ancient moles and quays still visible, prove this. And, certainly, in whatever point of view it be regarded, there can scarcely be imagined a more favourable site for a commercial city. Kustendji is backed by a vast extent of country, perfectly open, but with a great depth of the richest soil, producing, whenever cultivated, crops of the finest grain. The surrounding country is high, and peculiarly healthy; fever is rare; and the sheep, horses, and oxen, are fat and fine. The curse of the country has been war. The mouths of the Danube being in the hands of the Russians, the Danube below Silistria being undefended by any fortress of importance, and the coast having no safe harbour, this territory has always been overrun by the Russian forces at their first advance against Turkey, and made the prey of contending armies. A promontory running into the sea forms a natural protection from the north and north-east winds for a large area of water, which may, by dredging and enclosure, be converted, at a moderate expense, into a safe and commodious harbour, capable of receiving vessels of large tonnage.

Captain Spratt has, since the reconnaissance made by him for the generals of the allies in July 1854, given much attention to the subject of this port and communication with the Danube; and he is of opinion that, with a north-east entrance, it is accessible as a harbour of refuge in any wind. A breakwater will be carried out four hundred yards. It is therefore considered that it will have six times the accommodation of Odessa; with a deeper entrance than that port, and a better exit for the despatch of business. The importance of this will appear when we mention, that in consequence of the troublesome navigation of the mouths of the Danube, freights to Odessa are generally one-third less than to Galatz. The position of Kustendji has the advantage over Odessa of being at all times free from ice in winter, while it is two hundred sea-miles nearer to the Bosphorus, and these two hundred miles are of dangerous navigation.

With regard to the country to be passed over, we may mention that the Dobrudscha consists of five thousand square miles of rich soil, having a porous substratum generally of the coral rag and chalk formation. The general elevation of the country is about 300 feet above the level of the sea. At the northern extremity, however, the old formations appear, and have heaved up the younger formations, forming a fine range of mountains, rising, towards the extreme north, to an elevation of about 2500 feet, covered at their base, on the northern slopes, with fine forests. This vast extent of country is beautifully, but gently undulating, and is besides intersected and indented by numerous small valleys and dales, singularly tortuous and indeterminate in direction, but

opening ultimately into a few large valleys running to the Danube, and to lakes bordering on the Black Sea. The valleys have no streams to water them. Powerful springs rise at the head of some; but the rivulet thus formed dies almost at its source—is absorbed, forms a bit of green marsh, a mud-pool, and is lost. Very rarely is it that water runs on the face of the country. No ravines, no rocky or pebbly beds, worn by the rush of waters. At most are to be found some deep furrows on the steeper parts of the slopes, to shew that water does fall faster than the soil can absorb it. The porous substratum of coral rag and chalk absorbs the rain not retained by the deep free soil—a soil which resembles the finest garden-mould—and gives it off in springs, which gather in lakes towards the Danube and the Black Sea, and little above their level, or are tapped by the wells of its inhabitants. The soil is of amazing depth; and grain-crops and grass of the finest quality grow on parcels scattered over the length and breadth of the land, produced without manure, under the most primitive methods of culture. Onions, beans, cabbages, seem to grow luxuriantly wherever sown. The oak, the wild-pear, the ash, the plane, are still to be found, though not of great dimensions, in natural forests of fine trees.

The railway is proposed to be carried along a line of lakes, which are, in fact, back-waters of the Danube; and the line will be as much as possible along the margin of these lakes, on an embankment from four to six feet in height; and we learn by the report of the company just issued, that accounts have been received from their engineers that the banking of the Danube was begun on the 22d of October last; that Turkish commissioners, appointed for the purpose, have marked out the land reserved by government for fortifications. Nearly all the land on the line has been ascertained to be imperial property.

Such are the railways now projected, or begun, in the Ottoman Empire. That others will follow, we cannot doubt; for the government of that country is most anxious that all the districts of the interior, capable of large production, should be put in communication with the coast. From the period of the Greek revolution, down to the termination of the Crimean war, Turkey, owing to innumerable domestic revolts, foreign war, and diplomatic crises, has never been out of hot water. A new period is now opening up for her; and we look forward to the time when a large amount of British capital will be securely vested in Turkish railways.

SOMETHING ON MY MIND.

DARK masses of my threatening fellow-creatures, cloaked and cowed; chosen assassins equipped with noiseless goloshes and daggers diminishing to a point, wherefrom drips a gout of gore; an executioner with a half-mask and a chopper, with its edge turned towards me; vague and unknown shapes following, following, with a deadly unswerving purpose, whithersoever I take my frightened way; a thousand strangers with uplifted armed right hands, exclaiming together, artistically, and in the pauses of slow music: 'We swear, we swear,' and doing it; half-a-dozen of intimate friends striking at my breast with a curious and varied collection of weapons, from an overwhelming sense of duty, and averting their looks for pity's sake; secret conclaves setting down my name in blood, with a variety of other dismal pictures selected from the haunted chambers of imagination, had been presented to me in dreams for months. I was rendered miserable, through having been made a free-mason, with the terror of carrying about with me so

tremendous a secret. I felt that I was fated to be the unhappy wretch who should betray that which had been held sacred by multitudes for more than a thousand years. Nor was this idea altogether without grounds; for to so great a pitch of nervousness had I arrived, that I was continually whispering the matter confidentially to myself, and then, in the belief that I had spoken aloud, looking horror-stricken around me; or, not seldom, I would write it down upon slips of paper, which I afterwards took care to tear up small, or put them into the fire, or devoured them.

Once, however, when engaged in this practice, a high wind, coming in at the open window, scattered these interesting disclosures in every direction, and drove me as nearly mad as a sane man could go. There were as many as twenty distinct revelations of the most mysterious fact in the world's history thus set flying over space, so that any one might run and read them. Nineteen of these I recovered by means of almost superhuman exertions. Two were reclaimed, at peril of life and limb, from a neighbour's wall with *choux-de-fries* at the top of it; three of them had lodged in a very lofty tapering tree, which practically demonstrated the dreaded fact of my Sybilline leaves becoming poplar; five were carried into the river, and had to be rescued by boat; seven had been whirled into the kennel of a proverbially savage dog, which, however, was so impressed by my eager haste and furious vehemence, that he vacated his quarters at the first summons, and fled, howling, to the utmost extent of his chain. One was brought down from a chimney-pot by a very small sweep, who, luckily for me and for himself, proved to my satisfaction that he had never been taught to read; one I found the kitten at play with in the garden, which presently I put to death accordingly, without open trial, after the manner of the tribunals of Westphalia; the twentieth could nowhere be found. There was lying somewhere, patent to the first passer-by, an explicit solution of the whole art of freemasonry in my own peculiar and well-known handwriting. This thought, which was of a nature to make the most stolid anxious, excited me to frenzy. I went about demanding of my fellow-creatures whether they had seen a small piece of paper in the air lately.

'What paper? What was on it?' inquired they.

What was on it, indeed? A question not to be answered very readily. I did not go to bed for eight-and-forty hours, and then I found the precious missing manuscript neatly deposited between my neckerchief and my false collar; after which I abstained from writing out the secret any more. I carried it about with me on my mind, nevertheless, and a very dreadful burden it was. Waking or sleeping, but especially sleeping, I was always picturing to myself the consequences of revealing what I knew, and thereby endured the imaginary pains of half-a-dozen opium-eaters. Methought that the Provincial Grand of our lodge, who, in private life, is a most respectable grocer, was the individual selected by the society as the avenger of violated faith. He was wont to pursue me in his full official costume, which, however, seemed to attract no greater attention in the streets of the city than in the deserts (all bearing an absurd likeness to the back-garden of my private residence), whither I sometimes, in vain, betook myself for refuge. He

held his masonic ladder in one hand, and his trowel and pair of compasses in the other; when he had come up with me, he would describe with the compasses a magic circle, out of which I could not stir; plant his ladder against my back, as though I were a cucumber frame, and mounting upon my shoulders, trowel in hand, would mutter some cabalistic words, addressed to surrounding nature, explanatory of the reason of my being sacrificed; at which period I was wont to be awaked with the chattering of my teeth. Once, I remember throwing myself upon the protection of a policeman, who happened to be patrolling the street for the greater security of the ostrich-eggs; and he, instead of taking the Provincial Grand into custody, pointed to the collar of his own uniform, upon which, in place of a number, was emblazoned the final triangle which proclaimed the Peeler to be a Deputy Grand Arch himself. My state of mind became at length so unsupportable, that I was obliged to take a friend into my confidence. I did not, of course, confide to him the secret, but I told him of the anxiety which was continually consuming me regarding it.

'Well,' said Jones, after having listened patiently to the sad recital—he was a very well-meaning young man, only rather volatile—'I have a plan which, I think, will benefit you: for your sake—although I know the whole thing is nonsense—I am ready to become a freemason myself; then, you see, you will have a confidant—a being in whom you may repose your trouble. We will retire together for an hour or so every day into some lonely spot—down the well, or up the chimney, or into the House of Lords while they are despatching business—and there we will converse about this secret, if there be a secret, and relieve your mind.'

This project transported me with joy and gratitude. I made the necessary arrangements with the officials in our lodge for Jones's admission, without, of course, mentioning my particular reason for getting it done, and he came down to my house from London upon the evening preceding his installation. I had been useful to Jones more than once in the way of lending him a little money when he was hard up, and I was therefore not surprised when, as we were sitting together after dinner over our wine, he requested of me the temporary loan of a ten-pound note.

However, as there was a small account already between us, I moved as an amendment that the sum should be decreased by one half, to which, after a slight discussion, my friend acceded, and retired to rest apparently satisfied, with a five-pound note of mine in his purse.

We lay in a double-bedded room, for the convenience of conversing upon my all-engrossing topic, and we fell asleep while talking of it. I was awaked in the morning by the entrance into the room of my companion, ready dressed, and with his hat on, as though he had been out for an early stroll.

'Why, I never heard you get up,' said I; 'I must have slept very soundly.'

'You did,' replied Jones in a solemn and measured tone: 'very, very soundly; and you dreamed, I think?'

'I believe you, my boy,' cried I, chuckling with the thought of how soon such things would be all over. 'I just did dream.'

'You dreamed of the—the secret, did you not?' continued he.

'Of course I did,' said I; 'I always do dream of the secret.'

'Indeed,' observed Jones, with an unpleasantness in his manner; 'and do you also always talk of your sleep?'

I felt exactly as if a jug of ice-cold water had been poured down the nape of my neck.

We were both silent for at least a minute, and then Jones quietly remarked: 'I think you might just as well make that five pound a tenner, do you know!'

'Make it twenty,' exclaimed I, with eagerness: 'oblige me by accepting a twenty-pound note.'

'Thank you,' replied Jones coolly; 'I think I will. From what you said last night,' added he with a grim smile, 'I understood that you had not so much money in the house.'

Then I remembered having made use of that little tarriddle, or delicate evasion, in order to get rid of his importunity upon the previous evening. By his reminding me of it thus boldly, it was evident that I must have put myself into his power indeed.

'Do you know all?' inquired I hoarsely.

'Well,' said he carelessly, 'there is no need for my being masonified; I know all about the'—— He enunciated the awful secret, the mystery of the ages, the hidden wonder, as though he were retailing some political tittle-tattle of the clubs. 'You see,' he continued, 'you awoke me, and kept me awake by repeating it so very distinctly over and over again, that I have got it quite pat. I could not forget it even if I would. Since you seemed to be in such admirable case for it, I could not help trying that experiment—with which you are doubtless acquainted—of interrogating a sleeping person regarding the subject of his dreams, and your answers were astonishingly clear and pertinent. I never was spectator of anything more interesting and curious. It is positively a contribution to psychological science. I think, indeed, that I shall publish an ac'——

At that instant, I made my long contemplated spring out of the bedclothes, and placed myself between my enemy and the door. In my hand was the life-preserver with which my pillow is always furnished, and in my eyes was the determination to use it as a life-preserver. 'Jones,' I observed, 'as I must save my own life—you must die.'

'You mean to kill me, then, do you?' said he jauntily.

'My friend,' replied I, waving the weapon to and fro to give solemnity to my manner, 'I have unfortunately no choice; you have wantonly opened the Bluebeard's chamber of my mind, and now you must pay the penalty. I regret the sad necessity, believe me, almost as much as you can yourself, but the thing must be done. I shall hit you between the eyes as nearly as I can, so that the whole matter will be but the work of an instant, and the pain scarcely appreciable. However, in the meantime, if you have any message or document to leave behind you, intrust it to me, and be sure of its delivery.'

'Yes,' said Jones decisively, 'there are two documents down stairs in the possession of my servant, with whom I have but just left them. The one is to be delivered to your friend the Provincial Grand at once if anything should happen to me, and the other to the mayor of this town. The law will therefore hang you upon strong circumstantial evidence, unless the brotherhood put you to death beforehand by some more terrible method. You have not given me that twenty-pound note, by the by, old fellow. Where is it?'

'Here,' said I, tottering to my trousers, and taking out my pocket-book with a trembling hand: 'here's a fifty-pound note, which you may keep as a small token of my affectionate regard. I love you, Jones; you know I was only in fun all along.'

'Thank ye,' said my volatile friend, as he pocketed the money; 'so was I too. I have been playing a trick upon you from the very beginning.'

And then—with his nose, and knees, and

elbows, according to the orthodox manner, so often practised by me in secret—he made, to my astonishment, the freemason's sign.

'You must know, my dear fellow,' added he, 'that I have been a mason myself these ten years; and as for your revelations during sleep, they consisted of nothing beyond snoring.'

AN ASSORTMENT OF SURNAMES.

FAMILY nomenclature is a subject of considerable interest beyond the sphere of the etymologist and antiquary, of whose learned labours, however, we wish to speak with the greatest respect. Whence existing surnames have been derived, and the changes they have undergone, are points in the illustration of which much pains and patience have been expended. To use a comparison well understood in these days of mechanics and engineering, a broad highway has been carried through the midst of this special question; but we prefer just now turning aside into a bypath opened up by the registrar-general of England in his last annual Report. That communicative functionary devotes a whole chapter to this topic; and as probably not one in a thousand of our countrymen will ever see the original, we propose to present, in a simplified and reclassified form, the curiosities of fact which he has placed at our disposal. We are first of all informed that in the department over which he presides, there is a registration of more than 21,000,000 names, all collected between the 1st of July 1837 and the end of 1854. From the registration indexes thus possessed, the surnames at present borne in England and Wales could be pretty accurately ascertained; but the trouble involved in such an inquiry is sufficient to appal the Samson of statistics himself, who has limited his researches to two quarterly indexes—one of births, and another of deaths—resulting in the discovery, that of 275,405 individuals registered, 82,818 had different surnames—showing an average of 8·4 persons to every surname. It is then 'assumed as a rough estimate, that the whole number of surnames in England and Wales is between 35,000 and 50,000,' orthographical differences (as Clerk, Clark, Clerke) being allowed to pass for a difference of name. The roots of surnames now in use would be found to fall considerably short of the above number. Wales and Cornwall differ from England in the constantly recurring sameness of the nomenclature; in the former, nine-tenths of the people, it is said, could perhaps 'be mustered under less than 100 different surnames;' so that 'the primary object of a name, which is to distinguish an individual from the mass,' is in danger of being lost.

By the aid of a table compiled from 'nine quarterly indexes of births, eight of deaths, and eight of marriages,' we are enabled to see what the fifty most common surnames are, and the number of times each surname occurs. The Smiths, of course, are at the head of the poll, their name boasting 83,557 entries; but their supremacy is imperiled by the tribe of Joneses, who stand 83,841 strong. That of Williams numbers 21,986. Below 20,000 are arrayed the clans Taylor, Davies, Brown, Thomas, Evans, Roberts, and Johnson. The others have fewer than 10,000 followers, the lowest figure falling to Griffiths—4639. These fifty names embrace nearly eighteen in every 100 of those registered—about one in six; and as the total

entries of the fifty are 440,911, the nine indexes may be considered to contain about 2,500,000 entries—certainly a fair number from which to judge.

A second table deals with the same fifty surnames with reference to their origin, and furnishes the number of entries in the following order—

	Names.	Entries.
Derived from Christian or fore-names,	27	246,032
" occupations,	13	120,691
" locality,	7	46,373
" personal peculiarities } (White and Brown), }	2	22,154
" other circumstances (King),	1	5,661
Total,	50	440,911

Returning to the statistical case of *Smith versus Jones*, the registrar-general informs us that the whole of the indexes from 1838 to 1854 were searched 'to determine the relative frequency' of these competing surnames; and the numerical issue is in favour of the Smiths. Of Smiths, the entries were 286,037; of Joneses, 282,900—a *Smith* majority of 3137. In seven years, the Joneses were more numerous; in eleven years (including the last seven), the Smiths; and so, as there is no reason against our siding with the winning party, we cry—Hurrah for the Smiths! Both tribes, however, are entitled to all the deference which numbers can give them, since it is calculated that in England and Wales they include together not less than half a million persons—sufficient of themselves to people four towns as large as Birmingham, Bristol, Leeds, and Hull. With respect to 'the fifty most common surnames,' we are favoured with a further computation, which makes it appear that in 1853 England and Wales contained 3,253,800 persons bearing these family names; or, in other words, that about two in every eleven Englishmen and Welshmen are known among men by one or other of these fifty surnames.

More of these statistical curiosities are behind. Descending to the letters of the alphabet, we learn that 'the letter B is the most frequent initial of surnames,' being about 10 per cent. of the whole. H is above, and S and W nearly 9 per cent. N and K are lowest in the scale of proportion, excepting X and Z.

Here we might conclude our ramble, but we are tempted to prolong it on account of the singular scene which the indefatigable general of registrars lays before us. This is no other than a list of more than 2000 *peculiar surnames* selected from the birth-indexes of the first quarter of 1851, and the death-indexes of the corresponding quarter of 1853. Very peculiar, in truth, many of these surnames are, and certain of affording a delightful feast to the lovers of the droll and the grotesque. In the book before us, they are placed in alphabetical order; but the amusement they offer is best secured by such an arrangement of them as will shew the treasures of descriptive phraseology they comprise. The *classical deities* live again in Bacchus, Mars, and Venus—a well-matched trio; in Flora, Fortuna, Muse, and the Muses; the Phoenix and the Griffin recall the fables of the East; while Mabb and Fay speak to us of myths that still linger in the villages of our land. *Classical history* is remembered in Damon and Dion; Hector and Troy are not yet extinct; neither is Rome nor the Roman name; and though Hannibal reappears, the honours of the Latin name are worthily committed to Cato, Scipio, and Cæsar, who may trace in Dominey a fragment of the language in which they harangued and wrote. *Modern nationalities* are pointed out by French and Gaul, Saxon, Dutch, and Dane. The Spaniard must be content with his Don, but the Turk comes in for a name. North and South Africa are arbitrarily represented by Barbary and the Caffre; and the sound of

Cashmere immediately connects in our thoughts the looms of that famous valley-kingdom with the spindles of our own. *Sacred Scripture*, as might be supposed, has suggested several names, although the selection is peculiar enough. Angel and Demon stand in contrast. Eve makes her entry, and, under her protection, her scapegrace first-born Cain. Noah—the hale old man, 'orphan of the old world, and father of the new'—is here; but whence comes Balaam, and stranger still, Dives and Pharrisæe? As much out of place in another direction are Calvary and Pentecost. Heaven and Heavens, Saint and Sanctuary, Priest and Prophet, with Christian itself, have clearly a Biblical origin; but to a later source we must refer Pagan, with Lent and Christmas. Church, with its compound Churchward, and less agreeable companion Churchyard, belong to a similar period; as do Abbot (not mentioned in this list) and Prior. There can be no doubt where Surplice, Spires, and Steeple come from.

The need of the *law* is vindicated by Lawless, Felony, and Felons—its character by Just and Justice—its operations by Sessions and Jury—its pleasures by Fee—and one of its results by Fines.

The science of *medicine* is celebrated under the homely name of Physick. The Potecary and his Pill are not far apart. A Hospital, indeed, leaves the mind free to roam over Collick, Cramp, Fever, and the painful plural Fevers; but more cheerful thoughts of Balm and Balsam are not absent; while Heal and Cure shed a cheerful hue over the sable scene.

Military operations for two years have commanded a large share of public attention; but previous to these, and although we are not a soldier-nation, the list of surnames testifies to the belligerent tendency of our population. The Warrior and Cavalier issue from their Castle; they have their Arms offensive and defensive. Armour of Mail is provided, with the Shield. Honour is done to the Dart and the Arrow, England's once formidable and favourite weapon. The Dagger and Dirk are in request, with the Lance and the Sword. Thus equipped, the Gauntlett is ready; but besides all, we have the Gunner with his Gun; even Cannon of the largest calibre. Then waves the Banner, and then beats the Drum, while Slaughter leads the way to Victory and Conquest.

Naval matters are not overlooked. The Ship multiplies into Shipping, and it swells into a Fleet. The single vessel has its Keel and Deck, its Helm, its Middlemast, and its Tackle; and for the boat there must be the Oar. When launched, it can Float, and with a Chart may set out upon its Cruise, in the course of which it will often have to Tack before the Gale. Should a Tempest cause a Leak, the sailors will look with anxiety for a Harbor or Haven on the Mainland; and sailing this, even the most skilful Diver will be liable to Drown.

Now, turning from the learned professions, and the contingencies of land and sea, let us examine Man as a member of the great creation; and not small is the help which our English surnames will impart to that compound being in his endeavour to obey the oracle, and know himself. First, they will inform him that he has a Bodily structure, a Body, and, not less really, an indwelling Soul. The former has vital organs, such as the Head—in old English a Pate, and in low English a Noddle. Within the head is a Brain or Brains, else it will be of little use to its owner. On the top is Hair, consisting of many Hairs, which on the female head fall down in many a Curl. In front is the Fore-head—beneath it, the Eyes; and beneath them, the Cheek. Tongue and Tooth appertain to the mouth, and so the face tapers down to the Chin. Why the nose is omitted in this inventory of the features is a mystery; so prominent a member must have a keen sense of the insult, and may be expected to set itself

to scent out the cause. Alone, the head would be in a sad predicament, and owes much to the Neck in joining it to the rest of the body. The Collarbone is not to be despised, though not to compare with the Heart, the Liver, and the Bowel departments of the system. More than one Limb is demanded for the symmetry of the body; and these are forthcoming in the Arms, with the Hand and Hands—and the Leg, with its Knee and Kneebone—and last of all, the Foot, with its great Toe and the lesser Toes.

Arising out of his physical nature, man has the power of movement. He can Tarry or Travel—his motion may be Slow or Swift; but without question it will be Quick if he has to take to Flight! As a *pedestrian*, we speak of his Gait, which may be Stiff or Easy, Awkward or full of Grace. He may Saunter or Skip, he may Waddle or Dance. Should he Jump and Slide, he may chance to Trip. Should he Go lightly, he is the better able to Flit from place to place. If he acts the *equestrian*, he will regulate the pace at which to Ride. His horse may be an Ambler, or he can make it Canter and Trot, or put it to the Gallop. If it should Prance or Kick, it may Fling him from his saddle, and for that day at least his exercise would be likely to Cease.

As man is endowed with *vocal organs*, we are not surprised that while he can be Silent, he may also make a Noise; animal-like he may Bray, or Howl, or Screech; or, using the faculty of speech, he can Chatter so volubly as to pass for a Chatterbox. In private, he may Grumble, or, worse still, become a Tattler. In public, he may be little better than a Bawler; yet should he Stammer, he will be less likely to indulge in Twaddle. When able to Sing and to Chant, he is provided with the means of gratification, exhilarating and innocuous.

Differences of *physical appearance* are often very striking. Some are Tall and Large, others Short and Small. Of some we speak as Thick, Fatt, or Stout; of others as Slight, Slender, or even Gaunt. To be Bandy is seldom the result of anything but neglectful nursing.

But human nature is the subject of deep emotions, and these, both the brighter and the darker, are of innumerable shades. Pain becomes Anguish; Care deepens into Fear—this into Dread. Sudden Fright is rarely so injurious as settled Grief. The Anger which smokes may flame into Wrath and burst into Fury. On the contrary, there is an Affection that must Gladden every observer. A Happy state of mind may rise into Joy, and this feeling culminates in Bliss. All emotions when intense cause the nervous system to Tremble with the excitement they produce.

As a *moral being*, man is capable of Virtue and Vice; Courage and Zeal may be displayed for any purpose; but Faith or Verity, with Peace, Patience, Prudence, Hope, and Love, are most frequently associated with that which is noblest in human life. Overagainst these, however, is Evil in the form of Folly, Vice, and Crime. Rant, Cant, and Fudge are at all times vexatious; but the Amour that depraves, the Gambling that inflames, and the Spite that turns the milk of human kindness into gall, leave a heavier Blot, and diffuse a deadlier Blight. Philosophers divide all moral qualities into Good or Base; and there is no sane mind which is Blank in this respect. It is possible to meet with some Badman, who is so Vile as to be a moral Blackamore—as here and there some may seem Allgood, and Perfect, or Faultless. Few would be disposed to apologise for the Wanton, the Prigg or Tricker, the Rake, the Scamp in general, the Swindler in particular, or the Tippler, who may be all in one. These, if Found or Caught, would be in some Danger of tasting the rigours of the law; but perhaps as much moral evil and discontent are occasioned by other parties deemed less culpable—as by the Vain,

the Sly, the Proud, the Greedy, and the Idle. It is not considered much Amiss to be Lax, Careless, or Cross; but the consequences are deplorable enough. Many a Bonfellow and Meanwell has made a sorry figure in the world. To be Innocent as infancy is not our lot; but to be Meek and Gentle to all, Humble in spirit, Constant and Faithful to our promises, Kind even to our enemies—this is possible; and in proportion as we Excel in these qualities shall we be deemed Trusty and Worthy; and he who is Good to man and Godly towards his Maker, has no cause for fear. In disposition, what varieties do the walks of life exhibit! The Coldman is apt to make his neighbour the Chillman, till the Merryman appears. It is natural to some to be Bold, Valliant, Gallant, and Doughty; another is predisposed to act the Coward. The man of Brag talks as a Bouncer, but seldom develops into the Boxer. One is Trim and Stiff; a third is Easy. The Coy and Dainty may be set against the Jolly and the Eager; while it is possible for the Lively man to have so much of the Fussey about him as to be far from Pleasant in society—even a Pester and a Bore.

Intellectually considered, we perceive one man to be Ready with an Argument, and able Cleverly to conduct it, while another has but a Faint or Crude conception of what it means. The Brightman, the Wise, and the Witty, to whom we must add the men of Fancy and the Bard, are the companions we seek, being as anxious to shun the society of the Muff, the Dolt, the Daft, as of him whose former acuteness has been Dulled by long excess.

The genus *homo* has its *genders and relationships*, and these are pretty fully expressed by the following terms—Male, Baby, Suckling, Child, Bratt, Boy, Daughters. Marriage and Wedlock involves a Partner of each sex. Man is the Husband or Younghusband, as the case may be: the Dame may be a Virgin—classically Virgo—vulgarily Wench, or taken from the interesting class of Widows. Cousin and Uncle, and many another Kinsman, form the Kindred which Fathers of families may be prepared to treat with relative amenity and good-will.

Eating and drinking constitute so important a portion of human occupation, that a liberal inventory of articles of fare may be expected in the surnames of the land. Meats of the Flesh description are plentiful—Gammon of Bacon, Ham, Veal, Mutton, and Giblett; with liberty to Frizzle, Fry, or Stew them. Every variety of Fish and Fowl is also present—from Turtle down to Trout, and from Chicken up to Goose. Eggs are at hand, with Mustard, Pepper, and Pickles as condiments. Cabbage and Butter are not lacking, with Pease and many a Spice besides. Rice as a pudding is on the board. As a dessert, every kind of fruit is in waiting—the Date, Figg, Cherry, Almond, Nut, Orange, Peach, Plum, Raisin, Grapes, &c. For tea, there are Cake, Cakebreed, Muffin, Bunn, Honey, and Sugars of every name. Of drinks there is no stint. The temperance man has his Wells and Streams, with the addition of Congo and other sorts of Tea, also Coffee and Milk; and the lover of intoxicating liquor is placed in hazardous proximity to his Gin or Punch, his Wines, yclept Port, Sherry, and Claret, and his Malt compounds of Beer and Porter. Tart, Sweet, and Mellow are borrowed from man's sense of taste, as Round and Square to his sense of touch.

Wearing apparel and domestic articles, from a Bodkin to a Broom, are represented by a long array of names. His sight is regaled with a diversity of colours—exclusive of the ordinary Browns, Blacks, and Greens—such as the various Blues of sky and water—Gray, Purple, Red, Yellow, and White the nondescript. But man is also a *numbering animal*—a capacity which in its highest developments separates him from the brute; hence we proceed from the Unit to Two, Twin, Double, Treble,

Triplett, up to Twelves, Eighteen, Forty, and a Million. Scarce, Few, Much, and Muchmore are indefinite terms in common use. Man, too, is a *dealer in money*—a propensity which is here indicated by the foreign Ducat, the obsolete Mite, the Farthing, Halfpenny, Penny, Twopenny, and Pound.

He distinguishes *times and seasons*—as Day and Night, and can even imagine a Doubleday. Half-night is familiar to him. Dark gives place to Dawn, and so on to Noon and Vesper, till the Daily course is run. The succession of time is marked by Early, Late, Later, Last. Monday and Friday are recorded, and Middleweek instead of Wednesday. Weeks appear, as also January and May, among the months. Mid-winter and Winter, Northeast and West, are remembered, besides every other point of the compass. Man can *measure* things to an Ace; and other surnames remind us of the Inch, Halfyard, Yard, Ell, Furlong, and Halfacre. The retail trader has his Peck and Bushel; the apothecary, his Grain; the liquor merchant, his Gallon, Firkin, and Butt.

Of *minerals* there is a Treasure—the native Copper and artificial Brass, followed by Silver, Gold, Pearl, Ruby, and Diamond.

Our form of government is a limited monarchy, and the English have a high respect for *Rank*. The Court is in public favour, for though we have no Rex, we have a Monarch who nobly wears the Crown, and is allied to a Prince who does honour to his Royal station.

In contrast with the preceding are a batch of names that call up anything but cheerful images. The Dead-man is the notion of Death (also Mort), and the funeral Knell tells his Coffin to the Grave. Murthor calls us to meditate on the Graves that single crime has dug.

A long list of surnames descriptive of tame and wild beasts, birds and insects, fishes and fowls, trees and flowers, must be omitted, or reserved for another occasion. In bringing up the rear of these remarks, Catchaside, Godbelieve, Gotobed, Maybee, Sneezum, will serve as a few examples of the oddities sprinkled over this list of 2000 words.

Nothing can now be said of the ridiculous combinations of Christian and surnames frequently to be met with. To call a child, for instance, whom we knew, 'Napoleon Chick,' was just pinning to the poor boy a life-long joke. The family name cannot easily be changed, but parents may avoid, by a little exercise of judgment, increasing the laughable and absurd associations which are already too freely mixed up with the nomenclature of our native realm.

OCEOLA:

A ROMANCE.

CHAPTER LXXXIX.—AN ENEMY UNLOOKED FOR.

As upon the stage of a theatre, the farce follows the grand melodrama, this tragic scene was succeeded by an incident supremely ludicrous. It elicited roars of laughter from the men, that, under the circumstances, sounded like the laughter of madmen. Maniacs, indeed, might these men have been deemed, thus giving way to mirth with a prospect before them so grim and gloomy—the prospect of almost certain death, either at the hands of our savage assailants, or from starvation.

Of the Indians, we had no present fear. The flames that had driven us out of the timber, had equally forced them from their position, and we knew they were now far from us. They could not be near. The burnt branches had fallen from the pines, and the foliage was entirely consumed, so that the eye

was enabled to penetrate the forest to a great distance. On every side we commanded a *vista* of at least a thousand yards, through the intervals between the red glowing trunks; and beyond this we could hear by the 'swish' of the flames, and the continual crackling of the boughs, that fresh trees were being embraced within the circle of conflagration, still extending its circumference outward.

The sounds grew fainter apace, until they bore a close resemblance to the mutterings of distant thunder. We might have fancied that the fire was dying out; but the luminous ring around the horizon proved that the flames were still ascending. It was only because the sounds came from a greater distance, that we heard them less distinctly. Our human foes must have been still further away. They must have retired before the widening rim of the conflagration. Of course they had calculated upon doing so, before applying the torch. In all likelihood, they had retreated to the savanna to await the result.

Their object in firing the forest was not so easily understood. Perhaps they expected that the vast volume of flame would close over and consume us; or, more likely, that we should be smothered under the dense clouds of smoke. This in reality might have been our fate, but for the proximity of the pond. My companions told me that their sufferings from the smoke had been dreadful in the extreme—that they should have been stifled by it, had they not thrown themselves into the pond, and kept their faces close to the surface of the water, which of itself was several feet below the level of the ground.

It had been to me an hour of unconsciousness. My faithful black had carried me—lifeless as he supposed—to the water, and placed me in a recumbent position among the reeds.

It was afterwards—when the smoke had partially cleared away—that the spies were put upon their trial. Hickman and Weatherford, deeply indignant at the conduct of these monsters, would not hear of delay, but insisted upon immediate punishment; so the wretches were seized upon, and dragged out of the pond, to undergo the formality of an examination. It was at this crisis that my senses returned to me.

As soon as the dread sentence had been carried into execution, the *ci-devant* jurors came rushing back into the pond, and plunged their bodies under the water. The heat was still intense and painful to be endured.

There were two only who appeared to disregard it, and who shewed their disregard by remaining upon the bank; these were the two hunters.

Knives in hand, I saw them stooping over a dark object that lay near. It was the horse that Hickman had shot in the morning. I now understood the old hunter's motive, which had hitherto mystified me. It was an act of that cunning foresight that characterized the man—apparently instinctive.

They proceeded to skin the horse; and in a few seconds, had peeled off a portion of the hide—sufficient for their purpose. They then cut out several large pieces of the flesh, and laid them aside. This done, Weatherford stepped off to the edge of the burning timber, and presently returned with an armful of half-consumed fagots. These were erected into a fire near the edge of the pond; and the two men squatting down by its side, commenced broiling the pieces of horseflesh upon sapling spits, and conversing as coolly and cheerily as if seated in the chimney-corner of their own cabins.

There were others as hungry as they, who, taking the hint, proceeded to imitate their example. The pangs of hunger overcame the dread of the heat.

atmosphere; and in a few minutes' time, a dozen men might have been observed grouped like vultures around the dead horse, hacking and hewing at the carcass.

At this crisis occurred the incident which I have characterised as ludicrous. With the exception of the few engaged in their coarse *cuisine*, the rest of us had remained in the water. We were lying round the circular rim of the basin, our bodies parallel to one another, and our heads upon the bank. We were not dreaming of being disturbed by an intruder of any kind—at least for a time. We were no longer in dread of the fire, and our savage foemen were far off.

All at once, however, an enemy was discovered in an unexpected quarter—right in the midst of us. Just in the centre of the pond, where the water was deepest, a monstrous form rose suddenly to the surface—at the same time our ears were greeted with a loud bellowing, as if half a score of bulls had been set loose into the glade. In an instant the water was agitated—lashed into foam—while the spray was scattered in showers around our heads.

Weird-like and sudden as was the apparition, there was nothing mysterious about it. The hideous form, and deep bovine tone, were well known to all. It was simply an alligator.

But for its enormous size, the presence of the creature would scarcely have been regarded; but it was one of the largest of its kind—its body in length almost equalling the diameter of the pond, with huge gaunt jaws that seemed capable of swallowing one of us at a single 'gulp.' Its roar, too, was enough to inspire even the boldest with terror.

It produced this effect; and the wild frightened looks of those in the water—their confused plunging and plashing, as they scrambled to their feet, and hastened to get out of it—their simultaneous rushing up the bank, and scattering off over the open ground—all contributed to form a spectacle ludicrous as exciting.

In less than ten seconds' time, the great saurian had the pond to himself, where he continued to bellow, and brandish his tail as if triumphant at our retreat.

He was not permitted to exult long in his triumph. The hunters, with several others, seized their rifles, and ran forward to the edge of the pond, when a volley from a dozen guns terminated the monster's existence.

Those who had been 'ashore' were already convulsed with laughter at the scared fugitives; but the latter, having recovered from their momentary affright, now joined in the laugh till the woods rang with a chorus of wild cachinnations. Could the Indians have heard us at that moment, they must have fancied us mad—or more likely dead, and that our voices were those of their own friends, headed by Wykomé himself, rejoicing over the infernal holocaust.

CHAPTER XC.

A CONFLICT IN DARKNESS.

The forest continued to burn throughout the night, the following day, and the night after. Even on the second day, most of the trees were still on fire. They no longer blazed, for the air was perfectly still, and there was no wind to fan the fire into flame. It was seen in red patches upon the trunks, smouldering and gradually becoming less, as its strength spontaneously died out. From many of the trees the fire had disappeared altogether, and these no longer bore any resemblance to trees, but looked like huge, sharp-pointed stakes, charred, and black, as though profusely coated with coal-tar.

have been traversed, there were other places where the fire still burned—enough to oppose our progress. We were still besieged by the igneous element—as completely confined within the circumscribed boundaries of the glade, as if encompassed by a hostile army of twenty times our number. No rescue could possibly reach us. Even our enemies, so far as our safety was concerned, could not have 'raised the siege.'

The old hunter's providence had stood us in good stead. But for the horse, some of us must have succumbed to hunger; or, at all events, suffered to an extreme degree. We had now been four days without food, except what the handful of pine-cones and the horseflesh afforded; and still the fiery forest hemmed us in. There was no alternative but to stay where we were, until, as Hickman phrased it, 'the woods shed git cool.'

We were cheered with the hope that another day would effect this end, and we might travel with safety amid the calcined trunks, and over the black smouldering ashes.

But the prospect before us was even as gloomy as that around us. While our dread of the fire declined, that of our human foes increased in an inverse proportion.

We had but little hope of getting off without an encounter. They could traverse the woods as soon as we, and were certain to be on the look-out. With them the account was still to be settled—the gauntlet yet to be run.

But we had grown fiercer and more fearless. The greatest coward of our party had become brave, and no one voted either for skulking or hanging back. Stand or fall, we had resolved upon keeping together, and cutting our way through the hostile lines, or dying in the attempt. It was but the old programme, with a slight change in the *mise en scène*.

We waited only for another night to carry the plan into execution. The woods would scarcely be as 'cool' as we might have desired, but hunger was again hurrying us. The horse—a small one—had disappeared. Fifty starved stomachs are hard to satisfy. The bones lay around, clean picked—those that contained marrow, broken into fragments, and emptied of their contents. Even the hideous saurian was a skeleton!

A more disgusting spectacle was presented by the bodies of the two criminals. The heat had swollen them to enormous proportions, and decomposition had already commenced. The air was loaded with that horrid effluvia peculiar to the dead body of a human being.

Our comrades who fell in the fight had been interred; and there had been some talk of performing the like office for the others. No one objected, but none volunteered to take the trouble. In such cases, men are overpowered by an extreme apathy; and this was chiefly the reason why the bodies of the two spies were left uninterred.

With eyes bent anxiously towards the west, we awaited the going down of the sun. So long as his bright orb was above the horizon, we could only guess at the condition of the fire. The darkness would enable us to distinguish that part of the forest that was still burning, and point out the direction we should take. The fire itself would guide us to shunning it.

Twilight found us on the tiptoe of expectation, and not without hope. There was but little noise among the scathed pines; the smoke appeared slighter than we had yet observed it. All believed that the fires were nearly out, and that the time had arrived when we could pass through them.

An unexpected circumstance put this point beyond conjecture. While we stood waiting, the rain began

minutes it came pouring down as if all heaven's fountains had been opened together.

We hailed the phenomenon with joy; it appeared an omen in our favour. The men could hardly be restrained from setting forth at once; but the more cautious counselled the rest to patience, and we stood awaiting the deeper darkness.

The rain continued to pour, its clouds hastening the night. As it darkened, scarcely a spark appeared among the trees.

'It is dark enough,' urged the impatient. The others assented; and all started forth into the black bosom of the ruined forest.

We moved silently along, each tightly grasping his gun, and holding it ready for use. Mine was carried in one hand—the other rested in a sling.

In this plight I was not alone; half-a-dozen of my comrades had been also 'winged;' and together we kept in the rear. The better men marched in front, Hickman and Weatherford acting as guides.

The rain beat down upon us: there was no longer a foliage to intercept it. As we walked under the burnt branches, the black char was driven against our faces, and as quickly washed off again. Most of the men were bareheaded; their caps were over the locks of their guns to keep them dry; some sheltered their priming with the skirts of their coats.

In this manner we had advanced nearly half a mile—we knew not in what direction; no guide could have found a path through such a forest. We only endeavoured to keep straight on, with the view of getting *beyond* our enemies.

So long unmolested, we had begun to hope.

Alas, it was a momentary gleam! we were under-rating the craft of our red foemen.

They had been watching us all the time—had dogged our steps, and, at some distance off, were marching on both sides of us in two parallel lines. While dreaming of safety, we were actually in their midst.

The flashes of a hundred guns through the misty rain—the whistling of as many bullets—was the first intimation we had of their proximity.

Several fell under the volley—some returned the fire—a few thought only of flight.

Uttering their shrill cries, the savages closed in upon us; in the darkness, they appeared to outnumber the trees.

Save the occasional report of a pistol, no other shots were heard or fired—no one thought of reloading. The foe was upon us before there was time to draw a ramrod. The knife and hatchet were to be the arbiters of the fight.

The struggle was sanguinary as it was short; many of our brave fellows met their death, but each killed his foeman—some two or three—before falling.

We were soon vanquished. How could it be otherwise? the enemy was five to one. They were fresh and strong—we weak with hunger—almost emaciated—many of us wounded: how could it be otherwise?

I saw but little of the conflict—perhaps no one saw more; it was a struggle amidst obscurity—darkness almost opaque.

With only one hand—and that the left—I was quite helpless. I fired my rifle at random, and had contrived to draw a pistol; but the blow of a tomahawk hindered me from using it, at the same time striking me senseless to the earth.

I was only stunned; and when my senses returned to me, I perceived that the conflict was over.

Dark as it was, I could see a number of black objects lying near me upon the ground; they were the bodies of the slain.

Some were my late comrades—others their foes—in many instances locked in each other's embrace. Red Indians were stooping over, as if separating them.

On the former they were executing their hideous rite of vengeance—they were scalping them.

A group was nearer—the individuals who composed it were standing erect. One in their midst appeared to issue commands; even in the gray light I could distinguish *three waving plumes*. Again *Oceola*!

I was not free, or at that moment I should have rushed forward and grappled him—vain though the effort might have been. But I was not free. Two savages knelt over me, as if guarding me against escape.

I perceived the black near at hand, still alive, and similarly cared for. Why had they not killed us?

A man approached the spot where we lay. It was not he with the ostrich plumes, though the latter appeared to have sent him. As he drew near, I perceived that he carried a pistol: my hour was come.

The man stooped over me, and placed the weapon close to my ear. To my astonishment, he fired it into the air!

I thought he had missed me, and would try again. But this was not his purpose; he only wanted a *light*.

While the powder was ablaze, I caught a glance of the countenance. It was an Indian's. I thought I had seen it before; and from some expression the man made use of, he appeared to know me.

He passed rapidly away, and proceeded to the spot where Jake was held captive. The pistol must have had two barrels, for I heard him fire it again, stooping in a similar manner over the prostrate form of the black.

He then rose, and called out:

'It is they—both alive.'

The information appeared meant for him of the black plumes, for the moment it was given, the latter uttered some exclamation I did not comprehend, and then walked away.

His voice produced a singular impression upon me. I fancied it *did not sound like Oceola's*.

We were kept upon the ground only for a few minutes longer, until some horses were brought up. Upon two of them Jake and I were mounted, and fast tied to the saddles. The word to advance was then given; and, with an Indian riding on each side of us, we were conducted away through the woods.

CHAPTER XCL

THE THREE BLACK PLUMES.

We journeyed throughout the whole night. The burnt woods were left behind; and, having crossed a savanna, we passed for several hours under a forest of giant oaks, palms, and magnolias. I knew this by the fragrance of the magnolia blossoms, that, after the fetid atmosphere we had been breathing, smelt sweet and refreshing.

Just as day was breaking, we arrived at an opening in the woods, where our captors halted.

The opening was of small extent—a few acres only—bounded on all sides by a thick growth of palm, magnolias, and live-oaks. Their foliage drooped to the ground, so that the glade appeared encompassed by a vast wall of green, through which no outlet was discernible.

In the gray light I perceived the outlines of an encampment. There were two or three tents with horses picketed around them, and human forms—some upright and moving about, others recumbent upon the grass, singly or in clusters, as if sleeping together for mutual warmth. A large fire was burning in the midst, and around it were men and women seated and standing.

To the edge of this camp we had been carried, but no time was left us for observation. On the instant

after halting, we were dragged roughly from our saddles, and flung prostrate upon the grass. We were next turned upon our backs, thongs were tied around our wrists and ankles, our arms and limbs were drawn out to their full extent, and we were thus staked firmly to the ground, like a pair of hides spread out to be dried.

Of course, in this attitude we could see no more of the camp, nor the trees, nor the earth itself—only the blue heavens above us.

Under any circumstances, the position would have been painful, but my wounded arm rendered it excruciating.

Our arrival had set the camp in motion. Men came out to meet us, and women crowded over us as we lay on our backs. There were Indian squaws among them, but to my surprise I noticed that most of them were of African race—mulattoes, zamboes, and negroes!

For some time they stood over, jeering and taunting us. They even proceeded to inflict torture—they spat on us, pulled out handfuls of our hair by the roots, and stuck sharp thorns into our skins—all the while yelling with a fiendish delight, and jabbering an unintelligible patois, that appeared a mixture of Spanish and Yemassee.

My fellow-captive fared as badly as myself. Homogeneity of colour elicited no sympathy from these female fiends. Black and white were alike the victims of their hellish spite.

Part of their jargon I was able to comprehend. Aided by a slight acquaintance with the Spanish tongue, I made out what was intended to be done with us.

The knowledge was far from affording consolation: We had been brought to the camp to be tortured.

We were sufficiently tortured already; but it was not all we were destined to undergo. We were to be the victims of a grand spectacle, and these infernal hags were exulting in the prospect of the sport our sufferings should afford them. For this only had we been captured, instead of being killed.

Into whose horrid hands had we fallen? Were they human beings? Were they Indians? Could they be Seminoles, whose behaviour to their captives had hitherto repelled every insinuation of torture?

A shout arose, as if in answer to my questions. The voices of all around were mingled in the cry, but the words were the same:

'Mulatto-mico! mulatto-mico! Viva, mulatto-mico!'

The trampling of many hoofs announced the arrival of a band of horsemen. They were those who had been engaged in the fight—who had conquered and made us captive. Only half-a-dozen guards had been with us on the night-march, and had reached the camp along with us. The new-comers were the main body—who had stayed upon the field of battle to complete the despoliation of their fallen foes.

I could not see them, though they were near. I heard their horses trampling around. I lay listening to that significant shout:

'Mulatto-mico! Viva, mulatto-mico!'

To me the words were full of terrible import. The phrase 'mulatto-mico' was not new to me, and I heard it with a feeling of dread. But it was scarcely possible to increase apprehensions already excited to their highest. A horrid fate was before me. The presence of the fiend himself could not have made it more certain.

My fellow-victim shared my thoughts. We were near, and could converse. On comparing our conjectures, we found that they exactly coincided.

But the point was soon settled beyond conjecture. A harsh voice sounded in our ears, issuing an abrupt order that scattered the women away. A heavy footstep was heard behind—the speaker was approaching.

In another instant his shadow fell over my face; and Yellow Jake himself stood within the circle of my vision.

Despite the pigments that disguised the natural colour of his skin—despite the beaded shirt, the sash, the embroidered leggings—despite the *three black plumes* that waved over his brow, I easily identified the man.

CHAPTER XXII.

BURIED AND BURNED.

We had both been expecting him. The cry mulatto-mico, and afterwards the voice—still remembered—had warned us of his coming.

I expected to gaze upon him with dread. Strange it may appear, but such was not the case. On the contrary, I beheld him with a feeling akin to joy—joy at the sight of those *three black plumes* that nodded above his scowling temples.

For a moment I marked not his angry frowns, nor the wicked triumph that sparkled in his eye. The ostrich feathers were alone the objects of my regard—the cynosure of my thoughts. Their presence upon the crest of the 'mulatto king' elucidated a world of mystery; foul suspicion was plucked from out my bosom: the preserver of my life, the hero of my heart's admiration, was still true—Oceola was true!

In the momentary exultation of this thought, I almost forgot the peril that surrounded me; but the voice of the mulatto once more roused me to a consciousness of my situation.

'Carajo!' cried he, in a tone of malignant triumph. *'Al fin verguenza!'*—(At last vengeance.) Both too—white and black—master and slave—my tyrant, and my rival! Ha, ha, ha!

'Me tie to tree?' continued he, after a burst of hoarse laughter; 'me burn, eh? burn 'live? Your turn come pow—trees plenty here. But no; I teach you better plan. *Carrambo, si!* far better plan. Tie to tree, captive sometime 'scape, ha, ha, ha! Sometime 'scape, eh? ha, ha, ha!'

'Before burn you, me shew you sight. Ho, there!' he shouted, motioning to some of the bystanders to come near. 'Untie hands—raise 'em up—both—face turn to camp—*basta! basta!* that do. Now, white rascal—black rascal, look—what see yonder?'

As he issued these orders, several of his creatures pulled up the stakes that had picketed down our arms, and raising us into a sitting-posture, slewed our bodies round till our faces bore full upon the camp.

It was now broad daylight—the sun shining brightly in the heavens. Under such a light, every object in the camp was distinctly visible—the tents—the horses—the motley crowd of human occupants.

We regarded not these: on two forms alone our eyes rested—the well-known forms of my sister and Viola. They were close together, as I had seen them once before—Viola seated, with head drooping; while that of Virginia rested in her lap. The hair of both was hanging in dishevelled masses, the black tresses of the maid mingling with the golden locks of her mistress. They were surrounded by guards, and appeared unconscious of our presence.

This was but for a time. One was despatched to give them notice of it.

As the information was imparted, we saw them start, and look inquiringly around. In another instant, their eyes were upon us. A thrilling scream announced that we were recognised.

Both cried out together. I heard my sister's voice pronouncing my name. I called to her in return. I saw her spring to her feet, toss her arms wildly above her head, and attempt to rush towards me. I saw the guard taking hold of her, and rudely dragging her back. Oh, it was a painful sight! Death itself would have been easier to endure.

We were allowed to look upon them no longer. Suddenly jerked upon our backs, our wrists were once more staked to the ground, and we were left in our former recumbent attitudes.

Painful as were our reflections, we were not allowed to indulge in them alone. The mulatto continued to stand over us, taunting us with spiteful words, and, worse than all, making gross allusions to my sister and Viola. Oh, it was horrible to hear! Molten lead poured into our ears could scarcely have tortured us more.

It was almost a relief when he desisted from speech, and we saw him commence making preparations for our execution. We knew that the hour was nigh—for he himself said so, as he issued the orders to his fellows. Some horrible mode of death had been promised; but what it was, we were yet in ignorance.

Not long did we remain so. Several men were seen approaching the spot, with spades and pickaxes in their hands. They were negroes—old field-hands—and knew how to use such implements.

They stopped near us, and commenced digging up the ground. O God! were we to be buried alive? This was the conjecture that first suggested itself.

If true, it was terrible enough; but it was not true.

The monster had designed for us a still more horrible death!

Silently, and with the solemn air of grave-diggers, the men worked on. The mulatto stood over directing them. He indulged in high glee, occasionally calling to us in mockery, and boasting how skilfully he should perform the office of executioner. The women and savage warriors clustered round, laughing at his sallies, or contributing their quota of grotesque wit, at which they uttered yells of demoniac laughter. We might easily have fancied ourselves in the infernal regions, in the midst of a crowd of gibbering fiends, who every moment bent over, grinning down upon us, as if they drew delight from our anguish.

We noticed that few of the men were Seminoles. Indians there were, but these were of dark complexion—nearly black. They were of the tribe of Yamassees—a race enslaved by the Seminoles, and long ingrafted into their nation. But most of those we saw were black negroes, zamboes and mulattoes—descendants of Spanish maroons, or 'runaways' from the American plantations. There were many of the latter, for I could hear English spoken among them. No doubt, there were some of my own slaves mixing with the motley crew, though none of these came near, and I could only note the faces of those who stood over me.

In about half an hour the diggers had finished their work. Our stakes were now drawn, and we were dragged forward to the spot where they had been engaged.

As soon as I was raised up, I bent my eyes upon the camp, but my sister was no longer there. Viola too was gone. They had been taken, either inside the tents, or back among the bushes. I was glad they were not there. They would be spared the pang of a horrid spectacle—though it was not likely that from such motive the monster had removed them.

Two dark holes yawned before us, deeply dug into the earth. They were not graves; or if so, it was intended our bodies should be placed vertically in them. But if their shape was peculiar, so too was the purpose for which they were made. It was soon explained.

We were conducted to the edge of the cavities, seized by the shoulders, and plunged in, each into the one that was nearest. They proved just deep enough to bring our throats on a level with the surface, as we stood erect.

The loose earth was now shovelled in, and kneaded

firmly around us. More was added, until our shoulders were covered up, and only our heads appeared above ground.

The position was ludicrous enough, and we might have laughed at it, but that we knew *we were in our graves*. The fiendish spectators regarded us with yells of laughter.

What next? Was this to be the end of their proceedings? Were we to be thus left to perish miserably and by inches? Hunger and thirst would in time terminate our existence, but oh, how many hours was our anguish to last! Whole days of misery we must endure before the spark of life should forsake us—whole days of horror and—— Ha! they have not yet done with us!

No—a death like that we had been fancying appeared too easy to the monster who directed them. The resources of his hatred were far from being exhausted—he had still other and far keener pangs in store for us.

'*Carajo!* it is good!' cried he, as he stood admiring the work done. 'Better than tie to tree—good fire, eh? No fear 'scape—*carrai*, no. *Bring fire!*'

Bring fire! It was to be fire then—the extreme instrument of torture. We heard the word—that word of fearful sound. *We were to die by fire!*

Our terror had reached its highest.

It rose no higher when we saw *pagots* brought forward, and built in a ring around our heads; it rose no higher when we saw the torch applied and the dry wood catching the flame; it rose no higher as the blaze grew red and redder, and we felt its angry glow upon our skulls, soon to be calcined like the sticks themselves.

No—we could suffer no more. Our agony had reached the acme of endurance, and we longed for death to relieve us. If another pang had been possible, we might have suffered it on hearing those cries from the opposite side of the camp. Even in that dread hour, we could recognise the voices of my sister and Viola. The unmerciful monster had brought them back to witness the execution. We saw them not; but their wild plaints proved that they were spectators of the scene.

Hotter and hotter grew the fire, and nearer licked the flames—my hair crisped and singed at the fiery contact.

Objects swam dizzily before my eyes—the trees tottered and reeled—the earth went round with a whirling motion.

My skull ached as if it would soon split open—my brain was drying up—my senses were forsaking me!

PERSONAL RECOLLECTIONS OF AUGUSTE COMTE.

As through the narrow portal, the poet approaches the Elysian fields, so in seeking to give a slight sketch of one of the greatest intellects of his generation, the writer is forced to refer to circumstances of his own insignificant existence.

In 1836, when the world was still young to me, or I to it—algebraically if not otherwise identical positions—fretting under the fancied insufficiency of private tuition in England, with hard prayers I wrung from my parents permission to continue the studies preparatory to going to the university, in Paris. Here, in each branch of the education sketched out for me with no sparing hand, I was consigned to the care of the first professors of the day. Long afterwards, I learned with what difficulty the lessons of one of these had been obtained, but youth though I then was, I still felt, indistinctly indeed, their value. This

tutor, whose last mathematical pupil I was, was Auguste Comte.

Daily as the clock struck eight on the *horloge* of the Luxembourg, while the ringing of the hammer on the bell was yet audible, the door of my room opened, and then entered a man, short, rather stout, almost what one might call sleek, freshly shaven, without vestige of whisker or moustache. He was invariably dressed in a suit of the most spotless black, as if going to a dinner-party; his white neckcloth was fresh from the laundress's hands, and his hat shining like a racer's coat. He advanced to the arm-chair prepared for him in the centre of the writing-table, laid his hat on the left-hand corner, his snuff-box was deposited on the same side, beside the quire of paper placed in readiness for his use, and dipping the pen twice into the ink-bottle, then bringing it to within an inch of his nose, to make sure that it was properly filled, he broke silence: 'We have said that the chord AB, &c.' For three-quarters of an hour he continued his demonstration, making short notes as he went on, to guide the listener in repeating the problem alone; then taking up another *cahier* which lay beside him, he went over the written repetition of the former lesson. He explained, corrected, or commented, till the clock struck nine; then, with the little finger of the right hand, brushing from his coat and waistcoat the shower of superfluous snuff which had fallen on them, he pocketed his snuff-box, and resuming his hat, he as silently as when he came in, made his exit by the door, which I rushed to open for him. This man of few words was the Aristotle or Bacon of the nineteenth century.

Thus for a year I daily sat a listener, not always attentive, and to the last but dimly conscious of the value of lessons which I can never forget in their higher meaning, though the angles and curves which they explained have long since become to me more meaningless than hieroglyphics.

One would think that such a teacher, gliding in and out like a piece of clock-work, without an interchange of any of the gentle courtesies of life, would raise only a repulsive feeling in his pupil. It was in vain I tried to break through the coldness of our relations, to establish that little preliminary gossip in which I have found some teachers too ready to employ all the time of their lesson; he seemed to say that he had nerved himself to a disagreeable duty, and that nothing should turn him from it. Only twice did I even succeed in gaining proof that he had something mortal in his composition. I had been six weeks under his tuition, and still persisted, with more, perhaps, of malice than of ignorance, in using the most abominably ungrammatical French in my written repetitions of his lectures. One morning he lost patience at some solecism more excruciating than usual; and laying down his pen, he turned to me, and said: 'Why do you persevere in writing such barbarisms?' 'You know I am a foreigner,' said I; 'how should I do better?' 'You can at least do better than this: write as you speak;' and he resumed his pen, correcting every fault of language. From that day, there were few grammatical blunders in my papers. Once again, and this time less wilfully, I encountered the same mild anger. I was at the time studying very hard, generally thirteen hours a day of book-work—a folly bitterly expiated and

repented since—and I was seldom in bed till after midnight. One black wintry morning, after harder work than usual, I nodded over the lecture. With no straining of the ears, could I drink in the sense; with no forcing of the eyelids, keep them open. I dared not rise and take a few turns in the room, for this would have been a violation of our habits. So I sat till the humming of the voice, and the scraping of the pen, acted like a lullaby, and I was already three parts asleep, when suddenly a change of tone aroused me, and the words, 'But you sleep,' recalled me to myself, only to see my tutor stalking out of the room, while I vainly tried to catch and appease him. The next day, he resumed the lesson where he had left off on the one previous to my nap, but not a word of reproach was uttered, or of apology allowed, by the insulted sage.

From that day, I began to love him. Cold or abstracted as he seemed, the intellectual giant henceforth won almost imperceptibly on the youth. I could not feel, much less measure his greatness, but I acquired an interest in the dry science he taught me; and had I continued under his charge, I might have become a mathematician. I had been taught to fear, not to revere my masters; if I had a liking for any, it had been in proportion to his laxness; and I now found myself half unconsciously, and quite unaccountably, gliding into a sort of affection for the most unapproachable, the most uncongenial of them all. I was then the most unreasonable of boy-mortals. I cannot, therefore, suppose that this feeling was due to the sway of pure reason over my mind; I can only think that it arose from an instinctive perception of the smothered kindness which entered so largely into his composition.

I returned to England to 'keep halls,' and devote myself to a new range of studies—stigmatised, I believe, by my masters and pastors as pure idleness, because not set down in their books; and it was two years before I was again in Paris. By that time I had become acquainted with what was published of the *Philosophie Positive*. From its pages I had learned that my old tutor was a great man, though hardly yet a celebrated one. I had learned to contrast his earnestness with the *laissez faire* of others; and a visit to him was one of the first pleasures which I promised myself in the capital most fertile in pleasure to youthful visitors. Mindful of the showers of snuff which had too often attacked my sternutatory muscles, I carried him a Cumnock snuff-box, with one of our Ayrshire pebbles in the lid, and was delighted to find it graciously accepted. He put it at once into a drawer of his writing-table, and then told me that he had given up the use of snuff. He said that he had withdrawn entirely from the world, to devote himself without distraction to the politics of his philosophy—that he no longer even read the newspapers, and had weaned himself from every superfluity.

It was not till 1851 that I again saw him. He was then the acknowledged chief of a school, and renowned, if not admired, among all thinkers. I had some little trouble in finding his abode, and it was with a beating heart that I pulled the bell-string. An old gentleman in a dressing-gown, with a black neckerchief strung round his throat, opened the door. I almost thought I had misunderstood the porter's directions. 'Monsieur Comte?' I inquiringly said.

'It is I, sir,' was the answer.

The change in his appearance intimidated me, and I hesitatingly mentioned my name. At once he put out his hand and drew me into his sitting-room. Here I was able to remark the wonderful change

which had come over his expression since we had last met. He now reminded me of one of those medieval pictures which represent St Francis wedded to Poverty. There was a mildness in those attenuated features that might be called ideal rather than human; through the half-closed eyes there shone the very soul of him who had doubted whether he had anything more than intellect. 'I did not recognise you,' he said, opening a drawer; 'but I think of you almost daily. See, I still have your box, and I keep my seals in it, so that I am often reminded of you.' He spoke unreservedly of the honourable poverty to which the last revolution, in depriving him of his modest competence, had reduced him, and he told me how the generous sacrifices of some of his disciples had relieved him of the cares of material existence.

He indulged me with a long conversation, every word of which filled me with fresh wonder. He was no longer the rigid thinker, regular and passionless as mechanism; he seemed to have renewed his youth, to have added something to his former self, but how or what, I could not at the time imagine. In terms unintelligible to me, he referred to relations which had given impulse to his affections; he spoke with enthusiasm of the Italian poets, and of Shakspeare and Milton, whose works he had learned to read in the original; and—O surprise!—taking from his chimney-piece a well-thumbed copy of the *Imitation*, he said: 'I read some pages of this book every morning.'

I already had had cause to suspect that under that frigid mask which he wore in earlier years, an impulsive nature and warm affections were concealed; I had heard at the time that the little keepsake I had brought had pleased him so much, that in speaking of it a few days afterwards his eyes glistened; I understood, therefore, that far within him was a loving soul; and I now learned, from a book which he gave me, the story of how he had found and lost the counterpart, the other half, which he had so long sought. The history of the platonic love to which he owed the late development of his affections, is a strange one, and the story of its heroine one of the saddest in the history of crime.

Madame Clotilde de Vaux was the wife of a man whose misconduct had brought upon him a condemnation to the galleys for life. If not the original of the *Maitre d'Ecole* in the *Mysteries of Paris*, his career had been too similar to the one so hideously drawn by the novelist. This lady united to youth and an unspotted reputation, a poetic temperament and literary talents of a high order. She was pining in cheerless solitude, neither wife nor widow, a state void of hope, and incapable of forgetfulness, when she met Auguste Comte, the man of austere morals and unengaging manners, but towards whom she felt the secret attraction I have spoken of. The acquaintance quickly ripened into a friendship, which before long became an absorbing though platonic passion. It was she who had opened to him the treasures of poetry, she was the Beatrix who awoke in him the feelings of affection, and under whose guidance he trod the ideal world of Shakspeare and Dante.

So greatest and most glorious things on ground
May often need the help of weaker hand.

It was a friendship late found and early lost, for the lady was cut off in the prime of her years. But her influence did not cease with life; her image haunted him like a celestial vision for the remainder of his days. In her he imagined that he had seen humanity carried to that highest perfection which he believed to be the end of our destiny, and he united her in his prayers with his mother and a female servant who waited on him to the last.

To one who had known Auguste Comte in former

days, nothing can be more striking than the terms in which he writes of all these in the preface to his *Positivism*; his self-reproaches for his want of tenderness—he had never failed in duty—towards his mother, his unbounded veneration for his St Clotilde, and his respect for the enlightened ignorance of his unlettered servant, afford a psychological study as curious as it is touching.

In the beginning of last September, I was again in Paris. As soon as I had fixed myself in lodgings in the same studious quarter in which I had first known him, I sought out the abode of my old master. It was an autumn evening when I stumbled into the gloomy *porte cochère* of his house. The porter was sitting on the sill of his lodge, knitting a worsted stocking in the twilight. 'Is it here that Monsieur Comte lives?' was my question. 'Yes, sir,' answered the man without rising or lifting his eyes from his work. 'Is he at home?' 'He was buried this afternoon.'

I never received a greater or more unexpected shock. His temperament and his healthy habits seemed to promise a long career; and the last time I had talked with him, he had been speaking of the employments he had marked for his old age, when he should be no longer capable of working at his philosophy, for he had rigorously determined the period when he should retire from what he considered his apostolate.

I shall neither defend nor criticise his system. It is a subject too abstruse for these pages, and to which I could not do justice. That it contains many truths, that it is a wonderful monument of a wonderful mind, few or none will deny, but fewer still will be found to accept his philosophy as a whole. He looks only on the positive, that is, the material side of nature, he has no tolerance either for spiritual weaknesses or spiritual aspirations. He is a system-maker, and in his love for his system, he is unjust both to his kind and to himself. A true child of the Revolution, the qualities which he possesses and which he wants are equally striking; but I do not fear to say that whatever pure morality and true conceptions abound in his works are the genuine productions of Auguste Comte, while the childishness and pedantry which also distinguish them may be laid at the door of the conventional Frenchman.

S N O W - D R I F T .

WINTER's white banner waves on every bough,
The summer flowers and fruits died long ago,
Their grace is gone, their graves are covered now
With tablets of pure snow.

And hopes and joys, sweet blossoms of the heart,
And griefs that only human hearts can know,
In space as brief have lived, but to depart
And hide 'neath mem'ry's snow.

I would not sing of these; my cheerful verse
Can find a happier emblem, as I go
'Mid brier and bramble, nature's primal curse,
All beautified with snow.

Methinks, there springs no 'root of bitterness,'
No stinging care, no thorny shape of wo,
But love may clothe it in a fairer dress,
As these are clothed with snow.

J. J.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 234.

SATURDAY, JUNE 26, 1858.

PRICE 1½d.

THE GENTLE READER.

HAVING written a good deal for the general public without receiving any acknowledgment from that particular member of it, the Gentle Reader, I, for one, am not going to flatter him any longer. It is my private belief that he never purchased a book in his life. I doubt whether he ever even went so far as to subscribe to a library. I believe him to be a sort of person who borrows volumes from the book-shelves of his friends, and writes in pencil his idiotic remarks upon the margins of them. It is exceedingly improbable, if he does buy books, that he ever bought any of mine, because, in plain truth, the Gentle Reader is unavoidably a fool. Otherwise, would authors, who are conscious of having been insufferably stupid and prosy, or of being about to become so in their next chapter, so unanimously appeal to his good-nature and foolish forbearance? They take such liberties with him, and place him in such positions as would be resented by any person of proper sense and feeling. When a love-scene is about to be described at any intolerable length, the Gentle Reader is commonly lugged in as a third party, and made a confidant of, whether he will or no, by the two silly young folks.

It is, first of all, fawningly insinuated that he, the Gentle Reader, knows all about it, being, as he is, so fascinating an individual, and having been the object of adoration of so many hearts; and then the whole tedious matter is laid before him in all its turtle-dove monotony, while the melancholy details are dwelt upon with a sentimental distinctness, to which impropriety itself would be almost preferable.

In descriptions of scenery especially, this patron of the novelists has to go through a very great deal for their sweet sakes; he has to accompany them, if he will be so good, to inaccessible heights, where the foot of man has never before trodden, and where the shriek of the goshawk, or other bird unknown except to ornithologists, alone is heard; or he has to wander among hanging woodlands, hand in hand with the writer, until he is deposited upon a dampish bank, by the side of a stream, whose course is presently compared, at prodigious length, to the life of man. When the novelist, indeed, is inclined to moralise, the Gentle Reader is apostrophised as though he were Lord Bacon, or Dr Paley, and made accessory to the most uninteresting and illogical sentiments of the author's, respecting being and human responsibility. If religion be the subject, the Gentle Reader is made a party to the strangest 'views,' and that sometimes by no means in the pleasantest manner; his opinions being taken to be identical with those of the writer, not as

a matter of course, but as one about which, on the contrary, there existed no little suspicion: he is regarded with an eye not so much of respect as of a certain affectionate watchfulness, and his supposed scruples are combated with a sort of tender authority, as though the author were his father-in-law, and an archbishop. In battle-scenes, again, and stirring incidents of that kind, this slave of literature is commonly carried to a slight acclivity, commanding not only a good general view of what is going forward, but—to judge by what he is made to see—a very particular one also; and I have even known the Gentle Reader, upon one occasion, to have been shamefully inveigled into a tree, under promise of becoming spectator of a deadly combat, only to be compelled to listen to some heroic verses of the seducer, who, taking advantage of the poor fellow's stationary position, inflicted a good three dozen. Nobody but a very weak-minded person, indeed, would suffer himself to be treated in this manner more than once, whereas there is no more cessation than limit to the persecution of the Gentle Reader. That he is put upon thus remorselessly, and attacked with this impunity, that every scribbler hails him as his friend, and leads him through all the stupidest scenes by the button-hole, is, no doubt, because of his gentleness. The Gentle Reader is unable to say no, or bo to a goose-quill. No author dares to treat the Reader—pure and simple—in any such way. On the contrary, his connection with that gentleman is wholly of a business character, and no obligation is supposed to be upon either side. The Courteous Reader, even, is not so great a ninny as the subject of this paper, and is addressed, with hat in hand, indeed, but yet as a reasonably ill-tempered individual with whom absurd liberties are not to be taken. Our Fair Readers—who are always in the plural, and, I think, supposed to be the sharers of an eternal friendship which has lasted thirteen weeks at a boarding-school, and who lean over the same pages with arms round each other's necks, and in mutual tears—are trifled with somewhat, and not set at a very high intellectual estimate; but still they have not that catholicism of character which admits of their being so continuously ill-treated as the Gentle Reader. The Dear Reader is only apostrophised by female writers, who endeavour by that unjustifiable emollient to blind the judgment and enlist the affections on their side.

The General Reader is at the head of a totally different class. He is, in the author's eyes, the ring-leader of the unappreciating and illiterate mob; of that faction—and it is sometimes considerable—which is sure to decline to read, and far more to buy, his

book. When a chapter is about to be devoted to a subject which the writer does not quite understand, or is about to be filled with got-up and unnecessary technical expressions, the General Reader is warned off in the opening sentences, as by a trespass-board. He is recommended, in a foot-note, to buy another work of the author's, written in a more popular style, and not to read any more of that which he has in his hand, because he won't understand it. The Intelligent Reader, and the like, are, at the same time, flatteringly beckoned on, it is true; but everybody knows pretty well what is coming, and skips the chapter. This notice to the General Reader is the first open declaration of that contempt which the author secretly entertains for many even of his own clients. A sneering reference to the Casual Reader speedily follows. The Casual Reader will not peruse, and will not understand if he does peruse; will not be entertained, and if he is entertained where no entertainment is meant, ought to be ashamed of himself; will fail to mark, or, having marked, will not be able to carry it in his mind to the place where it will be useful to him; will skim too hastily—in fact, the Casual Reader is periphrastically informed that he had better shut up the book, go home, and get to bed. Having thus lashed himself into fury, and the worst passions of his professional nature being fully aroused, the author throws aside the last rag of courtesy, and falls tooth-and-nail and steel-pen upon the Vapid and Irreflective Reader himself. He has been waiting for him for some considerable time. The bonds of sympathy between the writer and the public have been long gradually loosening, and are now utterly dissolved. Scarcely anybody is ignorant that, under the name of the Vapid and Irreflective Reader, the author is, in reality, anathematising everybody. Upon that unfortunate subject he avenges himself, with a hideous malice, for the servile adulation which he has lavished, in other places, upon the Gentle Reader, and others of that kidney. The slave, as generally happens, is now become the tyrant. Growing duller and duller in the matter of the work he is composing—and what is more, being well aware of it himself—he waxes fiercer and more intolerant against that increasing majority of the reading public who are unlikely to read him. The only person, indeed, who can be compared to the Vapid and Irreflective Reader as a type of all that is base and foolish, is that equally denunciated individual, the Sinner, who is the target of the divines. In the latter case, by some fortunate arrangement of our ideas, we rarely associate the object of so much invective with ourselves; but, in the former, we cannot fail to recognise some of our own familiar lineaments. Still, there is in this an honest outpeaking and an acknowledged misunderstanding between the author and his unappreciators, which is to me infinitely preferable to that hypocritical deference he pays to the Gentle Reader. Any allusion to him—and, indeed, to any Reader—only helps to destroy what little reality the writer may have had the good-fortune to invest his scenes with, and to break that web of fancy which, Apollo knows, it is hard enough for him to weave. Moreover, as I have said—and this consideration has much weight with me—there is little or nothing to be got out of the Gentle Reader. The very mention of him, indeed, is a literary toadyism; from the practice of which, as of all other toadyisms, no true benefit can be ever possibly derived. Therefore, though my brethren of the pen may tremble at my audacity, and the unaccustomed public knit its indignant

brows, I hereby declare that I do not care three halfpence—the absurdly ridiculous price of this superlative periodical—whether this paper of mine shall please the Gentle Reader or not.

'THE GARDEN OF FLOWERS'

THE eager craving after knowledge evinced by all classes of the community, has, in these latter days of the world's history, summoned into existence an immense number of books treating of every science and art, from astronomy to angling, in what is generally termed a popular manner. A popular work on science, however, is not the one thing new under the sun. A certain Antonio Torquemada wrote and published a book of this description in Spain, as far back as the middle of the sixteenth century; and it achieved a very widely extended popularity for itself. It was translated into nearly, if not quite, all of the European languages; bibliographers reckon its editions by hundreds. Nor need we be surprised at the general favour in which it was held. To an attractive title, *The Garden of Flowers*, it added about six hundred of the most marvellous stories, selected from the various authors then considered the standards of scientific knowledge. These metaphorical flowers of the garden of science are pleasingly and appropriately introduced to the reader as the conversation of three friends—Antonio, Bernardo, and Ludovico—in a real garden decorated with natural flowers. In most instances, each speaker, as he adds his flower or story to the collection, assigns his authority, saying—'as Pliny hath it,' 'as it is written in Solinus,' 'as it may be seen in Olaus Magnus,' and so forth; the fathers of the Church, too, are frequently quoted in a similar fashion, and the whole forms a very remarkable reflex of the state of general and natural science at the period in which it was compiled.

Like the progress of an explorer of a new country, the world's advance in knowledge can only be correctly estimated by looking back to the landmarks left on the ground already passed over. Thus the *Garden of Flowers*, we could not have a better landmark for this purpose. It was long the companion of the grave and learned, and was dedicated to a ripe scholar, Sarmiento de Soto Mayor, bishop of Astorga, rejoicing in as many other names, designations, and titles as none other than a Spaniard could possibly possess. Let us then, hand-in-hand, friendly reader, enter this antique garden, and discover what was the general knowledge among men of learning about three hundred years ago.

The three friends, having met in the garden, sit down, under the shade of a tuft of trees, on the bank of a river; and soothed with the pleasing sound of the clear stream and murmuring of the green leaves, contemplate the flowers—'so diverse in form, so dainty in colour, as if nature had used her extreme industry to shape, paint, and enamel them.' This naturally leads the conversation to the works of nature in general, which forms the first day's discourse or chapter, entitled, 'Many things worthy of admiration, which nature hath wrought, and daily worketh in men, contrary to her common and ordinary course of operation.' Here we read of whole nations having heads like dogs, and feet like oxen; of a tribe of one-footed people, and of several varieties of tailed men—some having tails like those of peacocks; others whose vertebral terminations resembled those of horses; while a third had thick bushy tails like foxes. Indeed, there could be no doubt about the latter, for Bernardo speaks of a man of fox-tailed men that then existed in Spain. Their ancestors had offended a certain St. Torobius, who thus punished them in *secula seculorum*. It may now be generally known that a similar story is still told of

a district in England. St Augustine is said, by our old monkish chroniclers, to have endowed the people of a part of Kent with tails like fishes, because they preferred fishing to listening to his sermons. But though the story is still alluded to as a vulgar reproach, we must say to the reader, in the quaint words of our author, 'you commit no deadly sin though you believe it not.'

After a long discourse about Amazons, the three friends speak of 'a fierce people and of great courage, though only three spans in length,' called pigmies. 'They inhabit the utter part of India, toward the east, near the rising of the river Ganges, where, at such times as it is in other places winter, the cranes come to lay their eggs, and to bring up their young ones, about the river-sides; whose coming, so soon as the pigmies perceive—because they are so little, that the cranes regard them not, but do them much hurt, as well in their persons as in eating up their victuals and spoiling their fruits—they join themselves in great numbers to break their eggs. And to prepare themselves to this terrible fight, they mount upon goats and rams, and in very goodly equipage, go forward to destroy this multiplication of cranes, as to a most dangerous and bloody enterprise.'

Of the existence of the pigmies, the friends have no manner of doubt. They tell us that the Tyrians, whose commerce led them to the extreme ends of the earth, retained numbers of these valiant little people as mercenary soldiers; that, in short, the pigmies are no other than the Gammadina, who hanged their shields upon the towers of Tyre, as we may read in the twenty-seventh chapter of the book of Ezekiel. And we must ourselves add, that the belief in a nation of pigmies prevailed to a comparatively late period. Few of the old museums were without the skeleton or embalmed body of a pigmy; and it was no earlier than the last century, when Dr Tyson, in an elaborate anatomical work, first proved that all those embalmed bodies and skeletons were the remains of monkeys.

From the dwarf to the giant is no more distant a step, than from the ridiculous to the sublime. One Bocacius, who saw it himself, is given as the authority for the following story: 'Near Trapani, in Sicily, certain labourers, digging for chalk under the foot of a hill, discovered a cave of great wideness. Entering into the which, with light, they found sitting in the midst thereof a man of such monstrous hugeness, that, astonished therewith, they fled to the village, reporting what they had seen; then, gathering together in greater number, with torches and weapons, they returned to the cave, where they found the giant, whose like was never heard of before. In his left hand he held a mighty staff, so great and thick as a great mast of a ship. Seeing that he stirred not, they took a good heart and drew near him; but they had no sooner laid their hands upon him, than he fell to ashes, the bones only remaining—so monstrous, that the very skull of his head could hold in it a bushel of wheat. His whole skeleton being measured, was found to be 140 cubits in length.'

To arrive at such a size, the man must have lived a very long time; so we are next treated with accounts of persons, who had lived from 200 up to 500 years. Centaurs, mermen, and merwomen, next furnish subjects for the most ridiculous stories. We are told that a family, appropriately termed Marins, then lived in Spain, who were the descendants of a merman. These Marins were webfooted and scaly. They lived principally on raw fish, which they caught with their hands while swimming in their great-grandfather's native element, being, as may readily be granted, the expertest of swimmers.

A fountain in the garden suggests the topic of the second day's conversation—'On the proportions and

virtues of springs, rivers, and lakes.' We have little, however, about the objects specified, springs and rivers leading the conversation to the four great rivers mentioned in Scripture as surrounding the garden of Eden; and nearly the whole chapter is taken up with a discussion respecting the exact site of the terrestrial paradise. This, though a favourite subject of discussion at the period, forms a terribly dry one now; so we shall pass on to the next day.

The third day's conversation turns upon 'fancies, visions, spirits, enchanters, charmers, witches, and hags.' After a deal of curious matter, the friends come to a conclusion, as contrary to that of Aristotle and the ancients, as it is to the ideas of the modern ghost-believers and spirit-rappers—namely, that all apparitions proceed from the devils alone. We are told that there are six degrees of those very numerous and troublesome gentry. The first, in the upper regions of the air, attends to thunder, lightning, hail, and snow; the second, in the lower part of the atmosphere, causes heavy rains, blights, frosts, storms, and whirlwinds; the third, on earth, has quite enough, indeed too much, to do with the affairs of man; the fourth, in the waters, presides over inundations and shipwrecks; the fifth, in the upper strata of the earth, occasions earthquakes, and accidents in mines and wells; the sixth, still lower down, is actively employed in the place unmentionable to ears polite. Among all these, there are well-defined gradations of rank, from the 'arch-enemy' Satan himself, down to the lowest stoke.

We here learn how it was that witches and wizards were generally deserted, in their utmost need, by the fiends with whom they had formed engagements. In their ignorance, they had made contracts with low, vulgar demons, that had neither power to fulfil, nor sufficient honourable feeling to carry out, their engagements. In all cases, however, when the bargain was made with a demon of rank, the terms were most honourably fulfilled, though the extreme penalty of the bond was always exacted. Indeed, some necromancers of superlative cunning and audacity, managed to cheat the demons—'turn a corner jinkin', as Burns says; but of such highly presumptuous and dangerous experiments, the less said the better. Necromancers who wished to possess a private demoniacal attendant of their own always at hand, could have one confined in a ring, button, box, phial, or other small portable article; but, as a high-caste demon would not submit to such confinement, and a low-caste one could not be depended upon, it was usual in such transactions to secure the services of a low-class fiend, at the same time taking a bond for their due fulfilment, from one of the upper ten thousand in devildom. The best thing, however, that a magician could have a devil confined in was a horse. He could then make journeys of incredible distance in the shortest periods, and always find profitable employment for the imprisoned fiend; an object sometimes of very great consequence.

Of planetary influence, we are told a curious story, to the following effect: Abel, the son of Adam, foreseeing the deluge, and naturally anxious that the recondite secrets, so dearly purchased by eating the fruit of the tree of knowledge, should not be lost to mankind, wrote a book on the virtues and properties of the planets, and enclosed it in the centre of a large stone. Long after the great cataclysm, Hermes Trismegistus found the stone, opened it, and took out the book, by the contents of which he profited most wonderfully. This antediluvian book subsequently fell into the hands of St Thomas, who, in turn, managed to perform many great and admirable feats by its assistance. On one occasion, the saint, while sojourning in a certain city, being seized by a severe sickness, was much annoyed by the noise of horses and carts traversing the narrow street in which

he dwelt. So he prepared two images, according to a prescription made and provided in Abel's ancient book aforesaid, and having burned one of them at each end of the street, no horse or other beast of draught or burthen could ever after pass the spots where those images were interred. He also made another image, from directions in the same book, and threw it into a fountain; and the effect of this wonderful image was such, that every picher touched by the waters of that fountain immediately fell to pieces. This certainly seems to have been a very mischievous trick, even though perpetrated by a saint; and it also savours of a tampering with forbidden arts. But our author sets us right on the latter score. Using the influence of the planets, he tells us, is so very lawful, that nothing can be said against it; but the other kind of necromancy, used and practised through the help and favour of the devil, is a very different affair indeed.

There is nothing novel in the ghost stories in this chapter; they are of the regular stereotyped kind, long and still known over all the world, though here localised by assuming a Spanish character. And as we are given to understand that those appearances were not disembodied spirits, but merely illusions caused by devils, the accounts of them lose that cold charnel-house-like connection with death, the grave, and our own humanity in its future form, which constitutes the great charm and interest of what we may term a legitimate ghost story.

Many supposed apparitions, however, were merely natural events, to which men, in their superstitious fears, attributed a spiritual character. As an instance of such, we are told of an occurrence that took place at Benevento, the very town where the garden-scene is laid. An industrious matron, having risen before day one morning, to finish some pressing household work, sent her servant to light a candle at a lamp that was always kept burning in a neighbouring church. The sleepy girl, slightly dressed in white night-clothes, losing her way, wandered over half the town, before she reached the church, and then, too stupid to give any explanation, frightened a silly sexton before she returned to her mistress's house with the burning candle. But, in the meantime, the mistress herself, not choosing to wait in the dark, set off for the church, and also returned with a lighted candle in her hand. Now, it happened that a sick neighbour saw the two women, and his mind being weakened by disease, magnified their number to a considerable extent. The sexton partly corroborated the sick man; and as the story travelled, the number multiplied till the middle of the day, when it was currently reported and believed that a penitential procession of two thousand ghosts carrying lighted tapers had passed through the town during the previous night. For, says Ludovico, who tells the story, 'let but one such matter as this come amongst the common people, and it will grow so, from mouth to mouth, that at last of a unite they will make an elephant.'

The fourth day's discourse, suggested by the arrangement of the flowers in the garden, is upon 'chance, fortune, destiny, luck, felicity, and happiness—what they signify, the difference between them, and many other learned and curious points; and forms a very interesting chapter, far in advance of the age in which it was written. Astrology, and the supposed influence of the stars, at man's birth, on his future destiny, are treated as ridiculous absurdities; while ignorance and misconduct are shown to be the principal causes of human misfortunes and miseries. Here Antonio tells a story of some mowers, who found, in a meadow they were cutting, a miserable leper that had crawled thither to die. The contagious nature of the disease, and the hideously disgusting

state of the poor wretch, deterred them from attempting to render him any assistance. On going to their mid-day meal, however, they found that a viper had crept into and been drowned in their wine-jar. Was thus rendered so deadly poisonous they could not drink; but thinking it a pity that it should be wasted, they concluded to give it to the leper, and thus charitably put him out of his exceeding misery at once. Accordingly, they did so; but, to their great surprise, instead of dying instantaneously, as they had expected, the leper became rather jolly than otherwise. In short, the mowers, instead of being philanthropic poisoners, as they thought, were a sort of pre-Hahnemannite homœopaths; for the venom of the viper counteracted the virulence of the leprosy, and the man was not killed, but cured. 'So,' continues Antonio, 'as all herbs, beasts, and stones contain good and profitable virtues, we should not attribute to the stars the misfortunes that befall us, but rather to our own ignorance, which delays us from properly administering to our health and happiness. Concluding, therefore, I say, that pestilential and infectious diseases are not caused by the stars, but by matters of the earth itself infecting the same dead carriages, corrupted carcasses, stinks, stonks, and putrid water, and many other filthy things.' The belief in the influence of the stars has long since passed away, but there are many still among us who might glean sound useful information from the above passage.

The fifth and sixth chapters treat 'of the septentrional regions, and many things pleasant and worthy to be known.' In other regions, we are told that the sea is the mother of mysteries, but in the septentrional or northern, it is the mother of monsters. (One fish, indeed, the head of which was sent by the Primate of Norway to Pope Leo X. was called the monster: it had no other name, and well deserved to be so termed. According to Antonio's description, 'its length is commonly about fifty rods, which is but little in comparison with the greatness and deformity of its proportions and members. Its head is as great as half its body, and round about full of horns, longer than those of an ox. It has only one eye, a cubit in length and a cubit in breadth, which by night glittereth in such sort, that afar off it resembleth a huge flame of fire. Its teeth are great and sharp; its body full of hairs, resembling the wing-feathers of a goose; and its colour is as black as any jet in the world may be.'

Then Bernardo, not to be outdone, gives the following account of another odd fish that was caught in 1517, in a river of Germany. 'Its head was like unto that of a wild boar, with two great tusks shooting about four spans out of its mouth. It had four great feet, like to those with which you see dragons usually painted; and besides the two eyes in its head, it had two others in its sides, and two in its belly; and on the ridge of its neck certain long bristles, as strong and hard as though they had been iron or steel. This monster was carried to Antwerp, and there live many who will witness to have seen the same.'

Among a number of wonderful fishes, we only mention another, found in the rivers of Sweden. Its name is trevis; it is black in winter, and white in summer. 'Its marvellous property is such, that binding it fast with a cord, and letting it down to the bottom of the river, if there be any gold on the sands thereof, the same cleaveth fast to its tail, which, how great soever the pieces may be, fall off from it till they be taken off; so that some persons in that country use no other occupation to earn their living than this.'

Coming to our own shores, Antonio says: 'There is a town in Scotland, the benefit arising to which

from an abundance of ducks, is so great and wonderful that I cannot pass it over. There is, near this town, a mighty great and craggy rock, to which, at breeding-time, these fowls come flocking in such quantities, that they resemble immense dark clouds rather than anything else. The first two or three days they hover aloof, flying up and down about the rock; during which time, the people of the town stir not out of their doors, for fear of frightening them. The ducks, seeing all things silent and still, settle themselves boldly, and fill the rock with nests. Their sight is so sharp and piercing that, while fluttering over the sea which beateth on the same rock, they see the fish through the water, which—incontinently plunging themselves into the same—they snap up with such facility, that it is scarcely to be believed but by him who hath seen it. Then the towns-people, knowing the ways and passages, get up into this rock, and not only sustain themselves by the fish which they find in the nests, but maintain a great traffic by selling them in other towns. When they perceive that the young birds are ready to fly, the people—in order to enjoy the benefit of the fish the longer—pluck their wings, detaining them in the nests many days, and at last take and eat them, their flesh being very tender and of good smack. These ducks are never seen in that region but at such time as they breed, and though the people kill numbers of them, yet they never fail to come as many as the rock can hold. The generality of wonderful stories are founded on some slight substratum of truth; through the foregoing cloud of exaggeration, our clearer eyes can readily perceive the Bass Rock and its feathered tenantry of gannets.

The sixth and last day's conversation was held in an arbour of sweetly-scented jessamine, where, in the intervals of speaking, the ears of our three ancient friends were regaled with the sweet and delectable song of nightingales, which, in their opinion, far excelled the curious forced harmony of musicians. As we must part with them, we surely cannot leave them in a more pleasant place; and so, at once, we shall say farewell to *The Garden of Flowers*.

A RIDE ACROSS SARDINIA.

ASSUMING, dear reader, that you are not tired of Sardinia, or out of conceit with those dear wild creatures who inhabit it, I propose to take you across the island to Cagliari. You go by rough paths, over lofty mountains, attended by a guide who is quite a character. He carries a long rifle, and wears a slouched hat; is acquainted with everything and everybody; he is an intimate friend of the terrible bandit, whose stronghold you have to cross; he is on most affectionate terms with the padres of the different villages; and to know the village priest, is to know everybody. Well, you must trust yourself—horse and limb, money and all—to him for the next few days or weeks, and he will not fail you; he may just courteously cheat you out of a stray scudo or two, in the way of business—first, because you are an Englishman, and, of course, supposed to have mines of wealth; and, next, because you are a heretic—so the saints would only smile on the fault. Beyond this, he will do nothing to harm you: on the contrary, at each village, as he passes along, he will spread your name and fame before you, so that there will be a positive rush to catch a passing glimpse of the grand 'Milordo Inglese'—not that they have the smallest idea of what a Milordo Inglese really means—an 'Inca of Peru' would be quite as intelligible to them. Meanwhile, there is at this season—end of May or beginning of June—a lovely sky, a country teeming with a varied and most abundant vegetation, not perhaps highly cultivated, but tilted

in a simple and primitive manner. The vineyards are especially luxuriant—no wonder that the wines of the island are so superior to those of Italy—the olive-grounds extensive and productive; and then the orange-groves—you realise the garden of the Hesperides at Millis, and positively ride for miles through an orange-grove. But we are travelling too fast: we must halt long enough before getting to Millis; and how pleasant it is to watch the unpacking of those huge *bisacce*: a piece of roast wild boar—excellent!—birds boiled and rolled in myrtle-leaves—Umph! you say. Ah, they don't look so well as they taste! Very white bread, and very red wine—green myrtle-branches for dishes and plates, and cut myrtle-twigs for forks—a hunting-knife to carve with. But the sun is very hot, and you can take a siesta under these lovely trees—on that sweet bank of wild-flowers, without any fear of cold, cramp, or rheumatism. And what wild villages you pass through—some smiling, cheerful, healthy; others squalid, dirty. Alas, alas; and here, in these low, ill-drained situations, will presently come the dreaded *intemperio*, the scourge of this beautiful land. The season is early yet; you will, I hope, escape it; but see how your guide muffles up his head at sunset in the hood of his rugged *cabanedda*, surmounting the whole with a red cotton pocket-handkerchief. He has had it once, and dreads it. You laugh at his precautions. Take care! And now you wonder where you will halt at night, for *locandas* there are few. You need have no care for this in hospitable, kindly Sardinia, only you must not always carry your ideas of fastidious refinement with you; they will occasionally cause you trouble and vexation of spirit.

The kindly dwelling of a *collicatore* or a village priest, with its simple and unpretending appliances, will be ever ready to welcome you; and what an amusing compound of extreme goodness, ignorance, and superstition is this same village priest. Like his native *molenta*, how carefully does he revolve in his little orbit of daily duties, doling out his kindnesses; ay, and his charities and hospitalities also, on the miserable pittance assigned him for the cure of souls. He will give you a marvellously good supper, good wine, and perhaps a good joke too, for they are not ascetics; but then, after supper comes bed, and with beds in Sardinia come fleas also—not in pairs, dear reader, not even in small social parties—alas, no; these sanguinary little monsters, form themselves into heavy brigades, and make the attack *en masse*.

But you have a letter of introduction to the Seigneur of —; your guide has been long desecanting on the grandeur of his house at Sassari, and also of his *campagna*, which you are now rapidly approaching. You have for many hours been within his feudal domain.

You, somehow, can connect feudalism only with the middle ages; but here, in this far-off, antiquated, out-of-the-way land, you are in the very midst of it. The impression on your mind, drawn from the vivid picturing of the old priest last night, and of the guide all the morning, falls sadly short, as you behold the large tumble-down, queer-looking building, which for some centuries has from time to time received within its walls the successive representatives of the F— family during the hot summer months. You have a recent and very vivid recollection of fine English country-seats, and pretty country villas in England, with their smooth lawns, and all their elegant accessories, and are not prepared for such a combination of power, pride, and plainness. We must go first into the court—see the rough sheds for still rougher implements of tillage; the unsophisticated stable, tolerably furnished with snorting and kicking little horses; and the noble-looking, pale-brown, large-eyed, large-horned bullocks, which drew hither the cart

containing the signora, the young ladies, and their female attendants, but three days ago. There, under yonder shed, is the *ne plus ultra* of antique and clumsy contrivances, in which they were dragged—one can hardly say drawn—over stones as large as your head, jolting, creaking, and tumbling; and sadly bruised they would have been, but for the family supply of wool-bedding which wedged them softly and tightly in.

But the guide has announced you with every flourishing title his inventive brain could suggest; it is in vain that your English taste for truth rebels; he has you at his mercy, and you have no chance of convincing him that you are not the Lord Chancellor, or her Majesty's prime-minister, travelling *incog.* on her Majesty's private service.

Forth come a troop of clamorous dogs, and another troop of equally clamorous domestics, the very antipodes of our solemn and decorous Johns and Sarahs; and there, somewhere in the midst, stands the seigneur himself, hat in hand. He has a kind and courtly look; one may read his Spanish descent in every line of his high-bred features. There is pride, too; but not of that quality which degenerates into insufferable insolence. No; he estimates himself somewhat highly, perhaps; but in doing so, he has no desire to depreciate you. He is delighted to receive you, and he tells you so—your advent is an immense relief to the monotony of his country-life.

I may just whisper in your ear, *en passant*, that he has very few resources—the idea of reading has not struck him particularly; he has practised it but little since he left the Jesuit's College at Cagliari; he delights in the wild-boar hunt, and takes great interest in the success of his vineyards and olive-grounds, from the produce of which, and the mulct exacted from his fensars, his income is principally derived. Well, the seigneur triumphantly ushers you into his ancestral *casa di campagna*. There are many apartments, furnished with extreme simplicity. It is plain, the *villeggiatura* is a sort of encampment. The seigneur gives some orders to the domestic throng who buzz and clatter about him; some macaroni and tomatoes are drawn forth from an ancient-looking walnut-wood *armadio* in the principal *sala*, and, after much chattering and gesticulating, hauled away to be cooked. Meanwhile, you are courteously offered some fruit and wine, by way of temporary refreshment; after which you stroll out to look after your good little horse, in whose well-being you feel by this time intensely interested—his sure-footed sagacity having spared you many a terrible fall—and you begin to regard him as a thinking and reasoning being. After many mutual caresses, you take your leave of him to lounge round the *campagna*, which you find a perfect labyrinth of orange, lemon, and mulberry trees, though with open spots here and there adorned with a few flowers, wildly scattered, and but carelessly tended. Your English notions of smooth lawns and gay parterres vividly suggest themselves; you wonder that something of the kind has not been thought of here, where nature is so bountiful; you wonder, too, whether the pretty, dark-eyed, sylph-like *damigella*, of whom you accidentally caught a glimpse at an upper balcony, does not love flowers; and, if so, why she does not amuse herself by tending the graceful things she so much resembles.

And now you are rather anxious perhaps to stray beneath that magic balcony, for you fancy you heard the lovely arietta in *Anna Bolena*—

Al dolce quidami,
Castel natio,
Al verdi platani,
Al queto rio, &c.,

in the softest and fullest of female voices.

But here comes the marchese again, bringing along with him a priest, a certain Padre Benedetto, to whom you have no particular care to be introduced. The priest, like many other Sard priests, has large broad features, high cheek-bones, round bead-like black eyes, and peculiarly dark unctuous complexion: he takes snuff prodigiously, uses a red cotton handkerchief—makes you a bow and a compliment at every third word. You consider him decidedly a bore, and his loquacity is becoming intolerably irksome, as you wish to hear the remainder of the lovely arietta, now in full progress—you, in self-defence, make bows and interjections in return, still straining your ears to catch the dulcet sounds; and just at

Cota dimentico,
De corsi affanni,

there comes an official, the *maggior duomo*; he makes bows more profound than the padre, and in flourishing terms, and with many allusions to your *signoria illustrissima*, announces dinner. Dinner—it has an imposing sound, it is an era in the day, especially in the travelling day—it is the rest for man and horse during the noontide heat. Let us see what the marchese has for dinner. The table is laid in approved style: there is a tower of luscious fruit in the centre; little appetite-exciting condiments at the corners, such as anchovies, hot pickles, dried sausages, &c. These are barely touched, for here comes the *minestra* with its grated cheese—not soup, dear reader, good or bad as you are accustomed to meet with it—for *minestra* is broth flavoured with grated cheese, and slightly thickened with vermicelli. And now come a host of dishes, all different in taste, but all composed of one kind of meat.

This, you would never have discovered, had it not been for the over-anxiety of your host, who laments in fervid tones the total absence of game, fish, and poultry; tells you that had he had the smallest hint of your visit, he would certainly have procured them; but he has not hunted since his arrival; and there is not a market within—I dare not say how many miles—not a shop: so he had no time—no opportunity.

The secret, therefore, is, that out of the sheep killed for family use, some additional dishes have been concocted, much to the honour and glory of the marchese's *chef de cuisine*, who, no doubt, is all this time secretly rejoicing at this opportunity of making a signal display of his culinary skill. And really—barring a rather generous expenditure in the matter of oil and garlic—you are very much of his opinion. Meanwhile, as the repast progresses, you become nervously curious as to the sounds in the house; you expect each time any of the huge doors are opened, to see the houri of the balcony; but she comes not, as you give her up in silent despair. You are not aware that some fragments of old Spanish customs yet linger here, and that this is one: you will not see her here; you might probably see her at church when in the capital; or on the public walk, well attended by a matronly duenna, or just possibly at the opera; but she is well watched and guarded: most likely, she is betrothed to some neighbouring marchese, and will shortly be united to him without much consultation of her individual fancies.

In the meanwhile—and as you are brooding over your disappointment—on speeds the dinner. Some apricots, lightly fried in boiling oil, and dusted over with sugar, are really exquisite. You testify your approval, whereupon the domestic who is replenishing your plate is enchanted, and loudly commends your taste. You, accustomed to liveried automatons of the Jeames style, are perfectly thunderstruck at his audacity, but perceive that it is perfectly well received. And now the little tower of fruit is attacked; and very excellent coffee and cognac

supersede the wines, which were superlative. The padre, after a very elaborate application of the orange-wood *stocche* to his very unpolished teeth, has subsided into a quiet siesta, from which he will not awake for two good hours. The marchese is hovering between politeness and intense drowsiness; he has strained his eyes three times to make you a suitable reply to an observation; and at length—just as he tried to remark to you that he had heard at Terra Firma that England was a magnificent city—his words died away in a deep sonorous snore, to which, induced by example, you yourself at length willingly respond. So now, again, I say for the present, *addios*.

MORE BIRDS AS OBSERVED BY ME.

IN Peeblesshire, amongst the green rounded hills of the south of Scotland, is the sweetly retired pastoral Vale of Manor, permeated by a little clear stream, in which it was my delight in school-days to throw my rod and line. I could tell every pool where a trout lay. But I advert to the stream now with a design of saying a little about the water-ouzel or water-crow, which I was wont to observe while engaged in this, my favourite sport. It is a little bird, rather smaller than a mavis, black all over the body except its breast, which is white. It is easily made out by this contrast of colours. Sometimes it was met with perched upon a stone in the middle of the stream; sometimes on the gravel at the very edge; and often flying past, over the centre of the water. There were still two other retreats chosen by this bird—a hole in the bank, or one of the lowest branches of some alder-tree which grew over deep pools.

On being disturbed by any one walking up the river-bank, the water-crow, on rising, as frequently flies down-stream past you, as away up-stream before you. It is not a very shy bird, and, though I should have been sorry to have killed one, still I could not resist having many a shot with stones, as it went whirring over the water in its straight, rapid flight. I never hit one. If you take the trouble of watching the habits of this little bird, you will find the following remarks true: I have observed it carefully before venturing to write about it, and of course I know too, that others have written about it long ago. 1. When standing on a stone in the middle of the water, it has a habit of nodding its head and *threatening* to be off many times, before it opens its wings to be gone; it even partly loses its balance when dip, dipping in this way, though it always recovers itself again. 2. When standing thus, it, for the most part, keeps its head towards you, and more frequently its side than its back. When started, it prefers making the turn in the air, to simply turning itself on the stone—that is to say, if it intends flying from you; but I have as often observed it leave the stone, dive under water for an instant, and then fly past you. If there are companions with you, the water-crow will often quit the course of the stream in its flight past; but when it has flown about a hundred yards, it resumes the water-course, and alights soon: half a circle is often flown over in this way. Sometimes it will do this for a single person even. 3. The water-crow feeds on aquatic insects, the spawn of salmon, &c.; and to get at this food, it dives usually in the streams, and propels itself under water by its wings and feet. This is a strange habit, and gave me much amusement, though it was only upon two occasions I was witness of the fact. It was looking after those small larvae of the may-fly which are to be seen in great numbers cased all over with minute stones and shells. These tiny creatures form the chief food of the bird in May and June, and make capital bait for

trout as well. I once found a nest with three small white eggs under a cascade on the Pentland Hills. While I was standing by the fall, a water-crow burst through it from the inside, and flew fifty yards down the burn, where it alighted. I waded in and got under the water-fall, where I discovered the nest on a shelf of rock, with water dripping on it; the construction of the nest, however, was so ingenious, that though wet outside, the inside was quite dry, and the eggs warm. When I was putting on my shoes and stockings on the bank, the bird returned, and again darting through the torrent, reached its nest. I thought this shewed great courage. These are the only points regarding the water-crow worth noticing, that I can remember.

Of all the birds which help to add to one's enjoyment of summer-time, the one I fancied most was the yellow-hammer, or, as we called it, the yellow-yorlin. This is a simple little bird, and has a song apt to be unnoticed by many, but never by me. I may remark that I have recognised the seasons, spring and summer, not so much from their visible phenomena, as from the songs of birds calling up the association. And summer was not summer for me, unless the yellow-yorlin churmed her simple roundelay from the green hedgerows.

I have often thought that the seasons are ushered in to almost every one by some little favourite association. Thus, spring to you is perhaps not spring without violets, or primroses, or budding trees; for me, the song of the lark, the mavis, the cuckoo—is spring. Flowers are your spring—birds are mine. The same with summer: you cannot think of that season—the word itself cannot be sounded, without your calling up something summer-like, such as green leaves or shady lanes. I see summer at any other time in the year, by thinking of the yellow-yorlin; for the song of that bird has always had the *feel* of that warm season.

If the weather is warm and genial, the song of this bird is sure to be in full measure. Its favourite position is on the top of some hedgerow, where it appears very like a brownish-yellow ball of feathers. The notes begin suddenly and end in a prolonged cadence, something like the following words, familiar to many a school-boy:

If the day happens to be chilly, the yellow-yorlin's notes reach only as far as

A little bit of bread, but no-oh —

with a sudden break-off before coming to the cheese; and if she is not at all in singing mood, she is longer in the intervals, and then contents herself with simply

A little bit of bread.

In cold weather, these notes are sung sharply and quickly, with a kind of shiver; but when enjoying the full meridian sun, she will sit on her favourite hedgetop for an hour at a time, sounding to her mate, as often as once or twice a minute, her plaintive calls for

A little bit of bread, but no-oh cheese.

This fancy about the yellow-yorlin must have often struck many a one; for though its sweet notes may be uttered in vain for many a passer-by, still I know there must be those who have felt the warm ditty strike home, like cheerful words from an old friend. Besides, it so often sits by the roadsides.

I must just add that this little favourite's petitions

for bread in summer-time so many times repeated *then*, were not forgotten when winter came round; for it always came in for a share of the crumbs scattered from the cottage-door.

O Ç E O L A :

A ROMANCE.

CHAPTER XXIII.—DEVILS OR ANGELS?

WAS I enduring the torments of the future world? Were those its fiends that grinned and gibbered around me?

See! they scatter and fall back! Some one approaches, who can command them. Pluto himself? No, it is a woman. A woman here? it is Proserpine?

If a woman, surely *she* will have mercy upon me?

Vain hope! there is no mercy in hell. Oh, my brain! horror, horror!

There *are* women—these are women—they look not fiends; no, they are angels. Would they were angels of mercy!

But they are. See! one interferes with the fire. With her foot, she dashes it back, scattering the fagots in furious haste. Who is she?

If I were alive, I should call her Haj-Ewa; but dead, it must be her spirit below.

There is another; ha! another, younger and fairer. If they be angels, this must be the loveliest in heaven. It is the spirit of Maïmee!

How comes she in this horrid place—among fiends? It is not the abode for her: she had no crime that should send her here.

Where am I? Have I been dreaming? I was on fire just now—only my brain it was that was burning; my body was cold enough. Where am I?

Who are you that stand over me, pouring coolness upon my head? Are you not Haj-Ewa, the mad queen?

Whose soft fingers are those I feel playing upon my temples? Oh, the exquisite pleasure imparted by their touch! Bend down, that I may look upon your face, and thank you—'Maïmee! Maïmee!'

I was not dead. I lived. I was saved. It was Haj-Ewa, and not her spirit, that poured water over me; it was Maïmee herself whose beautiful brilliant eyes were looking into mine; no wonder I had believed it to be an angel.

'*Carajo!*' sounded a voice that appeared hoarse with rage. 'Remove those women!—pile back the fires. Away, mad queen! Go back to your tribe! these my captives—your chief no claim. *Carrambo!* you no interfere. Pile back the fires!'

'Yamassees!' cried Haj-Ewa, advancing towards the Indians, 'obey him not! If you do, dread the wrath of Wykomé! His spirit will be angry, and follow you in vengeance. Wherever you go, the *chitta mico* will be on your path, its rattle in your ears. It will bite your heel as you wander in the woods. Thou king of the serpents, speak I not truth?'

As she uttered the interrogatory, she raised the rattle-snake in her hands, holding it so that it might be distinctly seen by those whom she addressed. At that instant, the reptile hissed, accompanying the sibilation with a sharp 'skirr' of its tail.

Who could doubt that it was an answer in the affirmative? Not the Yamassees, who stood awe-bound and trembling in the presence of the mighty sorceress.

'And you, black runaways and renegades, who have no god, and fear not Wykomé, dare to rebuild the fire—dare to lift one fagot—and you shall take the place of your captives. A greater than yon yellow monster your chief will soon be on the ground. Ho! yonder the Rising Sun! He comes! he comes!'

As she ceased speaking, the hoof-strokes of a horse echoed through the glade, and a hundred voices simultaneously raised the shout:

'Oçeola! Oçeola!'

That cry was grateful to my ears. Though already rescued, I had begun to fear it might prove only a short reprieve. Our delivery from death, was still far from certain; our advocates were but weak women; the mulatto king, backed by his ferocious followers, would scarcely have yielded to their demands. Alike disregarded would have been their threats and entreaties. The fires would have been rekindled, and the execution carried on to its end.

In all probability, this would have been the event, had not Oçeola in good time arrived upon the ground.

His appearance, and the sound of his voice, at once reassured me. Under his protection, we had nothing more to fear, and a soft voice whispered in my ear that he came as our deliverer.

His errand was soon made manifest. He drew bridle, and halted near the middle of the camp, directly in front of us. I saw him dismount from his fine black horse—like himself, splendidly caparisoned. Handing the reins to a bystander, he came walking towards us. His port was superb; his costume brilliantly picturesque; and once more I beheld those three ostrich plumes—the real ones—that had so often mocked in my suspicious fancy.

When near the spot, he stopped, and gazed inquiringly towards us. He might have smiled at our absurd situation, but his countenance betrayed no signs of levity; on the contrary, it was serious and sympathetic. I fancied it was sad.

For some moments, he stood in a fixed attitude, without saying a word.

His eyes wandered from one to the other—my fellow-victim and myself—as if endeavouring to distinguish us. No easy task. Smoke, sweat, and ashes must have rendered us extremely alike, and both difficult of identification.

At this moment, Maïmee glided up to him, and whispered a word in his ear; then returning again, she knelt over me, and chafed my temples with her soft hands.

With the exception of the young chief himself, no one heard what his sister had said. Upon him her words appeared to produce an instantaneous effect. A change passed over his countenance; the look of sadness gave place to one of furious wrath; and turning suddenly to the yellow king, he hissed out the word 'Fiend!'

For some seconds, he spoke no more; but stood glaring upon the mulatto, as though he would annihilate him by his look.

The latter quailed under the conquering glance, and trembled like a leaf, but made no answer.

'Fiend and villain!' continued Oçeola, without changing either tone or attitude, 'is this the way you have carried out my orders? Are these the captives I commanded you to take? Vile runaway of a slave! who authorised you to inflict the *fiery* torture? Who taught you? Not the Seminoles, whose name you have adopted and disgraced. By the spirit of Wykomé! but that I have sworn never to torture a foe, I should place you where these *new* stand, and burn your body to ashes. From my sight; begone! No; stay where you are. On second thoughts, I may need you.'

And with this odd ending to his speech, the young chief turned upon his heel, and came walking towards us.

The mulatto did not vouchsafe a reply, though his looks were full of vengeance. Once during the infliction, I thought I noticed him turn his eyes towards his ferocious followers, as if to invoke their interference.

But these knew that Oçeola was not alone. As

he came up, the trampling of a large troop had been heard; and it was evident that his warriors were in the woods not far distant. A single *Yo-ho-eh-ee*, in the well-known voice of their chief, would have brought them upon the ground before its echoes had died.

The yellow king seemed himself to be aware of their proximity; hence it was that he replied not. A word at that moment might have proved his last; and, with a sulky frown upon his face, he remained silent.

'Release them!' said Oçeola, addressing the *ci-devant* diggers; 'and be careful how you handle your spades. Randolph!' he continued, bending over me, 'I fear I have scarcely been in time. I was far off when I heard of this, and have ridden hard. You have been wounded; are you badly hurt?'

I attempted to express my gratitude, and assure him I was not much injured; but my voice was so weak and hoarse as to be hardly intelligible. It grew stronger, however, as those fair fingers administered the refreshing draught, and we were soon conversing freely.

Both of us were quickly 'unearthed;' and, with free limbs, stood once more upon open ground.

My first thoughts were to rush towards my sister, where, to my surprise, I was restrained by the chief.

'Patience!' said he; 'not yet—not yet. Maimee will go and assure her of your safety. See, she knows it already! Go, Maimee! Tell Miss Randolph, her brother is safe, and will come presently; but she must remain where she is—only for a little while. Go, sister, and cheer her.'

Turning to me, he added in a whisper:

'She has been placed yonder for a purpose; you shall see. Come with me; I shall shew you a spectacle that may astonish you. There is not a moment to be lost. I hear the signal from my spies. A minute more, and we are too late. Come—come!'

Without opposing a word, I hastened after the chief, who walked rapidly towards the nearest edge of the woods.

He entered the timber, but went no further. When fairly under cover of the thick foliage, he stopped, turned round, and stood facing towards the spot we had left.

Obedient to a sign, I imitated his example.

CHAPTER XCIV.

THE END OF ARENS RINGGOLD.

I had not the slightest idea of the chief's intention, or what was the nature of the spectacle I had been promised.

Somewhat impatient, I questioned him.

'A new way of winning a mistress,' said he with a smile.

'But who is the lover? who to be the mistress?'

'Patience, Randolph, and you shall see. Oh, it is a rare experiment, a most cunning farce, and would be laughable, were it not for the tragedy that accompanies it. You shall see. But for a faithful friend, I should not have known of it, and would not have been here to witness it. For my presence and your life, as it now appears—more still, perhaps—the honour of your sister—you are indebted to Haj-Ewa.'

'Noble woman!'

'Hie! they are near; I hear the tread of hoofs. One, two, three. Yes, it must be they; yes, yonder—see!'

I looked in the direction pointed out. A small party of horsemen, half-a-dozen in all, was seen emerging from the timber, and riding with a burst into the open ground. As soon as they were fairly uncovered, they spurred their horses to a gallop, and with loud yells, dashed rapidly into the midst of the camp. On reaching this point, they fired their pieces—apparently

into the air—and then continuing their shouts, rode on towards the opposite side.

I saw that they were white men. This surprised me; but what astonished me still more was that I knew them—at least I knew their faces, and recognised the men as some of the most worthless scamps of our own settlement. But a third surprise awaited me, on looking more narrowly at their leader. Him I knew well. Again it was Arens Ringgold!

I had not time to recover from this third surprise, when still a fourth was before me. The men of the camp—both negroes and Yamassees—appeared terrified at this puny attack, and scattering off, hid themselves in the bushes. They yelled loudly enough, and some fired their guns as they retreated, but like the attacking party, their shots appeared to be discharged into the air!

Mystery of mysteries! what could it mean?

I was about to inquire once more, when I observed that my companion was occupied with his own affairs, and evidently did not desire to be disturbed. I saw that he was looking to his rifle, as if examining the sights.

Glancing back into the glade, I perceived that Ringgold had advanced close to where my sister was seated, and was just halting in front of the group. I heard him address her by name, and pronounce some phrase of congratulation. He appeared about to dismount, with the design of approaching her on foot, while his men, still upon horseback, were galloping through the camp, huzzaing fiercely, and firing their pistols in the air.

'His hour is come,' muttered Oçeola, as he glided past me—a fate deserved and long delayed; it has come at last; and with these words, he stepped forth into the open ground.

I saw him raise his piece to the level with the muzzle pointed towards Ringgold, and the instant after, the report rang over the camp. The shrill *Ca-ha-queens* pealed from his lips as the planter's horse sprang forward with an empty saddle, and the rider himself was seen struggling upon the grass.

His followers uttered a terrified cry; and with fear and astonishment depicted in their looks, galloped back into the bushes—without even waiting to exchange a word with their wounded leader, or a shot with the man who had wounded him.

'My aim has not been true,' said Oçeola, with singular coolness; 'he still lives. I have received much wrong from him and his—ay, very much wrong—or I might spare his wretched life. But no; my vow must be kept; he must die!'

As he said this, he rushed after Ringgold, who had regained his feet, and was making towards the bushes, as if with a hope of escape.

A wild scream came from the terrified wretch as he saw the avenger at his heels. It was the last time that voice was ever heard.

In a few bounds, Oçeola was by his side—the long blade glittered for an instant in the air; and the downward blow was given so rapidly, that the stroke could scarcely be perceived.

The blow was instantaneously fatal. The knees of the wounded man suddenly bent beneath him, and he sank lifeless on the spot where he had been struck—his body after death remaining doubled up as it had fallen.

'The fourth and last of my enemies,' said Oçeola, as he returned to where I stood; 'the last of those who deserved my vengeance, and against whom I had vowed it.'

'Scott?' I inquired.

'He was the third: he was killed yesterday, and by this hand.'

'Hitherto,' he continued after a moment's silence, 'I have fought for revenge: I have had it. I have

slain many of your people. I have had full satisfaction; and henceforth'—

The speaker made a long pause.

'Henceforth?' I mechanically inquired.

'I care but little *how soon they kill me.*'

As Oçeola uttered these strange words, he sank down upon a prostrate trunk, covering his face with his hands. I saw that he did not expect a reply.

There was a sadness in his tone, as though some deep sorrow lay upon his heart, that could neither be controlled nor comforted. I had noticed it before; and, thinking he would rather be left to himself, I walked silently away.

A few moments after, I held my dear sister in my arms, while Jake was comforting Viola in his black embrace.

His old rival was no longer near. During the sham attack, he had imitated his followers, and disappeared from the field; but, though most of the latter soon returned, when sought for, the yellow king was not to be found in the camp.

His absence roused the suspicions of Oçeola, who was now once more in action. By a signal, his warriors were summoned, and came galloping up. Several were instantly despatched in search of the missing chief; but after a while, these came back without having found any traces of him.

One only seemed to have discovered a clue to his disappearance. The following of Ringgold consisted of only five men. The Indian had gone for some distance along the path by which they had retreated. Instead of five, there were *six* sets of horse-tracks upon their trail.

The report appeared to produce an unpleasant impression upon the mind of Oçeola. Fresh scouts were sent forth, with orders to bring back the mulatto, *living or dead.*

The stern command proved that there were strong doubts about the fealty of the yellow chief, and the warriors of Oçeola appeared to share the suspicions of their leader. The patriot party had suffered from defections of late. Some of the smaller clans, wearied of fighting, and wasted by a long season of famine, had followed the example of the tribe Omatla, and delivered themselves up at the fort. Though, in the battles hitherto fought, the Indians had generally been successful, they knew that their white foemen far outnumbered them, and that in the end the latter must triumph. The spirit of revenge, for wrongs long endured, had stimulated them at the first; but they had obtained full measure of vengeance, and were content. Love of country—attachment to their old homes—mere patriotism was now balanced against the dread of almost complete annihilation. The latter weighed heaviest in the scale.

The war-spirit was no longer in the ascendant. Perhaps, at this time, had overtures of peace been made, the Indians would have laid down their arms, and consented to the removal. Even Oçeola could scarcely have prevented their acceptance of the conditions; and it was doubtful whether he would have made the attempt. Gifted with genius, with full knowledge of the strength and character of his enemy, he must have foreseen the disasters that were yet to befall his followers and his nation. It could not be otherwise.

Was it a gloomy forecast of the future that imparted to him that melancholy air, now so observable both in his words and acts? Was it this, or was there a still deeper sorrow—the anguish of a hopeless passion—the drear heart longing for a love he might never hope to obtain?

To me, it was a moment of strong emotion, as the young chief approached the spot where my sister was seated. Even then was I the victim of unhappy suspicions; and with eager scrutiny, I scanned the countenances of both as they met.

Surely, I was wronging both. On neither could I detect a trace of aught that should give me uneasiness. The bearing of the chief was simply gallant and respectful. The looks of my sister were but the expressions of a fervent gratitude.

Oçeola spoke first:

'I have to ask your forgiveness, Miss Randolph, for the scene you have been forced to witness; but I could not permit this man to escape. Lady! he was your greatest enemy, as he has been ours. Through the co-operation of the mulatto, he had planned this ingenious deception, with the design of inducing you to become his wife; but failing in this, the mask would have been thrown off, and you—I need not give word to his foul intent. It is fortunate I arrived in time.'

'Brave Oçeola!' exclaimed Virginia, 'twice have you preserved the lives of my brother and myself—more than our lives. We have neither words nor power to thank you; I can offer only this poor token to prove my gratitude.'

As she said this, she advanced towards the chief, and handed him a folded parchment, which she had drawn from her bosom.

Oçeola at once recognised the document; it was the title-deeds of his patrimonial estate.

'Thanks, thanks!' he replied, while a sad smile played upon his lips. 'It is indeed an act of disinterested friendship. Alas! it has come too late. She who so much desired to possess this precious paper—who so much longed to return to that once loved home—is no more. My mother is dead. On yesternight, her spirit passed away.'

It was news even to Matimee, who, bursting into a wild paroxysm of grief, fell upon the neck of my sister. Their arms became entwined, and both wept—their tears mingling as they fell.

There was silence, broken only by the sobbing of the girls, and at intervals the voice of Virginia, murmuring words of consolation. Oçeola himself appeared too much affected to speak.

After a while, he aroused himself from his sorrowing attitude.

'Come, Randolph!' said he, 'we must not dwell on the past, while such a doubtful future is before us. You must go back to your home, and rebuild it. You have lost only a house; your rich lands still remain, and your negroes shall be restored to you. I have given orders—they are already on the way. This is no place for her,' and he nodded towards Virginia; 'you need not stay your departure another moment. Horses are ready. I myself shall conduct you to the borders, and beyond that, you have no longer an enemy to fear.'

As he pronounced the last words, he looked significantly towards the body of the planter, still lying near the edge of the woods. I understood his meaning, but made no reply.

'And she,' I said. 'The forest is a rude home—especially in such times—may she go with us?'

My words had reference to Matimee.

The chief grasped my hand, and held it with earnest pressure. With joy, I beheld gratitude sparkling in his eye.

'Thanks!' he exclaimed—'thanks for that friendly offer: it was the very favour I would have asked. You speak true; the trees must shelter her no more. Randolph! I can trust you—with her life—with her honour. Take her to your home!'

CHAPTER XXV.

THE DEATH-WARNING.

The sun was going down in the west, as we took our departure from the Indian camp. For myself, I had not the slightest idea of the direction in which we

should go; but with such a guide, there was no danger of losing the way.

We were far from the settlements of the Suwanee—a long day's journey—and we did not expect to reach home before another sun should set. That night there would be moonlight—if the clouds did not hinder it—and it was our intention to travel throughout the early part of the night, and then encamp. By this means, the journey of to-morrow would be shortened.

To our guide the country was well known, and every road that led through it.

For a long distance, the route conducted through open woods, and we could all ride abreast; but the path grew narrower, and we were compelled to go by twos, or in single file. Habitually the young chief and I kept in the advance—our sisters riding close behind us. Behind these came Jake and Viola; and in the rear, half-a-dozen Indian horsemen—the body-guard of Oçœla.

I wondered he had not brought with him more of his followers, and even expressed my surprise. He made light of the danger. The soldiers, he said, knew better than to be out after night; and for that part of the country, through which we were to travel by daylight, no troops ever strayed into it. Besides, there had been no scouting of late; the weather was too hot for such work. If we met any party, they would be of his own people. From these, of course, we had nothing to fear. Since the war began, he had often travelled most of the same route alone. He appeared satisfied that there was no danger.

For my part, I was not. I knew that the path we were following must take us within a few miles of Fort King. I remembered the escape of Ringgold's crew. They were likely enough to have ridden straight to the fort, and communicated an account of the planter's death, garnished by a tale of their own brave attack upon the Indians. Among the authorities, Ringgold was no common man. A party might be organised to proceed to the camp. We were on the very road to meet them.

Another circumstance I thought of—the mysterious disappearance of the mulatto, as was supposed, in company with these men. It was enough to create suspicion. I expressed it to the chief.

'No fear,' said he, in reply; 'my trackers will be after them; they will bring me word in time. But no,' he added, hesitating, and for a moment appearing thoughtful; 'they may not get up with them before the night falls, and then— You speak true, Randolph. I have acted imprudently. I should not care for those foolish fellows; but the mulatto—that is different: he knows all the paths; and if it should be that he is turning traitor—if it— Well, we are astart now, and we must go on. You can have nothing to fear; and as for me, Oçœla never yet turned his back—and will not now—upon danger. Nay, will you believe me, Randolph, I rather seek it than otherwise?'

'Seek danger?'

'Ay—death, death!'

'Speak low: do not let them hear you say so.'

'Ah, yes!' he added, lowering his tone, and speaking in a half soliloquy; 'in truth, I long for its coming.'

The words were spoken with an emphasis that left no room to doubt of their earnestness.

Some deep melancholy had settled upon his spirit, and was preying upon it continually. What could be its cause?

I could remain silent no longer. Friendship, not curiosity, incited me. I vouchsafed the inquiry.

'You have observed it then? But not since we set out—not since you made that friendly offer? Ah, Randolph! you have rendered me happy. It

was she alone that made the prospect of death so gloomy.'

'Why speak you of death?'

'Because it is near.'

'Not to you?'

'Yes, to me. The presentiment is upon me that I have not long to live.'

'Nonsense, Powell.'

'Friend, it is true—I have my death-warning.'

'Come, Oçœla! this is unlike you. Surely you are above such vulgar fancies? I will not believe you can entertain them.'

'Think you I speak of supernatural signs? of the screech of the qua-bird, or the hooting of the midnight owl—of omens in the air, the earth, or the water? No, no; I am above such shallow superstitions. For all that, I know I must soon die. It was wrong of me to call my death-warning a presentiment—it is a physical fact that announces my approaching end—it is *here*.'

As he said this, he raised his hand, with a gesture as if to indicate the chest. I understood his melancholy meaning.

'I would rather,' he continued after a pause—'rather it had been my fate to fall upon the field of battle. True, death is not alluring in any shape, but that appears to me most preferable. I would choose it rather than linger on; nay, I have chosen it. Ten times have I thus challenged death—gone half-way to meet it—but, like a coward or a coy bride, it refuses to meet me.'

There was something almost unearthly in the laugh that accompanied these last words—a strange smile—a strange man.

I could scarcely make an effort to cheer him. In fact, he needed no cheering: he seemed happier than before. Had it not been so, my poor speech, assuring him of his robust looks, would have been words thrown away. He knew they were but the false utterance of friendship.

I had even suspected it myself. I had noticed the pallid skin—the attenuated fingers—the glassed and sunken eye. This, then, was the canker that was prostrating that noble spirit. I had assigned a far different cause.

The future fate of his sister had been the heaviest load upon his heart. He told me so as we went onward.

I need not repeat the promises I then made to him. It was not necessary they should be vows: my own happiness would hinder me from breaking them.

CHAPTER XXVI.

OÇŒLA'S FATE—CONCLUSION.

We were seated near the edge of the little opening where we had encamped—a pretty parterre, fragrant with the perfume of a thousand flowers. The moon was shedding down a flood of silvery light, and objects around us appeared almost as distinctly as by day. The leaves of the tall palms, the waxen flowers of the magnolias, the yellow blossoms of the zanthoxylon trees, could all be distinguished in the clear moonbeams.

The four of us were seated together—brothers and sisters—conversing freely as in the olden time; and the scene vividly recalled the past to us all.

But memory now produced only sad reflections, as it suggested thoughts of the future. Perhaps we four should never meet again. Gazing upon the doomed form before me, I had no heart for reminiscences of joy.

We had passed Fort King in safety—had encountered no white face—strange I should fear to meet men of my own race—and no longer had we any apprehension of danger, either from ambush or open

attack. The Indian guard, with black Jake in their midst, were near the centre of the glade, grouped by the fire, and cooking their suppers. So secure did the chieftain feel, that he had not even placed a sentinel on the path. He appeared indifferent to danger.

The night was waning late, and we were about returning to the tents—which the men had pitched for us—when a singular noise reached us from the woods! To my ears, it sounded like the surging of water, as of heavy rain or the 'sough' of distant rapids.

Oçeola interpreted it otherwise. It was the continuous 'whisking' of leaves caused by a numerous band passing through the bushes, either of men or animals.

We instantly rose to our feet, and stood listening.

The noise continued; but now we could hear the snapping of dead branches, and the metallic clinking of weapons.

It was too late to retreat. The noise came from every side. A circle of armed men was closing around the glade.

I looked towards Oçeola. I expected to see him rush to his rifle that lay near. To my surprise, he did not stir.

His few followers were already on the alert, and had hastened to his side to receive his orders. Their words and gestures declared their determination to die in his defence.

In reply to their hurried speeches, the chieftain made a sign that appeared to astonish them. The butts of their guns suddenly dropped to the ground, and the warriors stood in listless attitudes, as if they had given up the intention of using them!

'It is too late,' said Oçeola, in a calm voice—'too late! We are completely surrounded. Innocent blood might be spilled; and mine is the only life they are in search of. Let them come on; they are welcome to it now. Farewell, sister! Randolph, farewell! Farewell, Virg'—

The plaintive screams of Maïmee—of Virginia—my own bursting, and no longer silent grief, drowned the voice that was uttering those wild adieus.

Clustering close to the chief, we knew not what was passing around us. Our whole attention was fixed upon him, until the shouts of men, and the loud words of command proceeding from their officers, warned us that we were in the midst of a battalion of soldiers. On looking up, we saw that we were hemmed in by a circle of men in blue uniforms, whose glancing bayonets formed a *chevaux de frise* around us.

As no resistance was offered, not a shot had been fired; and save the shouting of men and the ringing of steel, no other sounds were heard.

Shots were fired afterwards, but not to kill. It was a *feu-de-joie* to celebrate the success of this important capture.

The capture was soon complete. Oçeola, held by two men, stood in the midst of his pale-faced foes—a prisoner.

His followers were also secured; and the soldiers fell back into a more extended line—enclosing the captives in their midst.

At this moment a man appeared in front of the ranks, and near to where the prisoners were standing. He was in conversation with the officer who commanded. His dress bespoke him an Indian; but his yellow face contradicted the supposition. His head was turbaned, and three black plumes drooped over his brow. There was no mistaking the man.

The sight was maddening. It restored all his fierce energy to the Seminole chief; and, flinging aside the soldiers as if they had been children, he sprang forth from their grasp, and bounded towards the yellow man.

Fortunate for the latter, Oçeola was unarmed. He had no weapon left him—neither pistol nor knife; and, while wringing his bayonet from the gun of a soldier, the traitor found time to escape.

The chief uttered a groan, as he saw the miscreant pass through the serried line, and stand secure beyond the reach of his vengeance.

It was but a fancied security on the part of the renegade. His death had been decreed, though it reached him from an unexpected quarter.

As he stood outside, and facing toward the captives, a dark form was seen gliding up from behind. It was that of a woman—a majestic woman—whose grand beauty was visible even in the moonlight, though no one saw either her or her beauty. The prisoners alone were fronting towards her, and observed her approach.

It was a scene of only a few seconds' duration. The woman stole close up to the mulatto, and for a moment her arms appeared entwined around his neck.

There was the sheen of some object that in the moonlight gleamed like metal. It was a living weapon—it was the dread *crotalus*.

The rattle could be heard distinctly; and close following rose a wild cry of terror as its victim felt the cold contact of the reptile around his neck, and its sharp fangs entering his flesh.

The woman was seen suddenly to withdraw the serpent; and holding its glistening body over her head, she cried aloud:

'Grieve not, Oçeola—thou art avenged! avenged! the chittamico has avenged you.'

Saying this, the woman glided rapidly away; and before the astonished listeners could cut off her retreat, she had entered among the bushes, and disappeared.

The horror-struck mulatto staggered over the ground, pale and terrified, his eyes almost starting from their sockets. Men gathered around, and endeavoured to administer remedies. Gunpowder and tobacco were tried; but no one knew the simples that would cure him.

It proved his death-wound; and before another sun went down, he had ceased to live.

With Oçeola's capture the war did not cease—though I bore no further part in it—neither did it end with his death, which followed a few weeks after. Not by court-martial execution did he die—for he was no rebel, and could claim the privilege of a prisoner of war—but of that disease which he knew had long doomed him. Captivity may have hastened the event. His proud spirit sank under confinement, and with it the noble frame in which it was enshrined.

Friends and enemies stood around him in his last hour, and listened to his dying words. Both alike wept. In that chamber of death, there was not a tearless cheek; and many a soldier's eye was moist as he listened to the muffled drum that made music over the grave of the noble Oçeola.

After all, it proved to be the jovial captain who had won the heart of my capricious sister. It was long before I discovered their secret, which let light in upon a maze of mysteries; and I was so spited about their having concealed it from me, that I almost refused to share the plantation with them.

When I did so, at length—under threat of Virginia—not her solicitor—I kept what I considered the better half for myself and Maïmee.

The old homestead remained ours, and a new home soon appeared upon it—a fitting casket for the jewel it was destined to contain.

I had still an out-plantation to spare—the fine old Spanish clearing on the Tupelo creek. I wanted a

man to manage it, or rather a 'man and wife of good character, without incumbrances.'

And for this purpose, who could have been better than Black Jake and Viola—since they completely answered the above conditions?

I had another freehold at my disposal—a very small one. It was situated by the edge of the swamp, and consisted of a log-cabin, with the most circumscribed of all 'clearings' around it. But this was already in possession of a tenant whom—although he paid me no rent—I would not have ejected for the world. He was an old alligator-hunter of the name of Hickman.

Another of like 'kidney'—Weatherford by name—lived near on an adjoining plantation; but the two were oftener together than apart.

Both had suffered a good deal of rough handling in their time—from the claws of 'bars,' the jaws and tails of alligators, and the tomahawks of Indians. When together, or among friends, they delighted to narrate their hairbreadth escapes; and both were often heard to declare that the 'toughest scrape they ever kumm'd clar out o' war a burnin' forest o' dog-goned broom-pines, an' about ten thousand red Indjuns aroun' them.'

They did come clear out of this scrape, however, and lived long after to tell the tale with many a fanciful exaggeration.

END OF OCEOLA.

THE MONTH:

SCIENCE AND ARTS.

THE sessions of the learned and scientific societies are over; philosophers and savans, in common with under-graduates, are dispersing for 'the long;' and, except at the British Association meeting at Leeds in September next, science will not have much to say for herself before next November. The Fellows of the Royal Society have something to occupy their thoughts with during the vacation—namely, a new president. Lord Wrottesley, the actual president—a well-known astronomer, and excellent man of business—has announced his intention to resign the chair at the Society's anniversary, next St Andrew's Day. This announcement has been made the occasion of appeals to the Fellows—in some instances, more wordy than wise—to lay aside flunkeyism, tuft-hunting, and so forth, and to ask why Mr Faraday should not be chosen. As it happens, Mr Faraday was asked to allow himself to be put in nomination; but, as those who know him best anticipated, he declined the honour. Sir Benjamin Brodie was next applied to; he has given his consent; and there is every reason to believe that he will be elected president when the time comes. The right course for the Royal Society, as well as for other people, is to do that which is best and wisest, without regard to what the world may think thereof.

Of things exhibited at the soirées of certain scientific societies, some are well worthy of remark, as, for example, the large collection of water-colour landscapes painted by Mr Atkinson during his long travel in *Oriental and Western Siberia*. To most persons, the vast country in question is but a name, a patch on a map; but these views present it to the eye with its extraordinary characteristics of river, rock and mountain, and sky of marvellous splendour. And in that remote land, Russia is now developing her resources to the utmost, even to the borders of India and China. Other things which surprised all who saw them, were the products of Burmese naphtha, or Rangoon tar, as it is called commercially. Some account of this tar was communicated to the Royal Society, last year, by Mr Warren de la Rue, shewing

it to be rich in materials for the chemist; and since then, by diligent researches, most satisfactory results have been obtained. As Mr Barlow explained, in a lecture at the Royal Institution, the practical results have been worked out in the laboratory at Price's celebrated candle-factory at Vauxhall; and what these are was shewn by the specimens exhibited. Out of that black tar, the chemist extracts *Belmontine*, a beautiful wax-like substance, of which candles are made so brilliant and transparent that wax appears dull in comparison. Three qualities of oil are also obtained; one resembling gin in appearance when seen in a flask, burning with a brilliant flame, and ignitable only with a wick—hence no danger of explosion; and two, brown in colour, useful for machinery and spindles, and with the advantage that they produce none of the corrosive effects on metal produced by other oils, for they are not decomposable into an acid. Then there is a detergent fluid that removes spots without staining even delicate coloured silks, to which the name of *Sherwoodole* is given; and we have seen small specimens of a splendid crimson powder got out of the wonderful tar, which, it is thought, will be much prized by dyers. And the researches are still going on, for the products are not yet all discovered. Hence we have a new import, and a new resource for industry. The Burmese dig holes in the ground near the Irawaddy, and the tar flows slowly in from the surrounding soil, and, as it accumulates, is ladled into iron tanks, and hermetically closed, to prevent the escape of the volatile matters.

A paper, by Mr Fairbairn, read before the Royal Society, contains, under the title 'On the Resistance of Tubes to Collapse,' some most important experimental results, and practical applications, which may be briefly summed up as follows: The construction of steam-boilers has not kept pace with the increased pressure to which they are now subjected. Formerly, the pressure was from ten pounds to fifteen pounds to the square inch; now, it is 150 pounds. Hence frequent explosions, with, at times, disastrous consequences. The outer shell of boilers is commonly made three or four times as strong as the internal flues, whereby the flues collapse, explode, and blow the outer shell to pieces.

The remedy is, to make of equal strength all parts of an engine or boiler acted on by the steam, so that the resistance shall be uniform.—To take care that the flues shall be perfectly cylindrical, that being the form which resists best.—To remember that the longer a flue or tube is, the less can it be depended on for strength. A tube thirty feet long is weak in comparison with one of ten feet. Hence short tubes or flues are to be preferred; but long ones may be strengthened by fitting on them rigid hoops at regular intervals, the effect of which is to render the space between any two hoops as strong as if the tube were of that length only. Another precaution is, to put the flues together, not with lap-joints, as is the usual way, but with butt-joints, covered by a ring through which the rivets are passed. Where lap-joints are used, angle-irons should be introduced to give strength.

Although these results and improved methods will be best appreciated by engineers and practical mechanics, they are important to the public at large, seeing how dependent we are on steam-boilers for travelling. If Mr Fairbairn lessens the risks of travelling, the community will have to thank him for highly meritorious service. For our part, we gladly assist, by this brief summary, in making his improvements known.

Experimental researches are assiduously kept up by the authorities at Woolwich: among the latest are those on the flight of projectiles, with a view to combine the utmost accuracy of aim with the greatest

economy of powder; and others with superheated steam in navigation which give satisfactory results, for it heightens power, accelerates speed, and lessens the consumption of coal. And something has been done in a matter which many will consider as the most important of all—namely, improved cooking for soldiers. A stove apparatus, invented by Captain Grant, bakes, boils, and stews all at once, with a saving of four-fifths of the coal required by the old method, and without stifling the kitchen by clouds of steam and disagreeable fumes. It was found that three meals for 1050 men could be cooked with 500 pounds of coal, and that there is no loss, but equal economy in cooking for a smaller number.—At Portsmouth, trials have been made of a chain portcullis, constructed after the manner of the chain-armour of the olden time, to see whether it could be depended on to keep besiegers outside of town-gates. It is made of three-eighth chain, properly linked together, and will resist the explosion of bags of powder, but gives way before cannon-balls. A notion prevails that in some circumstances the contrivance will be eminently useful—in baffling an assault, for example.

A report, favourable to the undertaking, has been received at the Admiralty from Captain Pullen, who was sent out in the *Cyclops* to sound in the Red Sea for a track for a telegraph cable. A telegraph to India is much wanted; and while the experts are debating on the merits of the Euphrates Valley or the Red Sea routes, the people are wondering why the telegraph was not laid months ago. Some imagine the delay to be owing to secret political reasons.—There is talk of a new telegraph to America, connecting England and the continent, from Hull to Cuxhaven; thence by lines already established to the Mediterranean; thence to the Azores; and so across the Atlantic. It is proposed to use sounds instead of signs, and experiments are making with different-toned bells to communicate messages.—The Portuguese government are about to establish a monthly line of steamers to trade from Lisbon to the Azores, and the west coast of Africa; and here we are led to remark, that while even minor European states carry on ocean steam-navigation successfully, the United States lines either fail or are worked at a loss. Clearly the race is not always to the swift. After all, canvas is not to be despised, seeing that the *Red Jacket* sailed from Melbourne to Liverpool in sixty-three days on her last voyage.—Sir John Pakington, with an anticipatory liberality unusual in a lord of the Admiralty, has made known to the Royal and Astronomical Societies, that a free passage will be granted on board one of Her Majesty's ships, to any English astronomer, who, being at Rio de Janeiro in September next, may wish to observe the total eclipse of the sun then to take place, from St Paul's or St Catherine's on the coast of Brazil; and that instructions will be given to the commander to render all needful assistance in setting up the instruments, and the work of observation.

Sir Charles Lyell's recent explorations of Teneriffe, Etna, and Vesuvius, have borne fruit in the shape of a paper to the Royal Society on lavas, and certain volcanic phenomena therewith connected. The subject is one in which geologists are deeply interested. Another geological matter is, the discovery of a cave in the limestone near Brixham, in Devonshire. Labourers, while digging the foundation for a cottage, broke into a cavity in the side of a hill, which, on examination, was found to lead into a cave, where, besides stalactite and stalagmite, the bones of numerous animals were discovered. Precautions have been taken to preserve the cavern from pillage, until it can be properly explored by competent geologists, a task that will not be long delayed, for the Royal Society have voted £100 from their Donation Fund

towards the cost, and the Geological Society are going to accomplish the work. It is thought that the exploration will throw new light on some of the great questions of geology. The limestone of Devonshire is rich in fossils; and Kent's Hole, near Torquay, is a well-known specimen of its caverns.—Professor Ramsay has made the geological characteristics of Canada the subject of a paper for the Geological Society, and a lecture at the Royal Institution. We mention it because it seems to define the time at which one of the great geological periods—the drift-period—closed. The great escarpment seen at Queenston and Lewiston was once a coast-line washed by the sea. This sea deposited a clay, known locally as the Leda clay; and while this deposit was going on, the falls of Niagara began to plunge over the escarpment. The falls have worn a deep gorge back through the rock for seven miles to their present site, at the rate of a mile, as geologists calculate, in 5000 years. Hence 85,000 years have elapsed since the close of the drift-period. If this calculation can be verified, 'an important step will be gained,' as Professor Ramsay observes, 'towards the actual estimate of a portion of geological time.'

There is something interesting to be said concerning physiological subjects. M. Brown-Séquard, one of the most distinguished of living physiologists, is lecturing at St Bartholomew's Hospital, and at the College of Surgeons. He is well known for laborious researches on the phenomena of the nervous system, in which he has made remarkable discoveries, especially as to the effect of incisions. In one of his lectures, he exhibited guinea-pigs which had been experimented on some months ago by cutting certain nerves; the hinder limbs became paralysed, but in time the animals recovered the power of voluntary motion, attended, however, with a very curious result—the operator could put them into a fit of epilepsy whenever he pleased. It appears that by the cutting of the nerves, the animals lose sensation except in one cheek, and if that spot be irritated, a fit is the immediate consequence. Another noticeable particular is, that the lice which infest the animals congregate on that spot, and nowhere else. Whether it be that there is more warmth, or more perspiration than on other parts of the body, is not known; at anyrate, physiologists are agreed as to the singular and suggestive nature of the phenomenon. It appears, moreover, that if the sensibility of the sensitive spot be destroyed, then the guinea-pig ceases to be liable to epilepsy. Applying this fact to human physiology, M. Brown-Séquard says that there is in the human body a spot, discoverable, as he believes, by galvanism, which, if deprived of its sensibility, would in like manner completely prevent attacks of epilepsy. These are important facts, which, while they lead to the hope that a distressing disease may be abated or altogether removed from the list of diseases, teach us that we have yet very much to learn concerning the economy of the nervous system. If M. Brown-Séquard's conclusions can be successfully worked out and applied, he will deserve a monument not less than Jenner, to whom tardy justice has at length been done by a commemorative statue among the warriors in Trafalgar Square.

We cannot forbear calling attention here to the registrar-general's last quarterly report, as it contains matters in which we are all concerned. He tells us that the number of marriages in 1857, particularly in the last quarter, was below the average. He states the total number for the year as 159,392. The births were 662,884, and the deaths 420,019. In the first quarter of the present year, the births amounted to 171,001, a greater number than any registered in any corresponding quarter. It is as if nature were zealous to make up the loss occasioned by war, when she

sends children into the world here in England at the rate of 1900 a day. Allowing for deaths, there was an actual increase of 501 daily. At the same time there has been a remarkable falling-off in emigration from the United Kingdom since the Russian war. In the first three months of 1849, the number of emigrants was 60,626: in the first three months of 1858, only 19,146.

In discussing the deaths in the first quarter of this year, numbering 125,902, the registrar tells us that out of these there were 488 every day which may properly be called 'unnatural deaths.' This is a startling conclusion; but the winter was cold, and whenever the temperature falls below forty, the death-barometer rises rapidly; and diseases of the respiratory organs become fatally prevalent. Besides, our attention is called to *diphtheria*, a new form of throat-disease, malignant in character. It is sometimes called the 'Boulogne disease,' because of so many English having suffered from it in that town; and at a time, too, when the French authorities declared it to be unusually healthy. For this disease it appears we are especially indebted to the noxious exhalations from cess-pools, sewers, gully-holes, and the like. Dr Barker has made a number of curious experiments on dogs and birds by confining them in a chamber into which air can be introduced direct from a cess-pool at pleasure. In every case the effect was hurtful, and would have been fatal if continued long enough. This, on a small scale, is but an example of what is going on in towns and cities, villages and country mansions continually—day and night. 'A variation in the pressure of the atmosphere draws up the stinking air from the sewers, like Dr Barker's bellows.'

Who is there will not unite with the registrar, where he says: 'It is now time that this cruel experiment should cease. Last year, when no epidemic prevailed, not less than 14,795 unnatural deaths were registered in London. This was the aggregate effect of the impure air, and of other sanitary defects. . . . The sweet odours that enter the country are taxed; and every one has witnessed the admirable zeal of Her Majesty's customs' officers in their searches for *Eau de Cologne*. If a tax could be levied upon odours of another description, bearing some proportion to the evil they do, it would be much more productive; and if it were levied through the agency of the Boards of Works in London, and the Sewers Commission elsewhere, it might be more beneficial, as they would undoubtedly find it economical to substitute fountains of rose-water for their present gully-holes.'

Among the lectures delivered before the United Service Institution—on subjects important to the army and navy—is one by Dr Guy—'On the Sanitary Condition of the British Army, and especially on the Want of Space in Barracks.' That the mortality of our soldiers, especially of the foot-guards, should be greater than that of the civil population, he calls 'a distressing and disgraceful fact.' Chief among the causes of this mortality is overcrowding, whereby the men breathe over and over again air fouler than a horse-pond. If it could only be rendered visible, they would mutiny forthwith every man—and why not? Another cause is want of work. Idleness is fatal to longevity, as proved by returns concerning classes who are not soldiers. At the age of thirty, an agricultural labourer may expect to live forty-one and a half years longer; a nobleman, the lord of parks and broad acres, only thirty-one years. The labourer is commonly badly lodged, and poorly fed; but he works, and works every day; the nobleman rarely does anything that can be dignified with the name of work—hence he dies of ennui and self-indulgence. Dr Guy makes a list which commences with

the agricultural labourer; sailors come next; then policemen; the fire brigade; aristocrats; tailors, compositors, and clerks; draymen and licensed victuallers; and last, soldiers. It will surprise many readers to find the labourer at the head of the list, the aristocracy half-way down, and infantry at the foot. Let soldiers have more varied exercise than that of drill—let them have more air, let them do farm-work whenever possible, and play at cricket and quoits every day.

Dr Guy feels deeply on the subject, and in closing his lecture, called attention to the achievements at Balaklava, to the 'soldiers' victory' at Inkermann; to the heroic discipline on board the sinking *Birkenhead*, and the rescue of the *Sarah Sands*. 'I have said,' he said, 'the first instalment of my debt of gratitude to the noblest and bravest army that ever rallied round the standards of a careless, indifferent, and too often ungrateful nation.'

ALL FOR A PENNY.

Among the evils which were predicted by the opponents of the 'cheap press' was this, that each inconsiderable trade would have its own weekly organ, and every parish its particular penny trumpet; but although we must accept the fact, there is no necessity to accept it as an evil. A local journal which now lies before us, modestly entitled the *Tottenham and Edmonton Advertiser*, is a proof of this; it is a monthly periodical consisting of some ten broad pages, about four of which are devoted to advertisements, and one to the times of arrival and departure of the metropolitan trains; the rest is taken up with the ordinary intelligence of a local paper, with some interesting and unusual matter in addition. This last consists of a careful meteorological report of the district; of a catalogue of all the wild-flowers which grow in the neighbourhood, with an accurate description of their whereabouts, such as might have been written by some botanical White of Selborne; of an account of the insects which make their appearance in each month respectively; of a monthly almanac adapted to local circumstances, with meetings of the choral society of Tottenham instead of European battles, and with sittings of the bench of magistrates instead of red-letter saints; and especially of antiquarian or archaeological investigations, such as may give an interest to the locality.

It seems to us that this is not only a very liberal carte, but just the fare which a local journal should endeavour to provide for its readers. Nor should we omit to mention that in addition to all this pleasant intelligence there are not wanting the graces of the muse, and the lively efforts of fancy. The bard of the *Tottenham and Edmonton Advertiser*, to use the words of a great critic, 'treads in the shadow' of Longfellow himself, and indeed parodies him, in the following description of two dignitaries of the parish:

On a seat beside the highway,
With their pipes and their tobacco,
In the fading light of evening,
With their faces looking westward:
Gazing, as the sun descended
O'er the purple hills of Muswell;
Watching all the darkening shadows,
As they lengthened, lengthened, lengthened;
With their faces flushed and reddened,
In the glory of the sunset—
As a maiden's cheeks are crimsoned
When she first beholds our author;
When she feels her heart departing,
Passing into his possession—
Sat the Beadle of our parish,
And beside him, in his glazed hat,
With his blue coat and his choker,

With his white gloves and his truncheon,
Sat a 'Bobby,' a Policeman:
Each recounting his adventures,
Telling of his deeds of valour;
Telling of his might and prowess,
Boasting of his might and prowess.

While, under the head of 'The Board of Health and the Civil Service Examination Commission,' the following examples are given of the probable ordeal the local authorities will have to undergo—as being especially suitable for them—before Her Majesty's Commissioners.

THE BOARD OF HEALTH AND THE CIVIL SERVICE
EXAMINATION COMMISSION.

It is rumoured that the new members of the above Board will have to undergo an examination by Her Majesty's Commissioners, and the following, we are credibly informed, are some of the questions which they will have to answer:

Latin.—Define accurately the difference between meum and tuum. Explain the relation between propria quæ maribus and ceteris paribus.

Mathematics.—How many churchwardens go to a beadle? (As this is an important local question, the sum must be worked out to fourteen places of decimals.)

History.—Mention the two instances in the last 600 years when the parish engine had arrived before the fire was extinguished.

Geography.—Point out the precise spot in Carbonele Ditch where boys find good sport in fishing. (For fact, see Medical Officer's Report, published in February 1857.)

Grammar.—Put into grammatical English the last month's minutes of the Local Board.

Literature.—Enumerate the first-rate authors who contribute to the *Tottenham and Edmonton Advertiser*.

Moral Qualifications.—How often can you eat your own words without feeling any bad effect?

Sanitary.—How much soft sawder would you recommend the Board to administer to the parish annually?

If this be not very good or very witty, it is, at least, better and wittier than what passed for information and fancy in newspapers affecting to be universal not many years ago: and we hail it as a proof that the Penny Press, even when solely local, can be made of value, and are glad to see that similar papers of equal cheapness are growing up elsewhere.

MAY MORNING.

Up and away! 'tis jocund May;
The lark already is singing,
In every bush spring glories flush,
And the fresh green corn is springing.

Waste not the hours when early flowers
Their sweetest scents exhale,
When the budding thorn salutes the morn,
And fragrance floats on the gale.

Oh, the matin prime is the loveliest time
Of this lovely month of May,
And to gather its dews will joy diffuse
Throughout the live-long day.

The sun is come, and the insects hum,
With joy the air is filling;
With mellow note the black-bird's throat
In ecstasy is thrilling.

The arums peep from their long, long sleep,
And their lordly stems uprear;
Kingcups unfold their stars of gold,
Pale cowslip buds appear.

With silver tide the streamlets glide,
And as they wander by,
The forget-me-not, with its bright blue spot,
Opens its laughing eye.

The wind-flower nods to the silvan gods,
The sweet blue-bells are ringing
Their faery chime to the matin prime,
And the violets are incense flinging.

Then let our hearts take up their parts,
And join the grateful choir,
In echoes long repeat the song;
Such strains can never tire.

Ah! the morn of May is a holiday
Not only to birds and flowers,
It gladness brings on its joyous wings
To these human hearts of ours.

For children greet, with offerings meet,
The year's most favoured child,
With pastimes gay, and roundelay,
And garlands richly piled.

And on the green they choose their Queen,
The happy Queen of the May;
In a merry ring they dance and sing,
And who so blithe as they?

And the sooty hosts—so London boasts—
This day allowed to rest,
Are called to share their master's fare,
Nor dread his stern behest.

Oh, human flowers! these happy hours
Of sunshine and of joy,
Their fruit shall bear, though toil and care
In future years annoy.

For the thoughts of bliss that the heart may miss
When life grows sad and drear,
Yet shed a light which still glows bright
Through the tints of autumn here.

Then up and away! to greet fair May,
With smiles the earth adorning;
Cull life's best flowers, and let well-spent hours
Shed joy like a sweet May morning.

B. K. R.

The present number of the Journal completes the Ninth Volume, for which a title-page and index have been prepared, and may be had of the publishers and their agents.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 235.

SATURDAY, JULY 3, 1858.

PRICE 1½d.

SHOWS AND SHOWMEN.

The remarkable history given by Mr Barnum, in his renowned autobiography, of the various enterprises he had successfully conducted as a showman, and his exposure of the numerous intrigues, manoeuvres, and hidden machinery by which he had worked 'the oracle,' would, it was thought by many, be a complete death-blow to the exhibition interest. Such, however, has not proved to be the case. Public curiosity is as rampant as ever; and great and little shows continue to pass and repass the same as if the great showman had never laid bare the secrets of the prison-house; indeed, we should say they have rather increased since that time; and even Tom Thumb, one of Mr Barnum's greatest cards in the way of showmanship, is again on the road, notwithstanding all that has been exposed in the autobiography.

The exhibition-world, and what it contains, and the singular people who are in most instances connected with it, have ever been a pleasant source of wonder, especially to the gullible portion of the public; and a really good show is one of those things which is certain to yield any number of fortunes. It is no matter what it is; it may consist of but one thing, or it may be a museum, containing a thousand articles; it may be either Tom Thumb, or Wombwell's united collections of wild animals, the original learned pig, or Richardson's dramatic booth—only let it get properly afloat, under the charge of an enterprising manager, and it becomes straightway a magnet drawing to itself the superfluous cash of the country for miles around. Has any person ever calculated the enormous amount of money annually expended on shows? Were the receipts of all our exhibitions, stationary as well as itinerant, added together, and the amount shewn, it would appear fabulous. Without including an occasional show like the World's Fair of 1851, but taking into account all established places of amusement, from such high-class shows as Her Majesty's Theatre, down to the humblest exhibition at a country-fair, we could easily shew, startling as it may seem, that the annual amount expended on our various shows and exhibitions is greater than that expended on books and periodicals. Mr Richardson, the proprietor of the well-known dramatic booth, or 'Richardson's Show,' as it was called, died, we are assured, worth £50,000; and the late Mr Wombwell, the proprietor of the extensive menagerie, was equally wealthy. Many other showmen have likewise accumulated fortunes, and left sums of money at their death greater than those accumulated in the publishing trade.

VOL. X.

The gullibility of the public, and the love of the marvellous, calls into action the inventive genius of a class of people who are ever ready to turn the public craving into a means of making money; and, in addition to what we can make up at home, every portion of the globe is ransacked in turn to find novelties for the showman: the hippopotamus is caught, and hurried away from his African haunts to the Regent's Park; the united twins are taken from one of the distant slave-states of America, and conveyed to Europe for the same purpose; and we have good reason to suppose that an enthusiastic showman has started off to St Helena, in order to secure, if possible, the great sea-serpent that has been seen so frequently of late disporting itself off that island. When a showman has secured something with a look of novelty, the next great point is to dress up a good story, by which to recommend it to public notice, or, as the showmen say, get out 'a stunning gag.' Nothing is so attractive as a marvellous legend of some kind or other; in fact, everything connected with a show should smack of romance. Barnum was completely master of this art, and the history of how he 'worked' the Feejee mermaid may be taken as a type of the quality of good showmanship, as devoted to this particular branch of the business.

The Feejee mermaid was one of Mr Barnum's most successful American speculations. This young lady was heralded to the public of New York by glowing descriptions and flattering criticisms, in the leading papers of that city; and the ingenious exhibitor contrived numerous plans to increase the interest the press had created, and keep up at its full height what he designated 'the mermaid fever.' Wood-cuts and transparent views were got up, portraying the mermaid at full length; and a pamphlet was issued under Mr Barnum's auspices, detailing her history, and proving her authenticity. Editors and reporters were favoured with 'private inspections,' and went away honestly persuaded that what they had seen was a veritable mermaid. In fact, it was almost impossible to detect the hand of the *manufacturer* in the composition. This was a combination of the upper half of a monkey, with the lower part of a fish; and the monkey and the fish were so ingeniously conjoined, that nobody could discover the point at which the junction was formed. 'The spine of the fish proceeded in a straight and apparently unbroken line to the base of the skull—the hair of the monkey was found growing down several inches on the shoulders of the fish—and the application of a microscope actually revealed what seemed to be minute fish-

scales lying in myriads amongst the hair. The teeth, and formation of the fingers and hands, differed materially from those of any monkey or orang-outang ever discovered, while the location of the fins was different from those of any species of the fish-tribe known to naturalists. The mermaid was an ugly, dried up, black-looking, and diminutive specimen, about three feet long. Its mouth was open, its tail turned over, and its arms thrown up, as if it had died in the greatest agony.' The person from whom Mr Barnum bought it informed him that it had been obtained from some Japanese seamen, by a sailor in Calcutta; and not doubting that it would prove a valuable speculation, Mr Barnum became its proprietor and exhibitor; with what success may be inferred from the fact, that 'the receipts of the American Museum for the four weeks immediately preceding the exhibition of the mermaid, amounted to 1272 dollars; while, during the first four weeks of the mermaid's exhibition, they amounted to 3341 dollars 93 cents.'

For the success which attended the speculation, however, Mr Barnum was indebted in a great measure to the notices in the New York papers, and the rumours regarding the history of the Feejee mermaid, which he caused to be industriously circulated. On this point, he says in his autobiography: 'I called respectively on the editors of the *New York Herald*, and two of the Sunday papers, and tendered to each the free use of a mermaid cut, with a well-written description, for their papers of the ensuing Sunday. The three mermaids made their appearance in the three different papers on the morning of Sunday, July 17, 1842. Each editor supposed he was giving his readers an exclusive treat in the mermaid line; but when they came to discover that I had played the same game with the three different papers, they pronounced it a *scalpy* trick.'

Previous to introducing the mermaid to the 'cute people of New York, Mr Barnum contrived to create for it a wide reputation as a curiosity, by means of a very ingenious stratagem. A letter was sent to the *New York Herald*, dated and posted in Montgomery, Alabama, giving the news of the day, trade, the crops, political gossip, &c.; and also an incidental paragraph about a certain Dr Griffin, agent of the Lyceum of Natural History in London, who had in his possession 'a remarkable curiosity, being nothing less than a veritable mermaid taken among the Feejee Islands, and preserved in China, where the doctor had bought it at a high figure for the lyceum,' &c. About a week afterwards, a similar letter, dated from Charleston, South Carolina, was published in another New York paper. This was followed by a third, from Washington, published in another New York paper, and expressing a hope that the editors of the New York papers would beg to have the mermaid exhibited in the 'empire city,' before its removal to London. Two or three days after the publication of this thrice-repeated puff, Mr Barnum's agent—who had assumed the name of Dr Griffin—was duly registered at one of the principal hotels of Philadelphia. His gentlemanly and dignified manners, and his sociable temper and liberality, gained him a 'fine reputation;' and when he paid his bill one afternoon, previous to setting out for New York, he thanked the landlord for his courtesy, and offered to let him see something extraordinary: this was the Feejee mermaid. The host was so highly gratified, that he asked permission to introduce some of his friends, including certain editors, to view the wonderful specimen. The result was the publication of several elaborate editorial notices of the mermaid in the Philadelphia papers, which thus aided the press of New York in spreading abroad its fame. Of course all this work, with printer's ink, as Barnum loved to call his billing

and puffing manoeuvres, was but the prelude to the one grand object, the exhibition of the mermaid, which was obtained as a great favour, and 'positively for one week only,' &c. The sequel may be guessed—the mermaid became ultimately a chief attraction of the American Museum.

At home, we are nearly quite as clever. The romantic history of two children, who were carried through the country for exhibition a few years ago, will be fresh in the recollection of our readers. We may call them the 'Bird-children,' and a first-rate story was got up about their having been stolen from one of the mysterious cities of Central America, where they had been worshipped as idols. The public were treated to a series of wood-cuts, shewing the dangers encountered in carrying away the children from the temple. We need not enter, however, into the details of this romantic story, being in possession of truthful details of their real history, which is as follows: The children in question were found in a show in America exhibiting along with a great pig. They were purchased, or, in showman phrase, 'committed to the guardianship' of a person who exhibited them in a penny-show throughout the States, in company with a large picture, roughly painted on canvas, entitled 'Death on the Pale Horse.' While they were thus being exhibited, they were seen by 'an eminent professor of legerdemain,' who, being struck with the idea of bringing them to Europe, entered into a partnership with the person who was exhibiting them. They were at once brought to London. A good story about them being necessary, this was written in the parlour of the White Hart Tavern, Catherine Street; and the *locale* of the position of the city in which the children were said to have been found, 'fixed up' by studying the *terra incognita* of Central America on Mr Wyld's model of the globe in Leicester Square. The children being dumb, it was determined to account for this by stating that they were the degenerate descendants of the 'Birdmen' of olden days, preserved in the temples of Iximay, and worshipped as idols; that silence indicating their sanctity, they were never permitted to hear a human voice, in order that they might never speak; whereas, in reality, their dumbness resulted from their abnormal character—the want of brain, and consequent want of ideas. These children were born at San Salvador, in Mexico, and were originally kidnapped from their parents, who were natives of that place, by a showman who travelled with wild beasts. The real curiosity of the Bird-children consists in their being *aphelous* children; whereas most infants born without brain, or rather with cerebellum and without cerebrum, die at their birth, and get pickled in show-bottles, and exhibited in museums.

Another show of a similar kind, so far as its getting up was concerned, although from circumstances not so successful as a pecuniary speculation, was very recently before the public. It was an exhibition of two female negro children indissolubly united by nature, and therefore considered by the showman to be, like the Siamese twins, 'a certain fortune.' The real history of these children differed considerably from the romantic version of their history palmed off on the public. The advertisement heralding their appearance was headed *A Romance of Nature*, and announced that the twins would hold 'drawing-room levees,' and that the prices of admission were fixed at two shillings during the day, and one shilling in the evening. Then came a little bit of the story, which was as follows:

'These interesting children, indissolubly united by a mysterious freak of nature, are of African descent, and were born in Columbus, County North Carolina, United States of America. Their parents are persons

of more than usual intelligence and piety, being both members of the church. These children are now five and a half years old, and are named respectively Christina and Milley Makol; and their brief history, like the wonderful action of nature which has for ever joined them together, is yet another illustration of the old adage, that "truth is stranger than fiction." In the winter of 1853, a surgeon, of North Carolina, while on a visit to an old college chum, heard of these children, and upon seeing them, and learning their history, he expressed a desire to purchase and take them to the free states, a desire which was greatly strengthened when he thought of the wonder such a curiosity of nature must excite among men of learning and science. The purchase having been negotiated, the children were carried by the doctor to Philadelphia. Unfortunately, however, shortly after he had carried his benevolent intention into effect, the doctor died, and the poor children were thus thrown destitute on the charity of the world.

'The attention of the exhibitor having been drawn to their condition, he undertook the charge of them, made arrangements to proceed with them to Europe, for the purpose of exhibiting them to the learned and curious, intending, if the exhibition should realise a sufficient sum of money, to make these helpless infants the means of ultimately freeing their parents from slavery. Upon the arrival of the children in this country, and after all the preparations for their exhibition had been made, they were stolen from the exhibitor by a body of prize-fighters, hired in London for the purpose.

'But in the interim, the showman had opened up communications with his agents in America, which have resulted, after putting him to great trouble and expense, in his freeing the mother of the twins from slavery, trusting to be reimbursed for his outlay by the consideration of the public. The mother arrived at Liverpool on the 1st of January 1857, in the steam-ship *Atlantic*, Captain Eldridge, and the meeting between the children and their parent, from whom they had been so long separated, was very affecting.

'The ablest physicians and naturalists, both of this country and the United States, have pronounced these children the greatest living curiosity; and their manners and appearance are strikingly calculated to make a favourable impression upon the visitor. In fact, their lively conversation, cheerful and enlivening songs, &c., evince them to be two of the most interesting and intelligent specimens of the negro race.

'The proceeds of the exhibition, after paying expenses, will be applied to assist in rescuing from slavery the father, and the brothers and sisters of the United African twins.'

The latter portion of the history was 'the great dodge' with the showman of the black twins. A pamphlet, containing a more elaborate history of the children than could be contained in 'a card,' was written, and was about to be published when the exhibition left Edinburgh. We have seen a copy of it, and think it equal to anything of the kind. The horrors of slavery were delineated at great length, and with considerable power; and the children, having been nearly shipwrecked on their passage to this country, something striking was also introduced about that. The brochure concluded with a strong appeal to the benevolent to assist the showman in raising funds for the rescue of the family. Of course, not a word of all this was true, and the children were actually exhibited in this free country by their 'owner,' an American slaveholder, who, finding that the money did not come in so quickly as he anticipated, has long since retreated to his stronghold in the new world, carrying his 'property' with him.

These of course belonged, like Tom Thumb, to the high-class shows, the bills and other puffery being

got up quite regardless of expense, and the prices charged for exhibition being proportionate to the lavish outlay. We will now say a few words about the penny-show, which is undoubtedly the commonest feature of the exhibition-world of the present day. Poor Barnum was sadly chop-fallen, upon his arrival at Liverpool, on being told that a penny was the usual sum charged for the exhibition of dwarfs, spotted boys, &c.; and when an enterprising exhibitor, in the wax-work line, called and offered to engage both Barnum and the General, in order to exhibit them at three-halfpence, the great American showman's heart literally sunk within him. He had in his mind's eye a grander scene imaged out for Tom Thumb than the booth at a fair, and that he realised his ideas on the subject, we all know from his book. The country-fair is the great field on which the penny-showman fights his battle of life, industriously wandering from one fair to the other, in most instances with the show on his back, and accompanied perhaps by his better-half, carrying the child. At these places are usually congregated a multifarious crowd of exhibitions, swings, merry-go-rounds, Punch and Judies, and living skeletons—the general price of admission being limited to the coin we have indicated. What a powerful cause of excitement to the whole country round is that almost indescribable scene, 'the fair,' where, as we used at one time to think, all the wonders of the world were concentrated, where, under canvas roofs, there was a heaven upon earth, since the very angels could not be more beautiful than the beautiful being who danced on the tight-rope in the travelling circus. A whole street of shows, with the caravan of wild beasts, containing the great lion-king in the centre of one side, the grand original Cirque Olympique being *vis-à-vis*; and next door to these we had a theatre, with *Blue Beard*, the *Castle Spectre*, *Fortune's Frolie*, and a pantomime every twenty minutes. On either side ranged booths of various sizes. One held the astonishing black brothers, Muley Sahib, and Hassan, celebrated for jumping down each other's throats, with lighted candles in their hands; another contained the only real yellow dwarf now travelling. In the immediate neighbourhood of these celebrities were located the great Hibernian conjuror, the pig-faced lady, the spotted boy, the Norfolk giant, the wonderful black giantess, the far-famed ventriloquist celebrity, the original theatre of arts, containing the best storm at sea ever yet invented, the fire-legged sheep, and the sea-unicorn—these two in the same booth—the learned pig, and a host of similar exhibitions. All around was the busy hum of the show, the eternal iteration of 'walk up, walk up, ladies and gentlemen;' the grinning of clowns from the 'parade' of the booths, the tumbling of posturers, the ceaseless whirl of the merry-go-round, the popping of the pop-guns at the nut-stalls; the shrill squeak of Punch; the everlasting crack of the ring-master's whip in the Cirque Olympique; the terrific growl of 'the celebrated spotted hyæna,' or the cry of 'the jackal, the lion's provider,' in the neighbouring menagerie; the clash of cymbals, and the sound of the drum, as well as the terrific clangour of the gong, used by the actors in one of the theatrical booths to announce the awful doom of *The Bloody Unrper*, or the *Caledonian Bloodhound* and the *Hag of Cape Wrath*, sounding every half-hour, or at the exact period 'the doomed baron' was tossed into the 'bloody foam,' amid a magnificent display of fireworks—two squibs and a blue-light—all these sights and sounds were mingled with the sharp 'move on there' of the watchful policeman. And the myriad crowds of gaping rustics circulated up and down, wondering, no doubt, whether the giantess inside would really be as big as the one painted on the canvas outside; or

whether the great Hibernian conjuror could, in solemn earnest, eat fire, and bring out yards of ribbon from the innermost recesses of his intestinal canal, as he promised in his speech; or what kind of a show 'Hajax, a defyin' of the littenin', might be, and whether there was really any difference between the lion and the dog, in the renowned combat, except—the skin; or whether the whole scene was not a mockery, a delusion, and a snare; and whether it would not be better to spend their money at the ginger-bread stalls, than risk it upon the great sea-serpent—seeing that there were three of that genus in the fair—or the cobra capella, or the albino lady, or any of the hundred other exhibitions that dotted the show-ground?

All this lasts, however, only for a day. The morrow comes, and the magic of the scene is over, the dregs of the excitement alone remain, and all who have taken part in the orgy are fatigued and *blasé*. The tents are speedily struck, and the show-folk are again on the move to the next place of rendezvous. The roads are covered with caravans; the great wagons containing the unequalled menagerie of wild beasts hurtle slowly along the dusty highway, closely followed by the circus and its 'stud of ighly trained hanimals,' and the theatrical booth with its blood-thirsty dramatic paraphernalia. Following in the wake of these we have the clean little pigmy wagon, with its brass rails and polished knocker, which the showman calls his living wagon, and which is looked upon by the fraternity as an index of social condition—as we have been informed that 'it has always been considered a proof of the showman's improving circumstances when he adds the living wagon to his establishment.' The road from the fair is but the road of life. We have the aristocrat of the 'perfection,' travelling comfortably in his gig, his wife and family settled, may be, in a pleasant farm in the country, from whence the food for the animals is obtained; the middle-class showman rides again in the wagon; the next class move on in their donkey-carts; while the lowest grade of all leave the fair as they came to it—on foot—the man with show on back, and wife and child trudging patiently by his side, happy in having collected two or three pounds' worth of penny-pieces by the preceding day's exertions.

This part of our subject naturally leads us to a consideration of what has been called the showman's 'mission,' touching which a grave political journal condescended, once upon a time, to leave off politics and discuss the social position of the 'brutal showman,' and his victim, 'the show.' The line of argument adopted was, that the pig-faced lady, the spotted boy, the yellow dwarf, and all similar exhibitions, were in the position of slaves, held captive against their will, in order that the showman might grind them into cash. Now, seeing that it is within our own knowledge that a pig-faced lady has been manufactured out of a shaved bear, we cannot help thinking that, in her ladyship's case, the best thing that could have happened, both for herself and the public, was her being strictly retained in slavery by the showman. Giants and giantesses, again, may be presumed to be so well able to take care of themselves as to be beyond the pale of our sympathies; while the spotted boy, seeing that his spots are amenable to the well-known action of soap and water, may be considered one of the knowing ones himself. And as to the 'victims' of the showman in general, we beg to inform all who may feel interested in the question, that they are great adepts in the art of what is vulgarly called taking care of 'No. 1.' In fact, to speak the truth, the 'show' is often more than a match for the showman; and we once knew 'a wild Ingian' who made little ceremony about hiring a new master whenever he thought the present one slow in his duty.

To conclude, we might greatly enlarge our gossip

about shows and showmen, and so evince our extensive knowledge of the various dodges peculiar to the exhibition world, and to the 'mission' of the pig-faced lady—but we pause for the present, although it may be that we may find another opportunity of still further illustrating THE AGE OF SHOWS.

ARTIFICIAL ICE-MAKING.

'THIS our planet' is for the greater part a sunburnt one. How things may be, as to heat and cold, with our neighbours further afield, it is not our present purpose to inquire; but considering our position, in point of nearness, to the central luminary, it cannot excite surprise that the inhabitants of our globe should for the most part experience, in an inconvenient degree relatively to their physical constitution, the power of his rays.

Even during the short summers of the north, the heat is oppressive; it is still more so in the long ones of the temperate regions; while the wide tropical belt embracing the greater portion of the earth's peopled surface and the vast majority of its inhabitants, suffers an almost continual oppression and distress from its exposure to the unmitigated glare.

Under such circumstances, the supply of ice, where it can be obtained, becomes next in importance to that of the absolute necessities of life. It so happens, however, that within the tropics, where it is most needed, it can scarcely be procured. In vast regions it is wholly unknown; while in Southern Europe, and other places in more temperate latitudes, ice can be had in abundance, and at a moderate rate, in many favoured localities.

In these special, fortunate instances, the source of supply is accessible as well as inexhaustible, and the cost representing only that of the manual labour required for transport. Thus, the 'snow-harvest' of Naples has long been an interesting subject of observation for the statistician, employing, as it does, a considerable number of hands, and a numerous army of small-craft, by whose means the treasured snow of Etna is conveyed to the burning streets of the capital; and the sweltering Neapolitans are served with their indispensable *sorbetto* in the highest state of perfection.

In that country, where labour is at a price almost nominal, and a man will be content, as Forsyth says, 'to wind up the rattling machine for a day with a few fingerings of macaroni,' it is doubtful whether any method of obtaining the same result artificially would be worth inquiring after; but, as very few places can boast of the same advantages, the question of ice-making by chemical means has long been a deeply interesting one, and engaged the attention of naturalists and philosophers.

The judicious and habitual use of ice as a cooler of ordinary beverages, and as a sort of eatable, in the way we all understand so well, is the one available resource against the debilitating and enervating effects of heat, whether encountered within the tropics, or during the summers of more temperate regions. Hitherto, the great expense attending its use, whether natural or artificial, has been for the most part an insurmountable obstacle.

We ourselves know a lady whose husband was forced to resign a valuable governorship in a tropical climate owing to her health giving way; it being, at the same time, the opinion of her medical advisers that nothing more than a sufficient supply of ice was needed to enable her to remain. The invaluable tonic property of iced beverages renders them effectual in cases such as this, when the *materia medica* can supply nothing as a substitute, and gives to this substance a balm altogether distinct from any it may have as a delicious momentary refreshment. We, for our

own part, do not pretend to despise it in this latter capacity; but it is rather in relation to the high importance of ice in a medical and sanitary point of view, that we have brought the subject before the public at this moment.

Artificial ice-making has long been practised on the burning plains of India. It is made by exposing water during the night in unglazed earthen pans, and a very thin coat of ice is thus procured each morning. This resource is, however, partial in every sense, and can in no way meet the necessity of the case. The great pains required and taken for so small a supply only shew the great value attached to the commodity. Other modes of obtaining the same substance have been introduced from time to time, but, as before observed, at an almost prohibitive expense.

In many cases where great heat is felt in the lower levels, a tantalising scene is presented; for snow lying on lofty hills is in sight of the panting dwellers on the plains below, but quite inaccessible for all useful purposes. We ourselves spent a hot summer, a few years ago, in an Alpine region, where a glacier, containing thousands of tons of ice, was within an hour's walk of our house; and yet, such was the difficulty of procuring a regular supply, that we were forced to abandon the attempt, after getting the apparatus necessary for domestic use into readiness.

It has long been known that artificial ice may be obtained by chemical means. By availing ourselves of the property of quick evaporation possessed by ether and other volatile liquids, this effect can be produced at pleasure; the only difficulty being the expense, which, on the grand scale, is prohibitory. A man wrapped in a flannel dress, and kept moistened with ether, may be frozen to death in a very short time under 'the line.' In fact, the warmer and drier the atmosphere, the more speedily will the effect be produced. A bottle of wine or other liquid so treated will freeze, or become ice, most effectually. Even the evaporation of water under a strong sun produces an excellent effect in cooling down liquors in warm climates; and 'coolers' of unglazed earthenware saturated with water, and then placed in the sun with the bottles of liquor within, will 'render up their trust' in a very desirable state of refrigeration after an hour or so.

But the most wonderful fact connected with ice-making is the glorious experiment by which water was frozen in a capsule of platinum at a *white heat*. This wonderful achievement proceeds upon the theory, that water will not touch a body of metal heated beyond a certain degree. A most important fact it is for all connected with steam-producing, that it will assume in such a case a spheroidal shape, and that a clear space will be preserved between it and the glowing metal, owing, doubtless, to the repulsive effect of great heat in all cases whatever.

Professor Faraday has carried this marvel even a step further, and actually frozen a ball of *mercury* in the midst of a glowing furnace, by the judicious admixture of carbonic acid and ether, so as to give greater vigour to the evaporating process.

We merely allude in passing to these more recondite matters connected with refrigeration, as they will prepare the reader for the process of ice-making on the grand scale, which it is our object to explain, resting, as it does, on the essential principle of rapid evaporation; and, to express it technically, the consequent abstraction of the *caloric* contained in the substance to be acted upon.

All we see, all we are, and all the changes that have taken place in our world, seem to be referrible to the fact of *heat*. Rocks are hard and 'solid' because they contain now only a certain amount of *caloric*. With more of it, they may be fused, and, with still more, *evaporated* like water.

Keeping this principle in mind, we shall see that water, in the liquid form, depends for that form on its actual *calorific* state; with more heat, it would evaporate; with less, it would congeal into ice. The object, then, of artificial congelation is to extract the *caloric* from it, and this may be done by evaporation, as we have mentioned.

The highly interesting process for which all this preparatory matter is intended to prepare us, is this: An ingenious inventor has now produced a machine, by which the invaluable properties of ether as an evaporator are fairly called into play, and thus large quantities of ice can be speedily produced; but he has done much more; for he contrives matters so that the precious liquid is *recovered* after it has done its work, and employed over again, for any number of times, without the slightest loss!

It would be difficult, if not impossible, to convey to the general reader a clear idea of the machine itself without the aid of engravings; and even these do not convey—at least to us—any notion of *how* the result aimed at is obtained. We shall therefore confine ourselves to a description of the principle of the machine, and an enumeration of what may be called its achievements.

'The evaporating vessel is merely a tubular boiler. In this, the ether will boil at a temperature much below freezing-point. The ether is contained in air-tight vessels relieved from the pressure of the atmosphere. The cylinder, in the centre of the apparatus, is fitted with air-tight valves, so that each stroke of the piston withdraws a quantity of ether-vapour from the left-hand vessels, and forces it into a condensing vessel on the right hand. When the vapour is raised, an intense cold is produced; when it is condensed, a corresponding degree of heat is evolved. The ether, after resuming the liquid state, returns by a self-regulating valve to the evaporating vessel, and the process thus continues uninterruptedly, and without the slightest waste of material. Indeed, as the pressure inside the vessel is less than the outside atmospheric pressure, it is impossible that any ether can escape.'

It will be seen that the evaporation of ether goes on in this machine in a cold medium, and that, *vice versa*, it is re-liquefied for further use in a warm one, being a reversal of the ordinary processes—as with water, for example. Intense cold being produced in the machine, this cold is utilised and conveyed to the freezing portion of the apparatus by the ingenious employment of a stream of *salt* water, which does not freeze at the same degree as fresh water does. It thus carries with it, in a fluid state, cold enough to freeze rapidly the fresh water with which it comes in contact. This salt water circulates in a continued stream also, being returned to the 'boiler' again after having parted with its cooling power. Thus, it will be seen, no waste of material is incurred, except of the fresh water, which it is the object of the operation to convert into ice, and of the fuel and water necessary for working the engine.

'The ice,' we are informed, 'can be made of any required shape or thickness. It is at present turned out in slabs of eighteen inches square on the sides, and an inch and a half thick. These slabs can be placed together so as to form blocks of any thickness. The ice formed rapidly at the coldest end of the trough is white and opaque, while that formed more slowly at the lower end is more transparent. By increasing the dimensions of this trough, and thus insuring more uniformity of action, the ice will be transparent throughout. The white ice is colder, and more effective for immediate use, but it does not bear carriage so well as the other. Experience must decide which is preferable for general purposes.

'The expense of the process—an important point—

is simply that of the motive power. An ordinary steam-engine of ten horse-power consumes a ton of coal per day, and the product in ice will be four to five tons. The removal of the ice when formed, and refilling the moulds with water, are the only parts of the operation requiring the services of an attendant. The whole expense of making ice in London, including interest on capital, &c., will be considerably less than ten shillings per ton.

'It is in hot climates, however, that the full value of the invention will be felt. Ice, within the tropics, will soon be looked upon as a necessary of life; as much so at least as fuel is a necessary in the winter of temperate regions. The preparation of cooling drinks is one of the least important of its uses. The preservation of animal food, and the cooling of apartments, will be the most important.'

The process is applicable to many other purposes, however, such as the cooling of worts—a matter, sometimes, of great difficulty and expense even in London. The inventor estimates the expense of cooling a barrel of worts from 75 to 55 degrees at 1½d. The salting of provisions in warm weather is also a great difficulty—sometimes almost an impossibility. By this machine, the brine of the meat itself can be brought to the temperature best suited for success. But perhaps the most beneficial application of the process will be to the cooling of rooms in hospitals and in tropical regions. The fearful mortality arising from the prevalence of fevers, in an atmosphere varying from 80 to 100 degrees, can only be checked by keeping the patients in cool apartments. It is evident that buildings can be cooled, as they are now warmed, by the circulation of water in pipes. The cooling of the water for this purpose is estimated at a few pence per barrel.

'Mr Harrison's first machine was made in Geelong in 1855, but, from the inferiority of colonial workmanship, the trial was a failure. Discomfited, but not disheartened, he came to England, and achieved success. He has wisely abstained from bringing his invention prominently into notice, until he has had it fairly tested both on a small and a large scale.'

For these latter particulars we are indebted to the *Illustrated London News* of May 29, 1858, in which an engraving of Mr Harrison's machine is given, but which, as before observed, can convey but very little idea of the process.

THAT FARTHING.

I do not believe in trifles. What we are in the habit of calling by that name have changed the prospects of a lifetime, or even brought life itself to a close; and I doubt much whether the same thing would appear equally trivial to any two persons.

Some time since—I will not say how long—I received a letter, and enclosed with it a post-office order for two guineas. In the missive that sum was alluded to as 'the trifle due to you for so and so.' 'Trifle indeed!' thought I. 'I wish I was able to speak so disrespectfully of a couple of guineas.' The fact is, I was penniless when that opportune supply came to hand; but I cannot say I was without a single coin. I had in my possession one farthing, and on it—a trifling matter, you will say—hangs my present story. That farthing had come among some other change; and as one does not often happen to want that particular coin, it remained long after its kindred browns were scattered. Besides, I confess I should not have liked to tender a farthing in payment. Even if that would have exactly sufficed, I should have preferred offering any other coin. My consciousness of extreme poverty made me suppose that any looker-on would be able to read my penury, if I were seen to draw a farthing from my waistcoat

pocket. A rich man can afford to seem poor, but a really poor one never.

Thus that farthing remained with me for months. It clung to me, as a poor friend often does, long after his wealthier brethren have departed; and it certainly looked a trifle in comparison with the two sovereigns and two shillings, for which I lost no time in exchanging my bit of official-looking paper; but the future vindicated its importance, and taught me its real value. When I rose from my bed that morning, I had every prospect of dining with a certain titled personage whose table is proverbially accessible to all, though only the very poor avail themselves of it. With a good appetite to appease, and a couple of guineas in my pocket, this was, not to be thought of. I dined, comfortably and substantially, and that done, leaned back in my chair with a feeling of ineffable contentment.

Searching in my waistcoat-pocket for my toothpick, my finger and thumb came in contact with that farthing. I drew it from its hiding-place, laid it on my extended palm, surveyed it, now on this side, now on that; but with what a different look from the useful one with which, two hours sooner, I had gazed on the thing, did I now regard it! Well, thought I, I was never before reduced quite so low, but before absolute want came a supply to meet my approaching need. I will keep this farthing while I live, as a memento to whisper, 'Never despair; when I am inclined to murmur at the decrees of fortune.'

I adhered to my resolve. Regularly as I changed my waistcoat, the little coin accompanied my pencil-case, penknife, and toothpick, to the corresponding pocket of the new garment.

Singularly enough, from the time of my being reduced to a farthing, fortune ceased to frown. I had not finished the first of the two guineas before others came, and still more followed. It seemed that my penniless hour was the one before the dawning, and the labours which preceded it were to meet their reward. I found popularity when I least expected it, and soon I, too, began to consider two guineas a trifle. Instead of a single garret near the sky, I occupied apartments at the Albany; and when I went to visit my native place, good gracious, how I was fêted! The tide had indeed changed. As a boy, what scrubbing had I not endured, and all arising from my ambition to become famous as a writer—that scribbling mania which impelled me to cap verses instead of doing my Latin exercise, and which brought down on me the wrath, and, worse still, the cane, of the Rev. Dr Snaffles, head-master of the grammar-school, and vicar of the parish. Awful, most awful, were both his lectures and his whacks; I got the lion's share of both. My father lectured me also, and gave me a long list of the names of those who, preferring the shadow, authorship, to the substance, trade, had died in poverty after a lifelong endeavour to ascend the steps of Fame's temple—steps to them only a mental treadmill, where, compelled to incessant efforts, they yet rose no higher. 'Do not fancy yourself a genius, my dear boy; he would say: 'talent you possess—that is, you appreciate and take home to your heart the good and the beautiful in the works of others; but do not mistake this for genius. Genius creates for talent to appreciate. The latter I give you credit for possessing; the former you have not. Stick to the counting-house; make your fortune; and then, if the wind remain, write verses and tales by the mile.'

My sisters condemned my rhymes, perhaps because I addressed none to them; but, worse than all, Flora Snaffles, the object of my idolatry, did the same. Flora was the doctor's youngest and loveliest daughter, and just my own age. But what girl of sixteen ever deigned to look at a boy of her own years?

Nevertheless, I looked at her fair face, soft brown eyes, and flowing chestnut curls, and worshipped Flora, quite forgetting the difference between a boy and a young lady.

But what boy-poet was ever without a divinity? So to her, after expending an amount of toil and thought which no after-work of mine ever cost me, I addressed sundry verses, entitled *Lines to Flora*. And what was my reward? I met her, with her confidante, Lucy Jones, the lawyer's daughter, and as they passed, she said, at me, but to Lucy: 'Poor, foolish boy, I shall not tell papa, for I should not like him to be whipped.' And she tossed her head, shaking the glossy curls I had been striving to immortalise.

There was only one, my gentle mother, who gave my luckless compositions a word of praise. She, bless her! used to soothe my ruffled vanity, call my verses pretty, and kiss my forehead with right loving touch; but she bade me obey my father. The end of it all was that, after distinguishing myself for deficiency in Latin at the school-examination, and filling my father's ledgers with poetical in place of arithmetical figures, I forsook the counting-house, and went to seek my fortune, with a resolution not to return if unsuccessful. How different was my coming home!

Before leaving my bachelor's nest in town, I determined to sink the literary man, and give myself up, heart and soul, to that home-life on which I had often cast longing backward glances. Authors soon grow old: if they intend to succeed they must be sharp-sighted, and a man who battles his way upward a hairbreadth at a time, comes in contact with a sufficient number of rough edges to brush away early any superfluous juvenility of feeling. In place, however, of renewing my lost youth, and resuming my old home habits, I was doomed to be exhibited as a 'lion' of the first-water. My father publicly owned he had made a great mistake in his estimate of my mental powers. My writings having been, in a great measure, published anonymously, everybody gave me credit for more than I deserved, and, do as I might, the Mudborough folk persisted in thinking it necessary to talk only of literature in my presence.

My former preceptor was amongst the first to call upon me, and a few days after my arrival, I spent an evening at his house. Again and again did the reverend doctor shake my hand, his firm grasp reminding me very much of days when I trembled under his touch. He introduced me to his guests with great pride as a pupil of whom he was justly proud; 'though once,' he added, 'I fear I scarcely appreciated the peculiar talents you possessed. In that I was not, I believe, singular. A prophet, my dear Dick—pardon the familiarity—is never without honour, &c.'

And there was Flora—Flora Snaffles still—more beautiful than ever. She did not say, 'Poor, foolish boy' now, but placed her hand in mine; and with a gentle, half-hesitating voice, bade me welcome to the vicarage, dropping those bright eyes the while, and letting her luxuriant chestnut curls almost shade her fair face.

She and I got on amazingly. A little later, she brought her album, begging for some contribution in addition to what she already possessed. This last remark required solution, and the bright eyes were archly raised as she pointed out the maiden effort of my muse in a state of perfect preservation. Need I tell what such a beginning led to. Coming home, as I did, with a predisposition to renew all my old loves, and finding there not only the charms of memory, but of novelty also—for of late my life had been so different—is it wonderful that the divinity of my school-days became the goddess of my riper age.

There is a certain homely proverb, much in vogue

where I was born, which says: 'Old broth is sooner warmed than new broth made,' and it is commonly applied to lovers who make up matters after a separation. I verified its wisdom. Flora was very beautiful; she had preserved those verses, which proved that her former indifference was only assumed, and she plainly regarded me as the greatest genius in the world. We got a long way in a little time. My sisters began to giggle and look slyly at me when Flora's name was mentioned. Other young ladies, shaking off the awe my literary reputation at first inspired, and finding me in society quite as commonplace as any other man, demurely sought information respecting the mythology of the ancients. They never forgot to ask some question about the floral goddess, whether poets still worshipped her as they felt tempted to believe, &c. Doubtless all this seems silly enough to tell about, but I deemed it very pleasant folly then. Yet smoothly as my love-affair seemed to progress, I was very jealous. Not of any other male individual; I flatter myself there was little risk of successful rivalry to annoy me. The cause of my vexation was a certain Dorcas Society, an admirable institution, yet I hated its very name, because Flora bestowed so much of her time upon it. A species of amiable rivalry existed amongst the young ladies as to the amount of work contributed, and Flora made herself a perfect slave in the cause. If I asked her to sing or play for me, she would cast a glance at a nameless garment on her lap, and beg me to excuse her; until I remonstrated, saying, she really overdid the thing, and made those who wished to claim a little of her time quite jealous of this all-engrossing labour.

It lists not to tell how the point was argued between us; Flora insisting that she did not take one stitch more than it was her duty to do as the vicar's daughter. She seemed almost inclined to pout at my persisting in a contrary opinion, and was mollified only when I promised to make one at the anniversary tea-party in connection with the Society, which was to take place on the following Wednesday. On the Tuesday, I made myself generally useful, and assisted to decorate the national school-room for the festival, receiving the boughs of evergreen and paper-roses from the fair hands of my lady-love. I was rewarded with many a gracious smile, and more than once had the delightful task of disentangling a spray of holly from those lovely chestnut curls.

'You must come to my table,' whispered Flora as we parted; 'and, remember, I shall expect a contribution from you, to make amends for your unkind speeches about the Society.'

'As though I could ever have breathed an unkind word in your ear,' said I, pressing the soft palm which lay in mine.

The day came. I duly *teased* in public, and, I flattered myself, entered into the spirit of the thing, by zealously promoting the locomotion of the cups. After tea came the platform-work—addresses, reports, and vote of thanks to the fair labourers. Lastly came the collection, and Flora stood before me, holding a delicate china plate, on which her eyes were bashfully bent, to receive my contribution. I had placed a sovereign ready to hand, and as I deposited the coin in the plate, looked keenly at Flora to see how she relished the gift. Fancy my surprise on seeing the delicate head thrown back, while a look of ineffable scorn was darted at me by the fair plate-bearer, whose face now wore the hue of the deepest-coloured paper-rose. She swept past, and that night I saw her no more; so, in place of escorting her home and popping the question on the road, I had to give an arm to each of my sisters. I could not understand it, especially as the two girls would deign nothing but monosyllabic replies to my questions, and made themselves

as disagreeable as young ladies can be supposed to be. As my sisters and Flora always 'sailed in the same boat,' I humbly craved to be enlightened by them as to the cause of this change in her manner.

'You ought to know,' said my sister Jane, with a toss of the head very similar to the one with which I had been favoured earlier in the evening.

'I. Why, what *have* I done?'

'To pretend not to know!' shrieked both girls at once.

'I do not know,' said I. 'I put a sovereign on her plate, and she gave me just such a haughty, disagreeable look as she did long years ago, when I foolishly sent her some verses.'

'A pretty sovereign!' again in chorus. 'But perhaps,' added Jane, 'you use a poet's licence to call all coins sovereigns. We ignorant country-people cannot be supposed to see these things in the same light as you great literary men.'

I was out of all patience. 'What do you mean?' said I. 'You are enough to drive one crazy with your absurd sneers and allusions. Do I want to be made a fuss about as a literary man? or what has that to do with Flora Snaffles?'

But I might as well have talked to the doorpost. They indignantly retired, leaving me to my anything but agreeable reflections. I slept little that night, and on the following morning rose early. On transferring the contents of my waistcoat pocket from the last worn garment to one more suitable for morning costume, the mystery of Flora's conduct was solved: the sovereign—my intended contribution—was still in my possession. *That farthing* was gone. I had carried it in my pocket until I had become almost unconscious of its existence; and, all unaware of the mistake, had transferred it to the collection-plate in lieu of its golden neighbour. Of course Flora had set it down as a studied insult—following, as it did, on the heels of our little dispute about the Society. I remember hearing the amount of the collection announced as thirty-two pounds, six shillings, and sixpence farthing, with some surprise, little deeming the unlucky fraction was my own contribution. I would not tell my sisters a word, but determined to have a delightful reconciliation scene with Flora. I pictured tears in her soft eyes when I told of my past trials, delight in her countenance at the romance of the thing, and charming confusion when the whole ended with a declaration of love. I almost felt her head on my shoulder, and its glossy curls in my caressing hand. With these feelings, I went to the vicarage.

'Not at home,' was the only reply to my inquiries for the family.

Never mind, thought I; a little suspense will enhance the bliss of the meeting.

I went again. I saw Dr Snaffles, who was stern, and monosyllabic. He was evidently in the secret; so I proceeded to explain.

He remarked in his most pompous manner, 'that my practical joke was decidedly out of place.'

I was indignant at the insinuation, but asked after the ladies.

'They were quite well; somewhere in the town, making calls, with the exception of Miss Flora, who had departed that morning by an early train to pay a long-promised visit to an aunt resident somewhere near the Land's End.'

And my holiday was just expiring; I could not await her return. I would not say anything to my sisters, being too indignant to take them into my confidence after their distant behaviour.

So I went back to town, resolving to take a run home again in a couple of months, never doubting that all would yet end well. Alas! that I should have it to tell. In six weeks from that date, I

received, *via* my sister Jane, the wedding-cards of Captain and Mrs Vernon, *née* Flora Snaffles.

She is in India now, poor Flora! and I am still a bachelor of the Albany. Trifles indeed! That farthing!

THE NORTHUMBERLAND HOUSEHOLD BOOK; OR, HOUSEKEEPING THREE HUNDRED YEARS AGO

IN TWO PARTS.—PART I.

ALL who have read Miss Strickland's lives of the Scottish queens, will remember the lively description she gives of a certain Earl of Northumberland, who rode forth from the gates of York, at the head of the northern chivalry, to welcome the daughter of his sovereign, the fair Margaret Tudor, then on her way to join her future husband, James IV. of Scotland.

The youthful princess was surrounded by some of England's choicest knights and nobles, all richly arrayed and gallantly mounted; but if contemporary chroniclers are to be relied on, the Percy far outshone them all; for, to borrow the quaint language of one of these, 'what for the richness of his cote, being of goldsmith's work, garnished with pearls and stones, and the costly apparel of his hennxmen, and gallant trappers of their horses, besides four hundred tall men, well armed, and apparelled in his collers, he was esteemed both of the Scots and Englishmen more like a prince than a subject.'

Nor can we wonder that he found such favour in their eyes; for, added to all this outward pomp and circumstance, he was in the prime of manhood, of a goodly presence, and the representative of one of the noblest families of the realm.

But pageants, however grand, last but their little day; and those who take even the most prominent part in them, when they have laid aside their velvet and ermine, their tinsel and their bells, are, in thought, word, and act, marvellously like other men. So with this gay and gallant cavalier, who, when a few more years have passed, we find very differently occupied; the head that had once been intent only on making his steed 'gambade' gracefully beside the Tudor princess, is now busily speculating on the relative value of fat and lean beef, or carefully calculating the cost of brewing a hogshead of beer. In other words, he is framing, with the assistance of a council composed of the chief officers of his household, a system of domestic economy, which, though intended only for the government of his own establishment, might, for the judgment and foresight it displays, claim a place among law-codes of much loftier pretensions.

A copy of this work, printed from the original manuscript in 1770, and entitled *The Northumberland Household Book*, is now before us; and as only a limited number were issued for private circulation, and it is probably but little known, a few extracts from it may find a not inappropriate place in pages like these; for it not only exhibits a curious picture of ancient manners and customs, but, by the minuteness of some of its details, furnishes hints on domestic management, such as are calculated to be of use in all ages. Few persons, indeed, find themselves called upon now-a-days to rule over an establishment so large as that to which this northern earl gave laws; but the more ponderous the machinery, the greater need is there so carefully to adapt its various parts to each other as to make all work easily and pleasantly together; and if, in his anxiety to effect this end, we find the noble author of the *Household Book* occasionally dwelling with almost tiresome precision on points which, to our modern ideas, seem trivial, we must make due allowance for the pursuits, or, to speak more correctly, perhaps the want of pursuit of the age

in which he lived; while we gather from his example the advantage of seeing, each in his own little sphere, that things be done decently and in order.

This curious manuscript was commenced in 1512, as we are by inference continually reminded, for its various enactments are all drawn up in right regal fashion, and if not given from 'our court at Wreail,' are at least 'ordayned by me and my counsaell on the 30th day of September, in the 3d yere of my sovereign lord king Henry the 8th.'

It opens with an assignment to 'Richard Gowge, comptroller of my hous, and Thomas Percy, clerke of the kechinge,' of various sums of money for 'the hole expensys and keepynge of my sayd hous for one hole yere;' and then proceeds to lay down minute directions as to the proportions in which every possible article of consumption is to be supplied, with the prices that are to be given for the same. To some of these we shall presently refer; but we must first try to collect a few particulars of the internal arrangements of this great establishment.

The family seems to have consisted, taking one month with another, of 166 persons, but 67 more were daily reckoned upon as guests, making in all 223. Of the regular inmates, some ten or twelve might be of the blood and lineage of the Percy; the rest were knights and retainers, grooms and yeomen, waiting-men and waiting-women, brought together to swell the all but regal pomp with which those proud nobles, the sometime companions of 'bluff King Harry,' saw fit to surround themselves.

Many of these officers bore titles similar to those used in the royal household, and were, as appears from the number of horses and servants kept for their separate use, as well as from their sitting at what was called 'the knyghte's boord,' gentlemen of good birth. Thus we read of my lord's chamberlain and treasurer, of the comptroller of his household, and the clerks of his 'kitching,' with a due proportion of gentlemen-uschers and grooms-in-waiting. Then, again, we have an almoner, a carver, and a sewer or server, whose responsible office it was to see that the dishes were 'straglyt sett upon the boord,' with cup-bearers for my lord and my lady, and henxmen (or pages) to wait beside them.

The titles given to others serve to illustrate the manners as well as the wants of that semi-barbarous age. The 'clarke of the ewery,' for instance, reminds us, especially when coupled with the mention of 'two wesching towels for my lord to wesch with, and a gentleman-uscher to bring them in, and to serve my lord with water when his lordship goes to dinner, and when he ryseth up,' of the necessity there must have been for such frequent ablutions at a time when forks were yet uninvented; and a child of the kechinge to turn the brooches (or spits), betrays a similar lack of convenience in the cooking apparatus then in use. Yeomen and grooms, again, to 'serve at my lord's boord-end,' marks the distinction which placed the heads of the family, with their principal guests, at one end of a long table; while the officers of the household, and all persons of inferior rank, sat at the other—the line of demarcation being indicated by a huge salt-cellar; whence the phrase often met with in old authors, of 'above and below the salt.' The 'clark avenar,' too, whose duty it was to yield an account of all the oats and hay consumed in the earl's stables, explains the former appropriation of the tower still shewn at Alnwick as the 'Avenar's Tower;' and the 'arris-mender,' who was to be 'daily in the wardrobe for working upon my lord's arras and tapestry,' conjures up the memory of days

When round about the walls yclothed were

With goodly arras of great majesty—

the said arras being merely hung up on tenter-hooks

against the naked walls, or, in some cases, suspended upon frames, and placed at such a distance from them as to leave space for persons to pass behind—a convenient arrangement, as it must often have proved, in those days of political and domestic intrigue. Falstaff, doubtless, but followed the example of wiser, if not better men, when, in a sudden accession of terror at the untimely approach of lively Mistress Page, he exclaimed: 'I will ensconce me behind the arras.'

These expensive hangings—for the art of weaving them was but newly introduced into England—being thus rendered easy of removal, were, as we are led to infer from subsequent entries, carried about with the family, and hung up wherever they happened to sojourn for the time being. Besides this arras-mender, there were several 'grooms, yomen, and childrene of the wardrobe employed hourly for the robes, sewing and amending the stuff, and brushing and dressing thereof;' some of the said 'stuff' consisting, it is likely, of the same gorgeous dresses which had years before dazzled the eyes of Miss Strickland's Somerset herald! But the taste for accumulating sumptuous apparel was, it must be remembered, by no means confined to the house of Northumberland; it increased to such a mischievous extent during this and the following reigns, that Queen Elizabeth thought it necessary to restrain it by proclamation; yet, with the inconsistency which often marred the otherwise bright character of this royal lady, she so far departed from the spirit of her own edicts, as to have left behind her at her death no less than three thousand dresses!

The occupations assigned to some of my lord of Northumberland's officers appear to us rather incongruous; thus, we read of a 'head clarke of the kechinge, to cum up with my lord's shirt;' and, more derogatory still to the dignity of the nobler sex, of 'a yoman of the beddes (whose name it may interest some to know was Gilbert Swinburn), and a groom of the chamber for keepynge and dressynge of it cleane.' The small proportion of females employed in those departments which modern habits leave exclusively to them, constitutes, indeed, a remarkable feature in this household summary.

The division of the day is another point on which the habits of the sixteenth century differ very materially from those of the nineteenth; and we can scarcely suppress a smile as we think of the long faces which such a regulation as the following would produce among modern lords and equerries in waiting:

'These be the names of the gentlemen-uschers, gentlemen of householde, yomen-uschers, and marchalles of the hall that shall awaite in the great chambre dayly thurrowte the weeke, on the forenoons, from seven of the clocke in the morning, to ten of the clocke, that my lord goes to dinner; whyche persons, for their waytynge before noon, hath licence at afternoon to go about their own businesse from the said noon to three of the clock that evinsong begins, and they not to fail then to cum in agayn, the rather if any stranger cumis.'

But the dinner, thus early served, seems to have occupied a considerable time in eating, for the services of those who took their turn of waiting in the afternoon were not required till 'one of the clock that dinner is done,' and were to continue 'till they ring to evinsong.' The castle-gates were locked at nine, 'to the intent that no servant shall come in which is out at that hour.'

Supper was served between four and five; but we are not told at what time the family retired, though the comptroller—himself, be it remembered, one of the head officers—was enjoined 'to call up the cooks every morning after four of the clocke be streiken.' Such very early rising seems not, however,

to have been quite in accordance with the tastes of his lordship's dependents: from some cause or other—it might be the soporific effects of the 'pottets of bere' that were so bountifully dealt out—slothful habits gained ground; and to avert the evil, it was ordained by my lord and his council, 'to have a morrow-mass, priest daily now to say mass at six of the clock in the morning throughout the yere, that officers of his lordship's household may ryse at a *dew* hour, and here mass dayly, to the intent that they may cum to receive the keys at the time appointed, by reason whereof my lord and strangers shall not be unserved.' Well would it be for the peace and order of many a modern mansion if some such stringent rule could be enforced therein.

The mention of this morning mass reminds us that the spiritual interests of the Earl of Northumberland's household ought to have been well watched over, seeing that he had no less than eleven priests connected with it: the occupations of several of these reverend gentlemen were, however, according to our notions, somewhat unpriestly; one being the surveyor of my lord's lands; another, his secretary; a third, the clerk of his foreign expenses—who, we are informed, by the by, always made up his accounts on the Sunday—and the fourth his master of grammar—to instruct, we suppose, the youth of his household in the orthography and syntax of their native tongue. Others of the priests were most consistently employed as chaplains and almoners, and one of them—appropriately called the 'Gospeller'—was for 'reading the Gospel in the chapel daily.'

The priests, whatever might have been their rank in the household, seem not to have enjoyed the privilege, extended to many other of the earl's dependents, of keeping a private servant; with one remarkable exception in favour of the almoner, who, if he be a *writer of interludes*, is to have a servant (or secretary, perhaps), to the intent for writing of the parts, and else to have none: a provision that bespeaks a degree of consideration for the claims of literature that we should scarcely have expected from the general tastes and pursuits of the age; but the subsequent mention in these pages of my lord and my lady's libraries, as well as the circumstance alluded to by the editor, of there being still extant a very curious manuscript collection of poems made expressly for this same earl, shews him to have been very much in advance of his times in his love and patronage of learning.

There is another still more remarkable proof of this in the fact of his having caused the walls of several of the rooms, both at Wresil and Leckingsfield, to be adorned with a variety of poetical inscriptions, all containing, in the form of proverbs, moral precepts well worthy of being remembered. We must confine ourselves to one or two of these. In one of the chambers at Wresil was a poem beginning with this useful advice:

When it is tyme of coste and great expens,
Beware of waste, and spende by measure;
Who that outrageously makethe his dispens,
Causeth his goodes not long to endure.

The family motto being 'Espérance en Dieu,' there were, in one of the rooms, the following rudely penned, but wise reflections upon it:

Esperance en Dyeu:
Trust in hym, he is most trows.
En Dyeu esperance:
In Him put thine affiance.
Espérance in the world? Nay,
The worlde varyeth every day.
Espérance in riches? Nay, not so;
Riches slideth, and soon will go.

How many a poet of undying name and fame has

written volumes which contain not half so much true wisdom as is set forth in these few doggerel lines.

Very minute rules are laid down for the 'orderrage' of the chapel at matins, high-mass, and evensong; and as a proof of the attention even then bestowed upon the choral service, no less than seventeen gentlemen and children are shewn to have been daily employed in it.

The custom, so frequently and pleasantly illustrated by Sir Walter Scott in his novels, of youths of high birth being placed in the household of some powerful nobleman to learn the arts of war and chivalry, is more than once hinted at in these pages. There seem to have been several residing under the earl's roof. They acted as cup-bearers and pages, and were probably companions for the earl's sons, to three of whom we are here introduced. The elder of these, 'my Lord Percy,' became celebrated at a later period as the youthful rival of his mature sovereign in the affections of the queen's maid of honour, the beautiful but unfortunate Anne Boleyn; and he is also mentioned in history as having been employed to arrest Cardinal Wolsey, when the once brilliant star of that ambitious prelate was flickering on the verge of the horizon. There are some curious entries in the *Household Book* connected with this young nobleman; for instance, we are furnished with a list of the number of horses which a magnificent earl of the sixteenth century deemed sufficient to support the dignity of his son and heir.

First, there was 'a great doble trottynge hors for my Lord Percy to travell upon in wynter;' and a second possessed of the same substantial qualities for him to 'ryde on owte of townes;' but when he approached the haunts of men, a more showy steed was thought necessary; and a 'trottynge gambalding' horse (such as his father himself had loved in his youthful days) was provided for 'my said Lord Percy to ryde upon when he cums into townes.' For his daily use, probably to ride about the home domain, he had 'an amblynge hors;' and strange as the fact may sound in the ears of modern fox-hunters, 'a proper amblynge litle nagge for him to ryde upon when he goeth hunting or hawking.'

These, with a strong horse to 'carry his maille with his stuf for his change when he rydes,' comprised his stud—the sufficiency of which, considering that the list was drawn up in anticipation only of his being 'at yeres to ryde,' none, we opine, will object to. A gentleman in waiting, a groom of the chambers, and a second groom for 'keeping of my Lord Percy's garments clean dayly,' formed the young nobleman's personal staff; and the services of at least one of these was shared with his next brother, for it was his duty to 'be always with my lord's sonnes, for seeing the orderynge of them.'

'Two rockers and a childe of the nurey to attende on them,' formed the nursery establishment of the little Lady Margaret and Master Ingeham Percy.

Of the female head of this princely mansion, we find less frequent mention than might have been expected; but there is enough to shew that if the Countess of Northumberland did, like high-born dames of the present day, take no very prominent part in the domestic arrangements of her household, she was at least well provided with the externals needful for upholding the dignity of her high position: my lady's gentlewomen, her chamberer, her pages, and her cup-bearers, are none of them wanting; and her name is always associated with her lord's in the orders laid down for the provision of breakfast, dinner, or supper, in a manner that bespeaks them to have been equally, unlike many fashionable modern couples, seldom asunder.

Of this noble lady, all we know is, that she was an heiress with the Plantagenet blood in her veins, being

remotely descended from 'old John of Gaunt, time-honoured Lancaster.' She survived her husband sixteen years, and at her death, bequeathed her body to be buried at Beverley, in the tomb of the late earl; and likewise gave to Sir Robert Gell, her chaplain, her lease at Wilterfosse, to sing mass yearly for her own and her husband's soul.

The trifling amount of remuneration given in return for the various services we have described, occasions us at first much surprise. Comparing it with the standard created in our minds by the present rate of wages, we are inclined to charge the magnificent earl with a degree of meanness quite inconsistent with his high pretensions; and the more so, when we learn further, that L.1000 is the whole amount of the year's assignment for the payment of all expenses connected with the household; but one glance at the relative value of money then and now, dissipates our surprise, and we find that a calculation founded on the prices of wheat and other articles of consumption in 1509 and 1854, would lead to a result much more in accordance with modern ideas. Leaving this problem, however, to be worked out by those better versed than ourselves in such statistics, we will proceed to give a short list of wages as we find them here set down, premising that it was the custom in those days for the nobility at certain periods of the year to retire from their principal mansion to some favourite lodge or cottage—styled here 'my lord's sacret hous'—where they enjoyed, like our own good Queen in her autumn retreat at Balmoral, the privilege of living for a brief season free from the incumbrances as well as the cares of state. As they no longer kept open house, the greater part of their servants were put on board-wages; some had 'licence to go about their own business,' and were no longer 'at my lord's fyndinge;' and the same appears to have been the case with several of the head-officers and the young gentlemen who held posts in his household, who are often spoken of as being at their own or their friends' finding. The salary of the priests varied from L.2 to L.5. The dean of the chapel, though of necessity a doctor, or, at least, a bachelor of divinity, received, if he lived in the house, only L.4; and the chaplains, if graduate, five marks; if not graduate, 40s.: the priests of the chapel, by which is probably meant those constantly employed there, were to have—the first, L.5; the second, five marks; and the third, four marks—always provided, however, that the most discreet of the three be appointed to be sub-dean, and to have no more wages! The treasurer, comptroller, and other high officers, 'if abydyng in the house,' received L.20 salary; but if 'cominge and goinge,' only ten marks. Forty shillings appears to have been the general rate of wages for yeomen, and 20s. for grooms; but there is a kindly thoughtfulness evinced by the following entry: 'Every futeman to receive 40s., because of the moch waring of his stuf with labor.'

My lady's gentlewomen had five marks, if not at 'my lady's fyndinge;' but what amount of deduction was made in consideration of beef, bread, and beer, we are not informed. The wages of the arras-mender aforesaid were L.1, 13s. 6d., with the addition of L.1 for 'fyndyng all manner of stuf belonging to his facultie,' except silk and gold.

Every servant was required, immediately on entering his lordship's service, to be duly registered and sworn in the presence of the head officers, 'either by such an oath as is in the Booke of Ooths, yf any such be, or els by such an oath [we give the extract verbatim] as they shall seyme beste by their discrecion.'

The price of wheat was at this time 5s. 8d., and that of malt 4s., the quarter. Meat appears not to have been sold by weight, for we find an order for

667 muttons, for the year's consumption, 'at 20d., the one with the other, fatte and leyne;' and a second 'for 109 fatte beefes at 13s. 4d., to be bought at All Hallowtyde, for to serve my hous from that tyme to Michaelmas; and 24 leyne beefes, at 8s. the pece, to be bought at St Elyn's day (May 26), and put into my pastures to fede.' Pigs—or porks as they are called—were 2s. the piece; veals, the same price; and lambs varied, from 2s. between Christmas and Shrovetide, to 10d. from that time to midsummer.

In an age when fasting was rigidly observed, and where meat was entirely banished during the long season of Lent, fish would necessarily be an important article of consumption; and we accordingly find large quantities laid in and dried. 2080 salted salmon are valued at 6d. the piece, and 'three ferkynges of pickled sturgeon at 10s. the ferkyng:' red and white herrings, 'sprotts,' and eels, are the other kinds thus prepared. Of fresh fish, the price is not given.

Salt cost 4s. the quarter, and vinegar 4d. the gallon! but the noble financier seems to have demurred rather at this item of his expenditure; for we find an order given, that 'for the future vinegar is to be made of the broken wines, and that the laggas [lees, we suppose] be provided by the clarke of the hous, and marked after they be past drawing, that they can be set no more a broche, and see it put in a vessel for vinegar.'

A CHAPTER ON DOGS.

'A POODLE!' Such is the title of an entire chapter of a current serial work, by one of our most popular authors, which naturally interests the public in the character and fortunes of the animal thus signally honoured; and as every dog has his day, independently of the dog-days and perennial puppyism, we may take the occasion to offer a few observations on the subject generally—the instincts, habits, and qualities of the species, and the education requisite to develop such peculiar talents as distinguish 'Sir Isaac,' the poodle hero of the novel alluded to, by Pisistratus Caxton.

About fifteen years ago, his—the poodle's, not Pisistratus's—prototype, or rather prototypes, for there were a brace of them, were exhibited by a French *savant* in the Regent's Circus, and excited so much attention by their performances as to be visited by many scientific naturalists, and other philosophic virtuosi, including the president and sundry inquisitive members of the Royal Society. They were certainly extraordinary creatures; and in the variety of their accomplishments, outstripped even the marvellous exploits related of Sir Isaac on his appearance before the mayor and inhabitants of Gatesborough.* But their owner, though assuredly born under Sirius, was not a mendicant showman. He, M. Adrien Leonard, had devoted twenty years to dog-study and dog-training upon philosophical principles; and he published, at Lisle, an *Essai sur l'Education des Animaux*, taking the dog for the type, in a goodly octavo volume of no less than 436 closely printed pages. The publication contained some new, and much curious matter, of which we propose to avail ourselves in the present paper. Nor is the subject unworthy of the notice of science, since Descartes discussed the question whether animals had souls, and inclined, moreover, to the belief that they had; G. Leroy drew able distinctions between instinct and intelligence; and Réaumur, Buffon, Cuvier, and a host of other eminent men, entered into the careful examination of canine attributes and the remarkable extent to which they were susceptible of cultivation.

M. Leonard, as might be expected from his success, goes the length of Descartes as the strenuous

* See Blackwood's Magazine for October.

advocate of superior 'intelligence,' and laughs to scorn Buffon's theory of action from impulses more or less balanced. He even accuses man of being too proud and biased in his judgment, through a sort of jealousy of the near approach to his boasted reason by the most sagacious specimens of the 'higher orders of animal creation.' 'We have a body,' he says; 'so have these animals. They have the same organs as we, and these organs produce the same phenomena. Behold the dog; the nerves from his brain communicate with the five senses, and put them *en rapport* with the exterior world. Light acts on his eyes, sound on his ears, taste on his palate; and thence result sensations and images which determine action. Locke and Condillac suggest no other origin for our ideas.' Becoming more metaphysical, he adds, in proof of the animal possession of sentient and thinking faculties, the following dilemma: 'Either it is not the soul which perceives, understands, considers, and wills in man; or animals, like man, have a soul which perceives, understands, considers, and wills. The two souls are of the same nature; and, served by the same organs, they receive the same sensations. Would you, then, give to animals immaterial and immortal souls?' 'Certes,' replies our authority, Q.E.D.; but he confesses it is a mystery complicated and dark in every part.

The grand problem which he proceeds to solve by his experiments is, accordingly, to separate the intellectual faculties of dogs from the intellectual faculties of men, so as to demonstrate what it is that constitutes man, and what dog. It is said comparisons are odious; but if so, M. Leonard seems inclined to think that Poodle & Co. have the best right to complain; at any rate, that his system of education can produce more moral and well-conducted dogs than the most efficient university or ragged-school instruction can turn out equally meritorious human beings. It is plainly *Pup versus Child*—literally, *Litter versus Family*, let paterfamilias think what he will of it.

But when we go into details, we find that the quadruped test does not run upon all-fours throughout. Children, for instance, are taught in schools gregariously, and example and emulation are the leading sources of their acquisitions and progress. M. Leonard takes his individual pup at from six months to a year old, and begins with feeding, walking with, and attending to it; not permitting other pups to consort with, or other persons to interfere, so as to divert its attention from its original preceptor and course of lessons—this said attention being the first, chief, and moving principle on which everything else is founded. Having secured this point, he proceeds upwards to cultivate memory, the most abundant source of ideas in animals; and, as their sensibility is purely physical, and directed, through the senses, to exterior objects, the exercises prescribed are of a nature to develop impressions produced by punishments and rewards. The dog thus treated, he states, soon learns to know what is good for him, and what is bad; what course of conduct brings him pain, and what caresses or food. He remembers, and he judges and chooses between the alternatives—of which thousands of examples might be cited—and if, adds our author, he judges, it must follow that he reasons.

With regard to instinct, whether social as in man, or individual as in beast—according to Magendie—M. Leonard observes that in the latter, among the numerous phenomena dependent upon it, we see a double end: first, the conservation of the individual; and, secondly, the conservation of the species. By a careful and continued education, holding these ruling elements in view, and directing them as is required, the possibility of greatly extending the sphere of intellect is accomplished. It is well remarked that

instinct in animals is much more developed than in civilised men, as the latter rely on intellect, which supercedes the use of the instinctive faculty; and, therefore, it is through reason that men acquire habits of instinct; and, *vice versa*, animals, by having their instincts cultivated, acquire a higher degree of intellect or reason.

Having settled the philosophy of the case, the dogs most suitable for education are, as 'justified by experience,' divided into three classes, according to the conformation of their skull. In the first class are dogs with large foreheads, and a capacious brainpan, including spaniels, barbets, pointers, terriers, and setters, all of which have pendent ears. In the second class are greyhounds and mastiffs, endowed with less intelligence than the first, their faces long, their temples closer together, and their ears only semi-pendent; and the third comprehends pugs, and the many varieties of cur and mongrel, with circumscribed skulls, and the least intelligent of their species.

Taking one of the first class as a pupil, the teacher must arm himself with untiring patience, without which nothing can be done. He must then, as already stated, adopt means to obtain the prompt and fixed attention of the dog to his motions, gestures, looks, or voice, as he uses them to indicate the something which he desires to be performed, and which is made palpable to the sense of the animal. When he fails to comprehend, punishment ought to be moderate, but frequent, and administered on the instant, as, if any space of time intervenes, there can be no trace, and consequently no comprehension, of cause and effect. The dog is shewn what is wanted, and thus exercised till he understands and obeys orders, and then he is caressed or rewarded with a favourite morsel of food; and we are informed, that though there is a general carnivorous appetite, inclining to meat verging on putrefaction, a dainty veal cutlet is the epicure viand of the canine race, which they esteem as aldermen do turtle, country bumpkins bacon, and coal-heavers heavy wet.

Dogs are no philologists, and it is a great mistake to fancy, as some do, that they understand the meaning of words. All that is needful is that they should recognise in a sound a command to perform a certain act, and, to prevent misunderstanding, it is desirable that the words should be short, and not of a description to pun upon—for example, instead of the word *assis*, 'sit down,' which may be confounded with *ici*, 'come hither,' our astute instructor calls '*sur le cul*,' and upon his tail you see the obedient neophyte at once demurely seated, and no mistake, for thereby hangs a tale of the whip or birch-twig. Of intonation, however, dogs are obviously sensible, and M. Leonard liberally finds an apology for English dogs, thought stupid in France, in consequence of their not perfectly comprehending the French accent. It might happen that Mr Grantley Berkeley's recent experience of the stupidity of French hounds might be occasioned by his faulty pronunciation of their tongue.

It is mere charlatanism in the showmen-jugglers who pretend that the dogs they choose for their tricks are more favoured by nature than others of their kind. They are usually rough spaniels (*caniches*), generally of a fair size, and having ears richly furnished with long and silky hair. In their exercises, they invariably have their heads lowered towards the ground, so that they appear to be considering the objects spread before them, whereas they are only attending to the mechanical signs to which their master has accustomed them. Taps on a snuff-box, or, better, the clink of a toothpick, or, better still, a clicking on the nails, are the means most commonly employed.

Irrespective of this particular breed, our author

selects from his first class of intellects, specimens of fine open countenance and handsome form; for dogs and *dognines* are not, in this respect, so vain of personal appearance as to be silly and affected, like human coxcombs and flirts. They are only the more sensible and instructible. Notions of beauty or of superior attractions do not turn their brain, and make them foolish in their bearing and behaviour. Indeed, no animal has any idea of grace, form, or size: a cur will bark at an elephant as pertinaciously as at a mouse; and a horse will as readily consort with a dustman's high-boned drudge, as with a duke's high-bred hunter. It is annoying to add M. Leonard's conviction that all animals fear man, and that all the stories of their attachment, having the semblance of moral action, are dressed-up fabrications or illusions. The dog of Montargis, and other similar sagacious celebrities, are but shams and impostors. He has proofs in abundance, and no end of experiments, to shew that the animal does not love his master; that he sees in him only an instrument of conservation; and if he attaches himself, it is but as the dog licking the hand about to strike him.

'The two dogs,' he says, 'which I submitted to examination by the *Instituts* of France and Belgium, and learned scientific societies of London, leaped, at my voice, from a high bridge into the river, one of them with a bit of bread in his mouth. Whilst they were swimming, I ordered the other to take it, and he did so in a moment, although I was at a considerable distance, and self-preservation in the stream must have had a powerful influence over their action.' This was certainly a striking example of obedience to command, as the result of instruction; and from what we witnessed of their 'talents,' as previously noticed, we could readily credit even more surprising evolutions of Braque and Phylax, such being the proper names of these most obedient quadruped servants. At a given order, they would come to be beaten, exhibiting at the same time signs of the utmost joy. M. Leonard called *de la gaieté* in a threatening tone, even accompanied by the lash, but nevertheless they leaped, barked, wagged their tails, pricked up their ears, and, in short, displayed every demonstration of pleasure. From such premises, he contends for the probability at least of *reflection*, as well as of *memory* and *understanding* in the animal, since, by means of a kind of formulæ, he could cause them to execute what he desired, though the command involved the most opposite conduct. Thus, he would say: *Allez vous coucher*, and in an instant arrest their impulse and bring them to his feet by the contrary 'Come hither.' Or he would, in the same manner, and with the same effect, almost instantaneously give and reverse the orders 'Be gay' and 'Be sad;' or he would put a piece of bread before Braque, saying: 'That is for Phylax;' and *vice versa*, a second bit before Phylax, with the remark that it was for Braque; and leaving them untouched during an indefinite time, the word 'Eat' (*mangez*) sent each to the morsel assigned to him, neither venturing to trespass on his neighbour's lot. This, M. Leonard observes, affords strong presumption of the intellectual faculty for which he has hazarded the term *reflection*, since, to a certain extent, it implies a combination of reasoning and comparison. We ought to state that Braque and Phylax were large handsome animals, white, with reddish-brown spots, and in shape resembling the Spanish pointer.

The well-educated dog is a wonderful physiognomist. The instinct of self-preservation, and the natural fear it inspires in man, are equally powerful in the animal, and he knows well how to read in your countenance all you approve. If he perceives in the movement of your brow the slightest indication of discontent, he is puzzled, bewildered, stupified. Raising your voice produces a like effect; and if

shewn merely for the sake of teaching, it is expedient to add some gesture which brings to recollection a preceding infliction of which he has experience. When the animal has comprehended what you want, you ought to be careful not to distract his attention; and to evince your satisfaction, and reward by a dainty, his habit of observation, which gradually diminishes his sense of fear. As the animal, like the child, is fickle, jumping from one idea to another, and happy to deliver himself from the fatigue of any long-continued strain upon his spirits (*esprit*), it is absolutely necessary to correct this fault, which would otherwise compromise the success of the best means resorted to for his instruction. In pursuing the illustration of his subject, the author mentions some curious phenomena, not uninteresting to the student of natural history. For example, he states: 'In giving myself up to the education of my two dogs, I have made an important remark, which I will set down here. When I was occupied in instructing one of them—Braque, for example—the other, Phylax, who was left to himself during the time, was notwithstanding, attentive, and appeared as if he took an interest in the lesson. When, afterwards, I undertook to teach him the matter I had been explaining to Braque, I found that he comprehended it far more readily and quickly. I fancied that I was the dupe of an illusion; but recommencing my course, I tried the experiment very many times, sometimes with Braque in the first instance, and sometimes with Phylax, but always with the same result. From this I conclude that animals are, like children, more apt to learn voluntarily what is taught to their companions, than what is directly impressed upon themselves. Thence we might believe that the instinct of imitation exists in the dog as in man, and is a useful auxiliary in the education of both; and perhaps,' he modestly adds, 'with the former as with ourselves, it may develop those potent contributors to success by giving birth to emulation and *amour propre*. In hazarding this supposition, however, I place limits on these precious qualities in animals as in all other intellectual faculties compared with those in man.' At all events, it evidently facilitates canine education to have two pupils at a time.

Although M. Leonard has defined the races among which the most intelligent or intellectual dogs are found, he allows that all are capable of some improvement, even the greyhound; respecting which he probably never heard the anecdote, that when the unfortunate Charles I. was asked which was the most pre-eminent of dog-kind, he replied the greyhound, for he has all the good-nature of the others without their fawning—a fine reproof to spaniel courtiers.

It is conceded by M. Leonard that the pretty lapdog breed of Charles II., as well as the mastiff, may be educated to a degree of intelligence which renders them very agreeable or useful—almost as much so as 'the spaniel with his eye so full of expression, or the setter, so animated in his looks and movements.' We would match the Scottish shepherd dog, in a lesser degree the English butcher-drover's uncouth-looking assistant, the cur in charge of goods on a cart in London streets, and the Skye terrier, against any of their congeners, however highly favoured by nature.

But the sagacity, as it is called, of the dog, whether instinctive or trained, has been so universally chronicled, and the tales of its wonderful manifestations so fully believed, that without denying the success of M. Leonard's curriculum, we are strongly disposed to take a more loving view of the social relations between the animal and man; resting principally, as they seem to do, on the faculties and dispositions of the former. From the days of the

scriptural Tobit to the present time, amid classic and religious miracles (from Ulysses to St Bernard), down even to the latest experiences of canine intrepidity, discernment, or affection, there is no end to the stories of the bravery, discrimination, and attachment to humanity of the dog. Was it not Argus, the dog of Ulysses—intelligent as if he had the thousand eyes of his unlucky name-father—that recognised his master on his arrival, after twenty years' absence, at Ithaca, when his fellow-creatures knew him not?

Poor, old, disguised, alone,
To all his friends, even to his queen unknown.

Forgot by all his own domestic crew,
The faithful dog alone his rightful master knew.

Him, when he saw, he rose and crawled to meet;
'Twas all he could, and fawned and kissed his feet,
Seized the dumb joy—then falling by his side,
Owned his returning lord, looked up, and died.

The St Bernard breed now patronised by Albert Smith, are, we are informed, taught how to set about their excavations in the snow; and the larger water-dogs, accustomed to drag substances from the water, will frequently, not always, include a drowning individual in their efforts to perform a usual service. M. Leonard taught his pupils to be constant in this respect, by practising them on rag-stuffed figures of men artificially convulsed, as if perishing. Of the depreciated greyhound we can vouch from personal knowledge that one stolen and carried off fifty miles in a covered cart, was no sooner liberated, than she bounded away at full speed, and in a very few hours was safe and sound at home.

But almost everybody has had, or has the familiar acquaintance of, dog-companionship, and been astonished by acts for which it was difficult, if not impossible, to account. 'Our philosopher of the objective school,' observes William Smith, the author of *Thoradale*, 'proceeding from the simpler to the more complex organisations, finds himself far advanced in the study of man, whilst as yet he is only studying the animal life around him. The unity of parts in each organic whole has struck him with admiration. In this unity or harmony of many parts lies the *oneness* of the creature. Wonderful is the dog that looks up at him with its manifest though limited intelligence. Eye and foot, nostril and throat, every limb and organ displays an admirable *consent*. He is *one*—this dog; one through the perfect harmony of powers and sensations, desire, and act. He sees you, he remembers you; he in some sort loves you; your presence, at least, gives him pleasure; he courts your caress; he has gentleness and joy, as well as anger and ferocity. He, too, perceives, remembers, and combines his memories, so as, in his limited sphere, to employ the knowledge of the past in the present emergency; but that the phrase would imply an imperfection—and he, too, is perfect in his kind—what is he less than an "arrested development" of man?'

After such descriptions as these, we may hope that it will be thought an abuse of language to speak of a ruined man having 'gone to the dogs,' or of throwing an impertinent fellow, or even physis, to the same animals, seeing that we are so nearly on an equality, and that they can find physis in the grass-field, if they need it, without a doctor. As for M. Leonard's educated specimens, we recollect playing a game at dominoes with Braque or Phylax—we forget which—his master having left the room, and what signals he might make through the wainscot being inaudible to us; but the result was, that our adversary would never permit us to put a wrong number down, and finally beat us with the apparent delight of a successful gambler!

The detail of the ways by which M. Leonard brought his pupils to such accomplishments would be uninteresting to the general reader, though some of them might probably be introduced with benefit into the training of sporting-dogs, against the cruelty of whose breaking-in, he earnestly protests, and insists on the greater perfection that could be attained by a milder mode of instruction. Yet a few of his leading rules may be noticed, and whoever likes to try the experiment, more or less completely, may witness the effect on pups of their own.

He never terrified them, especially at first, with severe punishments; on the contrary, he began with merely prohibitive displays or cracks of the whip—patience and moderation being his watchwords.

He taught them distinctly to understand their names, and pay instant attention when they were pronounced.

Rewards of caresses and meat, accompanied by words of approbation, were constantly given, as lessons were comprehended; and by degrees, only the words were retained to the entire satisfaction of dog and teacher.

Lessons were never prolonged so much as to partake of the nature of punishments, and excite lassitude and disgust.

Much depended on regular and judicious feeding. The devoted attachment of dogs to owners of the lower classes is ascribable to their frequent sharing of 'the bit and the buffet.' Even a Bill Sykes will have his faithful and ferocious associate, the ugliest of brutes, owing to this sort of treatment. At the same time, it is the brutal usage they receive from their masters, and which they endure out of their dread for them, that renders the bull-dog and other fierce crosses so savage towards strangers and all the rest of the world.

Leave to go out was requisite, and the open door and the word *liberty*, with perhaps a piece of meat thrown forth, were the signs of assent: obedience was the one thing insisted on. If it were required to teach the animal to abstain from the food, balls of the size of billiard-balls, with small spikes on their surface, were thrown at, or between the animals and the temptations, and by persevering in this line, accompanied by certain expressions, they were taught not to approach or touch meat even if left alone with them for whole nights. In issuing commands, they were ingeniously brought to attend to the terminations of the words, and not to the tone in which they were pronounced.

There are many other curious ruses and contrivances to facilitate the progress of instruction; but as we do not pretend to supply a *rade-mecum* for a complete learned education, we shall close with the author's aphorism, that 'Education forces Nature to correct itself.' Canine civilisation!

After dwelling on the value of a dog, well-taught in the degree according to the wish and pleasure of its teacher, M. Leonard draws the opposite picture of the effects of spoiling, and ignorance, and consequent disobedience, in a manner so thoroughly French, that we are tempted to copy it for the amusement of our readers.

'*Par exemple*,' he says, 'you enter the boudoir of a pretty lady, and lo! there is a villainous Shock that leaps from under the sofa, where he is keeping company with his mistress. He is not bigger than your two fists, and yet he makes more noise than the largest mastiff. He yelps at you with a sharp bark and hubbub, very disagreeable to the tympanum. "Be quiet, Bichon!" says his mistress, in a tone of voice which has nothing of the air of a command. Accordingly, Bichon takes good care not to obey. He yelps the louder. You advance into the apartment; you would pay your compliments to the fair dame;

you assume a gracious air; you throw your body into all the postures learned from your dancing-master. But Shock heeds not, and springs furiously at your legs; his noisy brawling preventing her from hearing your soothing phrases. Your gracious air is converted into a grimace, and you are obliged to stop short in the midst of your best bow! Madame laughs at your ridiculous figure. Bichon is encouraged; he shews his teeth; and if it happen that your tibiae are not well guarded, beware: you are doomed to carry off the imprint of his jaws. The pain extracts an involuntary cry. It is then resolved to recall Bichon to order. Bichon retreats under the sofa, casting an angry look at you; he receives one of those little taps which are caresses. "You are a *méchant*, Bichon. What have you done to the gentleman? Hold! there is a bit of sugar for you; and, another time, don't begin such tricks. *Allons, Bibiche*; make your peace." With such an education," observes our author severely, "a dog cannot fail to be surly and mischievous, and occasion very unpleasant scenes; all which would be avoided if he were taught promptly to obey." Perhaps we might for 'dog' read 'child!'

A NEW CALLING.

THERE are at least some novelists of our own day who possess a genuine right to their title, in having introduced a system of entertainment which would not a little have astonished their predecessors. Half a century ago, it was a subject for boasting to have read a recent book; until very lately, it was unusual for people out of literary circles to know a real live author even by sight. Now, not only have cheap editions brought the works of great living writers within the reach of everybody, but the great living writers themselves have been made cheap, and are introduced to the world in their own proper persons. There is no more marvelling now about what sort of being in the flesh may this or that rich spirit be who has dowered us with this or that immortal creation, because, if we choose, we can see him, body and breeches, once every week at least, and for the moderate charge of half-a-crown, hear him read one of his own productions. The thing will get so common soon, that there will be nothing to be said about it, nor is there novelty enough in the matter even now more than may suggest a few brief ideas.

Many of us, dead and alive, have at some time or other ardently longed to feast our eyes upon those whose writings have even whiled away a weary hour, or given to us a hearty laugh; and surely much more to look upon the thoughtful faces of those who have made us wiser and better, who have reached out to us 'the shining hand' to help us out of the slough of the world, or, at all events, to scatter flowers on the road. Now that we can do this, we may not perhaps appreciate the opportunity as we ought; and as it gets more common, we shall be doubtless less grateful still.

What would we not have given to have heard old Chaucer, 'the morning-star of song,' describe his own pilgrims on their road to Canterbury! or Spencer read to us his *Faery Queen*, which nobody (as a wicked critic has said) was ever known to read for himself from end to end! Yet a time would doubtless have come when we should have tired of both of them. How highly should we have prized an hour of the 'native wood-notes wild' of Shakespeare, warbled by 'Fancy's child' himself—a sight

of that noble brow, of those eyes that saw into the hearts of all mankind! Yet, doubtless, Queen Elizabeth and court listened, if they did listen, to his 'dramatic readings' with much equanimity and a most aristocratic lack of enthusiasm. Think what a vision of transcendent glory must blind John Milton have presented, rapt in his heavenly dreams, and uttering aloud his own immortal inspirations! And yet to those charming short-hand writers, the Misses Milton, their task became soon prosaic enough. Would it not have been grand—we are descending, but we are yet a great way up, and in noble company—to have seen Samuel Johnson, massive, ungainly, but yet not without a certain majesty, rolling forth, *pleno ore*, his *Vanity of Human Wishes*! Pleasant to have sat beneath Dr Sterne, and listened to his wilful digressions, and watched his eyes sly-twinkling over his solemn *double entendres*! And better still, to have heard Fielding reading aloud, and relishing as he read, the woes of his own Partridge, the triumphs of his own spoiled favourite, Tom Jones! Our descendants, be sure, will envy us the having seen and heard the Fielding of to-day—the biographer of the Bliss of our own times, Mr Barnes Newcome the younger—at his lecturer's desk. Mrs Blimber would have died happy, she thought, could she but have seen Cicero in his retirement at Tusculum. How many of our children, nay, as we believe, of our great-great-grandchildren, will envy us the having seen and heard that man who gave us Mrs Blimber, and a hundred other ladies and gentlemen with whom we have a very real acquaintance; envy us, especially, the having witnessed his impersonation of Mrs Blimber's favourite, and the favourite of us all, little Paul Dombey! child, who more than all other fictitious children, has touched the universal heart of England. We ourselves remember travelling in a city cab to the Bank, in company with a director of the same, with an old London lawyer, and with a copy of that number of *Dombey and Son* that contains the account of the death of little Paul, which, as we read it aloud, drew tears from Pluto's eyes (and Plutus's), caused both the lawyer and the banker to weep. Over such a pair of unsympathising folks, in such a vehicle and on such an errand, sure never was the victory of genius more complete. Consider, then, how much greater must be her power when her rightful owner is wielding his own weapon in his own hand! Who can forbear to weep for Tiny Tim, when he himself who created Tiny Tim is weeping with us? Who but must despise, and yet must pity, the iron Scrouge, when he who drew him himself exhibits the portrait, and marks out so unerringly the cruel lines upon the brow, and the place where the lines are in mercy smoothed away! Hail to this new-born art, we say, and success to the beginners of it! What matters it, that a hundred imitators, miserables, whose stock-in-trade is, not ideas, but a couple of candles, and somebody else's book, have started up and overrun the land. For our parts, we only wish that the example of our novelists were followed by our poets, of which, as we understand, there is some likelihood; that they would lend the music of their voice, and the illustration of their inspired looks—as they were wont to do in the golden age—to their own verses; and that it might be permitted to us, for instance, to hear the deep-voiced laureate pour forth 'his hollow oes and aas' in his own *Mort d'Arthur*, like

Noise of battle rolled
Among the mountains by the winter sea.

BALLAD OF DARNICK TOWER.

THE correspondent of a Scotch newspaper lately brought forward the following little grotesque ballad, with an inquiry as to the authorship and the circumstances referred to:

The devil sat in Darnick Tower,
Out of a shot-hole keekit he;
He saw Jamie Leitch come ower the brig,
To storm his batterie.

Quoth he: 'Lang have I tarried here,
And thought for ever to remain,
Since I was driven frae Galashiels,
Which lang I'd doomed to be my ain.

'But now farewell to Eildon Hills,
Farewell to Darnick Tower and tree,
For in the reach o' Jamie Leitch
There is nae dwelling-place for me.'

Wi' that the devil's ta'en a flight,
And ower the Tweed essayed to flee;
But Jamie caught him by the rump,
And he has dippit Auld Clootie.

Darnick, it must be understood, is a little village about three miles from Galashiels, and an equal distance from Abbotsford, the poetical laird of which was extremely anxious to add it to his domains on account of the above-mentioned old tower. A gentleman sent the following answer to the inquiry in the newspaper: 'In those remote times, as we all know, when witchcraft and sorcery held possession of the minds of the people, it was customary, as in the case of Soules, Michael Scott, and others, to attribute Satanic agency to men secluded in old towers, and possessed of more than ordinary energy and knowledge. The Heltons, lairds of Darnick (see *Tales of the Borders*, vol. vii.), were great fighters, as old Watt Scott knew to his cost. Their crest was a bull's head, armed, which, according to the custom of the times, was prominent on the keystone of the portal. The character of the old laird at the time of the ascendancy of Angus was "deevillish" enough to make him a good representative of "Clootie;" and the horned head looking through a shot-hole would help the ballad-monger to his metaphor. As for "wee Jamie Leitch," he might be some noted borderer who had joined Hertford when he burned Darnick Tower in September 1546, and whom Helton eyed with a true border feeling through a loophole—the act being very well represented by the head and horns of the crest on the walls.'

Now, the fact is, that the verses were written by a person recently living, and are simply a *jeu d'esprit* on a fellow-townsmen of their author, who had adopted a habit of preaching in his native village, and who, not content with his mission in that home-field, was finally ambitious enough to extend his ministrations to the equally benighted hamlet of Darnick. We put it to our readers, Could there be a better example of the conjectural history indulged in by antiquaries where nothing is known, than the above answer to the newspaper inquiry?

David Thomson, the writer of the verses, has a place in Lockhart's *Memoirs of Sir Walter Scott*, as the person who always wrote the poetical invitations to 'the Sherra' to come to the Galashiels annual dinner. He was a cloth-manufacturer, a simple-hearted worthy man, with a great fund of natural humour, which doubtless Sir Walter failed not to appreciate. 'Hogg came to breakfast this morning,' says Scott in his diary, 12th December 1825, 'and brought for his companion the Galashiels bard, David Thomson, as to a meeting of *his Tweeddale poets*.' The late Thomas Tegg, who was a relation of Thomson, was taken by him to Abbotsford, and introduced as the publisher of *Joheby*; which the prudent bibliophile thought rather daring on his friend's part. However, Sir Walter merely remarked: 'The more jokes the better,' and gave him a very kind reception.

ARTIFICIAL DIAMONDS.

Another progressive step towards the possibility of creating diamonds by a chemical process has been realised in the fact that sapphires have been so produced. M. Gaudin has communicated to the Academy of Sciences, Paris, a process for obtaining alumina—the clay which yields the new metal called aluminum—in transparent crystals, which therefore present the same chemical composition as the natural stone known under the name of sapphire. To obtain them, he lines a common crucible with a coating of lamp-black, and introduces into it equal proportions of alum and sulphate of potash, reduced to a powder and calcined. He then exposes it for fifteen minutes to the fire of a common forge. The crucible is then allowed to cool, and on breaking it, the surface of the lamp-black coating is found covered with numerous brilliant points, composed of sulphuret of potassium, enveloping the crystals of alumina obtained, or, in other words, real sapphires or corundum. The size of the crystals is large in proportion to the mass operated upon; those obtained by M. Gaudin are about a millimetre, or 3-100ths of an inch in diameter, and half a millimetre in height. They are so hard that they have been found to be preferable to rubies for the purposes of watch-making. It is thus that chemistry, by pursuing the recognised course of natural causes, will in its operation achieve similar results, and produce the diamond.—*Willis's Current Notes*.

THE PATH THROUGH THE CORN.

WAVE and bright in the summer air—
Like a quiet sea when the wind blows fair,
And its roughest breath has scarcely curled
The green highway to an unknown world—
Soft whispers passing from shore to shore,
Like a heart content—yet desiring more;
Who feels forlorn,
Wandering thus on the path through the corn?

A short space since, and the dead leaves lay
Corrupting under the hedgerow gray;
Nor hum of insect, nor voice of bird
O'er the desolate field was ever heard;
Only at eve the pallid snow
Blushed rose-red in the red sun-glow:
Till, one blest morn,
Shot up into life the young green corn.

Small and feeble, slender and pale,
It bent its head to the winter gale,
Hearkened the wren's soft note of cheer,
Scarcely believing spring was near;
Saw chestnuts bud out, and champions blow,
And daisies mimic the vanished snow,
Where it was born,
On either side of the path through the corn.

The corn—the corn—the beautiful corn,
Rising wonderful, morn by morn,
First, scarce as high as a fairy's wand,
Then, just in reach of a child's wee hand,
Then growing, growing—tall, green, and strong,
With the voice of the harvest in its song,
While in fond scorn
The lark out-carols the murmuring corn.

O strange, sweet path, formed day by day,
How, when, and wherefore—tongue cannot say,
No more than of life's strange paths we know
Whither they lead us, or why we go,
Or whether our eyes shall ever see
The wheat in the ear, or the fruit on the tree.
Yet—who is forlorn?
Heaven, that watered the furrows, will ripen the corn.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 236.

SATURDAY, JULY 10, 1858.

PRICE 1½d.

MOTHERS-IN-LAW.

Is a recent discussion on the subject, it was suggested as an argument in favour of a man's marrying his deceased wife's sister, that in such a case he would have but one mother-in-law. The general laugh which greeted this remark, proved how strong is the prejudice against that luckless relationship, upon which has been immemorially expended all the sarcasm of the keen-witted, all the pointless abuse of the dull.

Dare any bold writer, taking the injured and unpopular side, venture a few words in defence of the mother-in-law?

Unfortunate individual! the very name presents her, in her received character, to the mental eye. A lady, stout, loud-voiced, domineering; or thin, snappish, small, but fierce; prone to worrying and lamenting. Either so overpoweringly genteel and grand, that 'my son's wife,' poor little body, shrinks into a trembling nobody by her own fireside; or so vulgar, that 'my daughter's 'usband' finds it necessary politely to ignore her, as she does her h's and her grammar.

These two characters, slightly varied, constitute the prominent idea current of a mother-in-law. How it originated is difficult to account for; and why a lady, regarded as harmless enough until her children marry, should immediately after that event be at once elevated to such a painful pedestal of disagreeableness.

Books, perhaps, may be a little to blame for this, as in the matter of step-mothers—of whom we may have somewhat to say anon—and surely that author is to blame, who, by inventing an unpleasant generalised portrait, brings under opprobrium a whole class. Thus Thackeray may have done more harm than he was aware of to many a young couple who find 'the old people' rather trying, as old folks will be, by his admirably painted, horrible, but happily exceptional character of *Mrs Mackenzie*. He does not reflect that his sweet little silly *Rosie*, as well as the much injured wives among these indignant young couples, might in time have grown up to be themselves mothers-in-law.

But that is quite another affair. Mrs Henry, weeping angry tears over her little Harry, because the feeding and nurturing of that charming child has been impertinently interfered with by Henry's mother, never looks forward to a day when she herself might naturally feel some anxiety over the bringing up of Harry's eldest born. Mr Jones, beginning to fear that Mrs Jones's maternal parent haunts his house a good deal, and has far too strong an influence over dear Cecilia, never considers how

highly indignant he should feel if Mrs Jones and himself were to be grudged hospitality by missy's future spouse—little, laughing, fondling missy, whom he somehow cannot bear to think of parting with, at any time, to any husband whatsoever; nay, is conscious that should the hour and the man ever arrive, papa's first impulse towards the hapless young gentleman would be a strong desire to kick him down stairs.

Thus, as the very foundation of a right judgment in this, as in most other questions, it is necessary to put one's self mentally on the obnoxious side.

Few will deny that the crisis in parenthood when its immediate duties are ceasing, and however sufficient its pleasures are to the elders, they are no longer so to the youngsters, already beginning to find the nest too small, to plume their wings, and desire to fly—must be a very trying time for all parents. Bitter exceedingly to the many whose wedlock has turned out less happy than it promised, and between whom the chief bond that remains is the children. Nor without its pain even to the most united couple, who, through all the full years of family cares and delights, have had resolution enough to anticipate the quiet empty years, when, all the young ones having gone away, they two must once more be content solely with one another. Happy indeed that father and mother whose conjugal love has so kept its prior place that they are not afraid even of this—the peaceful, shadowy time before they both pass away into the deeper peace of eternity.

Nevertheless, the first assumption of their new position is difficult. Young wives do not sufficiently consider how very hard it must be for a fond mother to lose, at once and for ever, her office as primary agent in her son's welfare, if not his happiness; to give him over to a young lady, whom perhaps she has seen very little of, and that little is not too satisfactory. For young people in love will be selfish and foolish, and neglectful of old ties in favour of the new; and almost every young man, prior to his marriage, contrives, without meaning it, to wound his own relations in a thousand insignificant things, every one of which is reflected back upon his unlucky betrothed, producing an involuntary jealousy, a tenaciousness about small slights, a cruel quick-sightedness over petty faults. All this is bitterly hard for the poor young stranger in the family; unless, having strength and self-control enough to remember that 'a good son makes a good husband,' she uses all her influence, even in courting-days, to keep him firm to his affection and duty. Also, her own claim being, although the higher and closer, the newer, the more

dearly she loves him, the more careful she will be, by no over-intrusion of rights sufficiently obvious, to jar against the rights or wound the feelings of others who love him—especially his mother, who has loved him all her life.

Surely this fact alone ought to make any young woman, generously and faithfully attached to her husband, feel a peculiar tenderness towards the woman who bore him, nursed him, cherished him—if a woman in any way tolerable or worthy of love. Even if not, her disagreeableness ought to be viewed more leniently than those of other people. She must have had so much to bear with—as the younger generation will find out when the third generation arrives. Nay, the common cares and sufferings of mere maternity might well be sufficient, in another mother's eyes, to constitute an unalienable claim of respect, due from herself towards 'grandmamma.'

'But,' says the incredulous reader, 'this is a purely ideal view of the subject. Practically, what can you do with the old lady who comes worrying you in your domestic affairs, criticising your housekeeping, dictating to you about the management of your nursery, finally cutting you to the heart by hinting that you don't take half care enough of "that poor dear fellow, who never looks so well as he did before he was married."'

Yes, poor dear girl! it must be owned you have a good deal to bear on your side also.

Daughters and sons-in-law being always expected to be perfect—the daughter or son by blood being of course naturally so in the parental eyes—causes of necessity a few painful disenchantments on the part of the mother-in-law. She forgets that she must take her share of the difficulties which are sure to arise, so long as human beings are a little less than angels, and earth is not a domestic paradise. She had best early reconcile herself to the truth—painful, yet just and natural—that she has no longer the first right to her child. When once a young pair are married, parents, as well as relatives and friends, must leave them to make the best of one another. They two are bound together indissolubly, and no interference of a third party can ever mend what is irremediable; while even in things remediable, any strong external influence is quite as likely to do harm as good.

A wife, be she ever so young, ignorant, or foolish, must be sole mistress in her husband's house, and not even her own parents or his have any business to interfere with her, more than by an occasional opinion, or a bit of affectionate counsel, which is often better not given till asked for.

And in the strangeness, the frequent solitude, the countless difficulties of newly married life, no doubt this advice would be eagerly sought for, had it not been overmuch intruded at first. A girl, taken out of her large, merry family, to spend long, lonely days in an unfamiliar house, be it ever so dear; or entering, inexperienced, upon all sorts of family cares, would frequently be thankful to her very heart for the wisdom and kindness of a new mother, if only the mother had early taken pains to win that confidence which, to be given, requires winning. For neither love nor trust comes by instinct; and in most of these connections by marriage, where the very fact of strangers being suddenly brought together, and desired to like one another, obstinately inclines them

the other way—this love and trust, if long in coming, frequently never comes at all. Very civil may be the outward relations of the parties, but heart-warmth is not there. It is always 'my husband's family'—not 'my family'; my 'daughter's husband'; or 'my son's wife'—never 'my son' and 'my daughter'. The loving patriarchal union, which both sides, elder and younger, ought at least to strive to attain, becomes first doubtful, then hopeless, then impossible.

One secret, original cause of this is, the faculty most people have of seeing their rights a great deal clearer than their duties. About these 'rights' there are always clouds rising; and one of the prominent causes of disunion is often that which ought to be the very bond of union—the grandchildren.

Now, if a woman has a right on earth, it certainly is to the management of her own children. She would not be half a woman if in that matter she submitted to anybody's advice or opinion contrary to her own; or if in all things concerning that undoubted possession, 'my baby,' she were not as fierce as a tigress, and as hard as a rock. One could forgive her any rebellion or indignation at unwarrantable interference from her mother-in-law, or even her own mother. And with justice; for if she have any common sense at all, she may, with less experience, have as clear practical judgment as grandmamma, whose wisdom belongs to a past generation, and whose memory may not be quite accurate as to the times when she was young. Yet if the daughter-in-law has any right feeling, she will always listen patiently, and be grateful and yielding to the stress of her power. Nay, there will spring up a new sympathy between her and the old lady, to whom every new baby-face may bring back a whole lot of long-alumbersing recollections—children grown up and gone away, children undutiful or estranged—or, lastly, little children's graves. The most untold and trying of mothers-in-law is a slight reverence and touching, as she sits with 'the baby' across her knees, gossiping about 'our children' of forty years ago.

But, speaking of rights, the wife has limits even to hers. Surely the 'primal elder curse' must rest upon the woman who voluntarily or thoughtlessly tries to sow division between her husband and his own flesh and blood—above all, between him and his mother. And putting aside the sin of it, what a poor, jealous coward must she be—how weak in her own love, how distrustful of him, who fears lest any influence under heaven—least of all those holy, maternal ties which are formed by heaven—should come between her and the man who has chosen her for his wife—his very other self; and whom, if he be at all a good man, he never will think of comparing or making a rival with any other; because she is not another—she is himself.

On the other hand, a man who, however low in station or personally distasteful may be his wife's relations, tries to wear her from them, exacting for himself her sole and particular devotion, to the breaking of the secondary bonds, of which the husband ought to make both husband and wife only more tenacious and more tender—such a one is grievously to blame. People may laugh at, and sympathise with, the unfortunate victim of 'Mother-in-law Spite'; but he is certainly a more respectable personage than the 'gentleman' who, driving in his carriage with his wife and son, passes an old woman—the boy's grandmother, crawling wearily along the hot dusty road—passes her without recognition. Or the other gentleman—living respectably, even handsomely—who takes

a deal of benevolent pains to solicit among his friends and acquaintance votes for admission to an almshouse for—though he does not exactly call her so—'my wife's mother.'

It is a curious fact, subversive of the theories of novelists, that mothers-in-law of sons generally 'get on' with them far better than with their daughters-in-law. While it is no unfrequent thing to see instances of a man's being kindly, even affectionately attached to his wife's mother, and she to him—almost any of us could count on our fingers the cases we know where a daughter-in-law is really a daughter to her parents by marriage. Some cause for this is the difference of sex: no man and woman in any relation of life, except the conjugal one, being ever thrown together so wholly and so intimately as to discover one another's weak points in the manner women do. Consequently, one rarely hears of a lady being at daggers-drawing with her father-in-law. She is usually on the civillest, friendliest terms with him; and he often takes in her a pride and pleasure truly paternal. For truly, women who are charming to men are common enough: a far safer test of true beauty of character is it that a woman should be admired and loved by women. It would save half the family squabbles of a generation, if the young wives would bestow a modicum of the pains they once took to please their lovers, in trying to be attractive to their mothers-in-law.

But the husband himself has often much to answer for. When with the blindness and selfish pride of possession natural to a man—and a man in love—he brings his new idol into his old home, and expects all the family to fall down and worship her, why, they naturally object to so doing. They cannot be expected to see her with his eyes. They may think her a very nice girl, a very likeable girl, and if left alone would probably become extremely fond of her in time, in a rational way; but every instinctive obstinacy of human nature revolts from compelled adoration. Heaven forbid that a man should not love, honour, and cherish his own wife, and take her part against all assaulters, if needful, be they of his own flesh and blood; but one of the greatest injuries a man can possibly do his wife is to be always exacting for her more love than she has had time to win—always shewing her forth as a picture of perfection, while common eyes see her only as an ordinary woman, blest with the virtues and faults which women can so quickly detect in one another. The kindest, wisest, most dignified course for any young husband on bringing his wife home is to leave her there, trusting her to make her way, and take her own rightful position, by her own honourable deserts.

A man has ordinarily little time or inclination to quarrel with his mother-in-law. The thousand little irritations constantly occurring between women who do not suit one another, yet are trying hard to keep on good terms for appearance' or duty's sake, are ridiculous trifles which he cannot understand at all. Better he should not. Better the wife should keep her little troubles to herself, and be thankful that on his side he is well disposed to be tolerant towards grand-mamma. Grandmamma, on her part, not unfrequently likes her son-in-law extremely, asks his advice, is proud of his success in life; and though thinking, of course, that he is not quite good enough for her darling child—as indeed the Angel Gabriel and the Admirable Crichton rolled into one scarcely would have been—still she has a very considerable amount of respect for him, and kindly feeling towards him.

If she has not, and shews her want of it, she is the unkindest, most dangerous mother that any married woman can be afflicted with. If by word or insinuation she tries to divide those whom God has joined

together, if she is so mad as to believe she shall benefit her daughter by degrading her daughter's husband—truly this mother-in-law, cherishing a dislike upon unjust grounds, deserves any retribution that may reach her. Even for just cause, such an antipathy is a fatal thing.

And here we come to one of the most painful phases of this subject, one of the sharpest agonies that woman's nature can endure—that is, when a mother-in-law has to see her child, son or daughter, unworthily mated, forced to wear out life, to die a slow daily death, in the despair of that greatest curse upon earth, an ill-assorted marriage.

One can conceive, in such a case, the motherly heart being stung into direst hatred for the cause of such misery—nay, bursting at times into the rage of a wild beast compelled to witness the torture of its young. This mother-passion, as helpless as hopeless, must be, of its kind, distinct from any other human wretchedness; and under its goading almost any outbreak of indignation or abhorrence would be comprehensible—nay, pardonable. To have to sit still, and see a heartless woman tormenting the life out of one's own beloved son, for whom nothing was too noble and precious; or a brutal husband breaking the heart of a tender daughter, to whom, ere her marriage, no living creature ever said a harsh or unkind word—this must be terrible indeed to bear. And yet it has to be borne, again and again. God comfort these unhappy mothers-in-law! Their sufferings are sharp enough to make amends for the wickedness of a hundred *Mrs Mackenzies*.

Yet until the last limit, the only safe course for them is to endure, and help their children to endure. Cases do arise, and a wise legislature has lately provided for them, when righteousness itself demands the dissolution of an unrighteous marriage; when a man is justified before heaven and earth in putting away his wife; and the counsel, 'Let not the wife depart from her husband,' is rendered nugatory by circumstances which entail sacrifices greater than any woman has a right to make, even to her husband. Every one must have known such instances, where the law of divorce becomes as sacred and necessary as that of marriage. But such melancholy unions are, thank God, the exception, not the rule, in this our land, and form no justification for the machinations of bad mothers-in-law. Therefore let them, in all minor troubles, practise patience, courage, hope. If, according to the apostle, who wrote on the subject with that wide calm observation which sometimes seizes on a truth more clearly than does one-sided experience—the unbelieving husband may be converted by the believing wife, and *vice versa*, who knows but that a harsh husband, a neglectful wife, may sometimes be won over to better things, by the quiet dignity, the forbearance, the unceasing loving-kindness, of a good, generous mother-in-law?

Let us take her in one last phase in her long life—it must have been a sufficiently long one—and these few words concerning her are ended.

There arrives oftentimes a season when the sharpest, most intolerable mother-in-law becomes harmless; when a chair by the fireside, or a bed-ridden station in some far-away room, constitutes the sole dominion from which she can exercise even the show of rule or interference. Thence, the only change probable or desirable will be to a narrower pillow, where the gray head is laid down in peace, and all the acerbities, infirmities, or fatuities of old age are buried tenderly out of sight, under the green turf that covers 'dear grandmamma.'

Then, and afterwards, blessed are those sons and daughters, by blood or marriage, who, during her lifetime, so acted towards her that her death lays upon them no burden of bitter remembrance. And

blessed is she who, living, lived so that her memory is hallowed by all her children alike, and who is remembered by them only as 'mother'—never, even in name, as 'mother-in-law.'

A TREE OF LIBERTY.

GUINES is a dull town in the north of France, about seven miles from Calais; and needs much to enliven it. It was on a Sunday afternoon, in December 1848, that I ran into a small apartment, shouting out: 'Tom! my lad, let us off to Ardres. Come along. The elections are on to-day, I hear, and all goes in favour of Napoleon. Vive la République!'

France in 1848! What pleasing recollections, what happy thoughts crowd upon me whenever I revert to the days I passed in La Belle France throughout that memorable year. Happy, I say, for I was a Briton, though a young one—left without control for the first time in my life, with a moderate amount of pocket-money, and a good deal of assurance. I was about eighteen years of age—had blue eyes and a fair complexion; and having, from a lad, imbibed a certain taste for raw beef and porridge, was pretty muscular, and exceedingly fond of fun. It will, therefore, be seen at once, when I say that a kind papa had sent me to France to learn the language in a short time, and nothing but the language, that he couldn't have sent me to a better place. Young as I was, however, I was almost involuntarily driven into politics.

The Tom I addressed above, was an English youth of about my own age, but a great deal more bulldoggy, and a terrible cracker of cocoa-nuts, as he termed Frenchmen's heads: a friend after my own heart. He was in Guines to learn to *parlez-vous*. Arcades ambo! With him all went jollily. Beef-steaks and home were well-nigh forgotten—never repined after. Together we sung *Scots wha hae*, and *Old England shall weather the Storm*; and more than once have we silenced the cabaret chant of *Guerre aux Anglais* with a broadside of *Rule Britannia*, or *Tippitwicket*. Where Tom went, I went; what I did, Tom did, and, *entre nous*, for a long time very little progress was made in French.

Tom was delighted with my proposition, and it was agreed that we should call for old B—, to accompany us. Off we started, and upon crossing the Place, came as usual upon Henri, moustache, long sword, cornered hat, and all complete. He shewed his dirty teeth as usual—for he had vowed vengeance on us—like a vicious horse, such as not even a Rarey could tame. Henri was the commissary's head man, and an inveterate and undisguised hater of all and everything English, the folks of which nation he was continually looking up, and making them understand the true nature of a *procès-verbal*. His red moustache was so gummed and twisted, that it stuck out at right angles with his small turned-up nose, a distance of three inches on either side. He got up this forked appendage, he said, to keep in awe all *mauvais sujets*. A 'ha, ha, ha!' from Tom as he passed, annoyed him; and he twirled one end of his facial cross-bar, and looked from under his shaggy eyebrows, as much as to say: 'I'll nail you yet, my chicks.'

We found old B— indulging in a cigar, and sipping strong coffee and cognac. 'Will you go Baron?' 'Ve! ve! Quite à votre service.'

Who was old B—? Now, I cannot tell you, nor could any one I ever met tell me. He couldn't, or wouldn't, tell himself. This is all I know: he was a pompous, jolly, crafty, good-tempered, very poor professor of ten languages, but teaching only one—his own—German, which I was told he couldn't spell. He *was*, however, a baron; he would always

stick to that. It is very desirable I should dwell somewhat on the merits and demerits of old B—. My narrative requires it. Old B— demands it.

He was a podgy, short-legged man, of about five-and-fifty, who got himself up for thirty or five-and-thirty, on Sundays and gala-days. He wore a wig, a broad-brimmed white hat, and a snuffy moustache; was very upright, and had all the appearance of a live baron, especially when supported by his gold eye-glass and immense diamond brooch, his tightly strapped blue inexpressibles of chess-board pattern, his small pointed-toed patent boots, and well-fitting swallow-tailed dress-coat of a greenish hue.

His appearance was certainly *distingué*; but the most curious thing was, no one ever remembered the baron to have been dressed differently. This had been his gala-dress from time immemorial—when in prosperous times he lost his thousands at *rouge et noir* in Paris; the garments, perhaps, he condescended to wear when he dined tête-à-tête with the President of the United States, and those in which the Patagonians, or some other onians of South America, desired to crown him their king. His coat, like himself, never grew threadbare, nor his yards either. He had captivated an English countess, and often related, to our immense satisfaction, how in consequence he was forced to fly from England; he had drunk tea in China, and flirted with the maidens of Otaheite; in short, he was the wonder and delight of all who met him, and he *did* look a real baron, although his brilliants were paste, and he had been a valet. This singular old person, strange as it may appear, nearly brought me to the hulks. This was the way it happened.

Rapidly did we leave Guines, passing the English ironworks to our left, ascending the hill, flanked by its double row of trees, until we stood on memorable ground. We crossed the Field of the Cloth of Gold. I ventured to bring old B— out on the subject, but the professor evaded my general question, and quietly answered that he didn't see anything about the scene that it should be christened by so fine a name. The baron seemed colder than usual. Tom tried politics, but it was of no use; I had to come back to the old subjects. *Les jolis bleus yeux! Vive la bagatelle!* The right chord was struck; the baron yawned and yawned away, and kept us in a roar, and on we went, determined to be jolly for that evening.

An hour's walk brought us within view of the ancient—once strongly fortified—pretty little town of Ardres, where many a battle had been fought, to be fought over and over again; and where we English made our last stand in France—to be eventually kicked out altogether. Now, a six-pounder would bring the whole place down. Yet there is the fosse, the portcullis, and long arched gateway with its ponderous doors and rusty irons: the fosse is dry, the walls are crumbling—all is decay.

There resides here one remarkable Englishman—remarkable, because he ought to have been hanged fifty years ago, and is himself of the same opinion. He is a wiry little man, upwards of a century old, and receives a pension from the French government for having sold Nelson in the Mediterranean. He was intrusted, it appears, with some important dispatches and other documents from Nelson, which he ran off with, and delivered into Bonaparte's hands. Exiled, a handsome pension ever since has been his reward. He was wont to allude strangely to the plunder of Malta. I once asked him how he felt, when he heard afterwards of the affair in Aboukir Bay. Tears started to his gray eyes, and a blank passed over his weather-beaten face. He invariably spoke well of old Albion, and I fancy there was a great longing within him to visit once again his native land. This old traitor lives at Ardres.

Through the famous long archway, we entered the town, and found all bustle and excitement. Flags were flying and drums tattooing. Some were discussing, under the influence of long pipes and shrugged-up shoulders, the glories of *La Belle France*; while others marched in a row, bawling out the *Marseillaise*. Cries of 'Vive Napoleon' resounded from the old ramparts. The town was full, gay, and happy.

'Suppose we seek Monsieur H——,' I said; 'we can then have a four game at billiards. He must have put up near at hand.'

'*A la bonne heure*,' rejoined the baron; 'I will go hunt him out myself. I know well he will come.' Pointing to a particular house, he marched off in his usual dashing style, saying as he left us: 'You will enter it, and wait for us. *Au revoir*!'

Through clouds of tobacco-smoke, innumerable dominoes and cards, and all kinds of noises and smells, we entered the *café*. The rapid clack of the billiard-balls was to be heard amid the incessant jingling of glasses and the clattering hubbub which Frenchmen alone can make. But now they had assembled to uphold the glorious privilege of wholesale liberty and universal suffrage. How, then, could there be less excitement? If a sinister-looking fellow had followed us from the time we first came into the town, and continued to track old B——'s steps from *café* to *café* in his search for H——, what of it? The baron was always an attraction. Monsieur H—— could not be found. 'N'importe! I will take you a game,' said the baron, examining a cue. 'It is a good table. Allons!' We continued to play upwards of an hour. I made some excellent canons; but the baron was, beyond doubt, the great gun of the room. Tired of play, we sat down at a small side-table over our cigars and grog, and placidly examined the motley groups around us. This was enjoyment. *Vive la France*.

More than another hour had flown by when we thought of returning; but lo! what meant that eager gaze of the outdoor population? There was no necessity to think even, for a fellow in a blouse came quickly up and told us we were discovered, and must be off. *Qu'est ce que c'est*? Ha! we were detected and foiled. We were political—spies direct from Paris to tamper with the voters. *Oui, il n'y connaît personne*. *Ils viennent de Paris*—oui.

The fact was—however incredible it may appear—the good people of *Ardres* had really and positively been led away, by the baron's distinguished manners and appearance, to imagine that we had come to their town to interfere with the voting.

Half-a-dozen fellows, armed with stout sticks, were deputed to shew us the way out, and give us a sound drubbing into the bargain.

Upon leaving the *café*, we were roughly collared. Here Tom floored his man; the baron remonstrated and the brooch sparkled: but it was of no avail: we were spied, and off we should pack.

They dragged us through the town, and with kicks and cuffs sent us flying homeward under a heavy volley of stones from all the gamins of the place.

O Liberty! Liberty! 'It's your absurdly *déagé* manner that's done it all, baron,' I cried. 'But what shall we do?' again I shrieked, for I was in a towering passion. 'Fight? Nonsense. Pocket the affront? No—I will have revenge!'

'Revenge!' echoed Tom. 'I will punch the first Frenchman's head I come across; but, I say, that was a good un on Crapaud's figure-head. My knuckle's cut.'

'Parbleu, my pack is cut too. Diable, we will go to the *préfet*. Oh, my coat is ruined—my hat is smashed.' Thus lamented old B——

In quite a different spirit from that in which we

had set out, we trudged homeward: I plotting vengeance—but what I didn't know; Tom intending to fight the first opportunity. The baron did nothing but eye his ruined coat and battered-in chapeau.

Upon entering *Guines*, old B—— parted hurriedly from us. Tom and I continued our way very dejectedly, and were crossing the Place, when, lo! vengeance was in my grasp; all, all was clear as noonday—we could shock the whole nation in its nicest point. My mind was relieved.

'Tom,' said I, with startling earnestness, looking him straight in the face, and clapping one hand on his shoulder, while with the other I pointed in the direction of the *Hôtel de Ville*—'Tom, we will cut down that tree of humbug.'

'Bravo, bravissimo!' shouted Tom.

'Hush!' I resumed. 'Come to my apartment to-morrow, and we will concoct our plans.'

'That tree is doomed. *Bon soir*.'

We met next evening, and, for the benefit of future historians, and guidance of all would-be plotters, I will explain how we purposed to carry out our desperate resolves.

'I have,' I began, 'thought over the whole matter, and see no great obstacle to the attainment of our wishes, provided we can overcome the first that presents itself. We must get a saw, and that so cleverly, that not a soul must even dream of such a thing. How is it to be done? Now, look ye here, Tom,' I continued: 'you know little W—— at the ironworks better than I; call upon him to-morrow—keep your eyes open for the tool-house—you will fall over abundance of saws there—unobserved, clap one up your back, button your coat, bid little W—— adieu, and hasten here to me.'

'Very pretty; to be nailed stealing a saw; no, no! hit upon something better than that.'

'Tom,' I answered quickly, 'I have pondered over the affair all night and to-day, and this is the only feasible plan I see; besides, if you are detected, it was a wager, you understand, and we must let our project fall to the ground.'

'Fall, yes; the tree must fall: all right—I'll get the saw.'

'Tom, you're a brick.'

Here, cigar in mouth, he threw himself into a chair, cocked his legs on the mantel-piece, and folded his arms, while I proceeded.

'The saw obtained, we must choose a dark night, and issue out of the house, about two o'clock, by the front-parlour window; for, by that time, we shall probably find Henri asleep.'

'Well,' rejoined my companion, 's'pose t'other—s'pose Henri finds us awake?—his carbine is loaded.'

'What, the white feather, Tom?'

'O dear, no; I should think not—go ahead: we shall only be shot down by Redspikes, or have a little quiet recreation for five or ten years in the hulks—capital opportunity to arrive at a thorough knowledge of the idioms of the language. I never shall speak French if I don't do something—so down with the humbugging tree, and the sooner the better.'

We settled upon the following Friday.

The inhabitants of *Guines* were justly proud of their emblem, as three attempts had been made, and had failed, to transplant a suitable poplar to its consecrated space on the Place, just before the *Hôtel de Ville*, before they possessed the 'largest and finest Tree of Liberty in the whole of France.' They dug about it and dunged it, placed a pretty tricolored painted wooden railing round its enclosure, and bid Henri guard it with his most zealous care, ay, with his life.

By Friday, it was known that Napoleon had gained the presidency. *Guines* was said to have favoured Cavaignac.

'Tom, all right. Come along, are you ready? It

rains in torrents, and the wind is awfully high—so much the better? Yes—shut your door. Hush! hark! Tread gently down this corridor—mind that step: c'est le premier pas qui crie!

I had brought Tom to my room, as arranged. As the clock struck two, we buttoned up our old coats to the neck, fastened thick towels round our heads, tied on our slippers, and glided softly down a short flight of stairs into the parlour, where the window was soon opened, and the green blinds outside thrown back.

With palpitating hearts, we looked out upon the darkness. What a night! The rain fell, and the wind howled fiercely through the deserted streets. The prospect was anything but inviting, and I must own I began to feel my courage oozing away like that of Bob Acres's, when Tom very cleverly dropped into the street below, and called on me to follow. In the open air my pluck revived, and we had taken only a few steps forward, when—bang, bang.

'What on earth is that row? It will rouse the whole place. It's only a loose half of the blind flapping against the wall. Quick, on to my back; you must close and tie it. Leave the window open.'

Again we stealthily glided away along the most secluded thoroughfares, now and then stopping to listen for an unwelcome footstep; but nothing was to be heard save the roaring wind and pelting rain. We reached the Place unmolested, and strained our eyes towards the Hôtel de Ville. We gained the door; another pause; good—Redspikes was asleep.

'To work.'

A few hasty strides brought us to the object of our vengeance. The saw is drawn, Tom's arm is stretched.

'Diablo!' he whispered, 'I can't reach the tree. We are done—these cursed rails. Shall we get over?'

'No, escape were then impossible. By Liberty, we won't be done,' said I, placing my shoulder firmly against the fence-work. 'Now for your weight, Tom.' One, two, three. Ugh—crack went the wood-work; and in another minute we were in the enclosure, and hard at work.

Sawing to windward, we had wellnigh brought the monster low, when we heard footsteps approaching; and we had to lie down flat by the side of our victim till the unconscious individual had passed away. Soaked to the skin, we rose and resumed our task, and soon had the satisfaction to find the tree give. Another vigorous essay, and it cracked; then placing a round stone in the incision made by the saw, which opened wider and wider with every succeeding gust of wind, we prepared to leave the spot.

'Do you think she'll go?' said Tom.

'Depend on it, she'll go now with the first heavy squall; she'll go, but we'll wait the issue yonder at the corner. Sharp's the word. By Jove, she's off!'

I had barely uttered these words, when the ponderous tree fell with a roar, smashing through the fence-work that surrounded it. The noise was a fearful one to be heard in the middle of such a night. We had scarcely reached a sheltering position, a few yards off, when up flew a dozen windows, and out flew Henri, carbine in hand.

'Qui va là?' No reply.

He stood still a moment, then dropped his head as in the act of listening. We suffered an agonising suspense. Just then a door slammed violently in the opposite direction to where we lay ensconced, and off we bounded. We had escaped. It was the work of a few minutes only to regain the parlour, fasten up the blinds and window, and creep quietly into bed.

Next morning, the town was in an uproar. Telegraphs were at work—so was poor Henri. Louis Nap. was furious—so was poor Henri. The authorities had the impudence—sheer thoughtless

impertinence—to interfere with my appetite for a whole month, by quartering a dozen blood-thirsty gendarmes in a court-yard right facing our *salle à manger*. But, however, in spite of awful moustache and Napoleonic messages; in spite of the tales of Cherie, the maid, who archly hinted at dirty marks on the window-sill; in spite of the model they got made from the foot-prints found in the enclosure; in spite of more than one hundred examinations before the *préfet*—all they proved was, that Henri had been fast asleep, and the saw 'used by an experienced hand.'

THE NORTHUMBERLAND HOUSEHOLD BOOK; OR, HOUSEKEEPING THREE HUNDRED YEARS AGO.

PART II.—CONCLUSION.

HAVING catalogued the eatables of three hundred years ago, we now turn to the wines; the yearly order for which we find to be '10 tons, 2 hogheads of Gascoigne wyne—namely, 3 tons of red wyne, 5 tons of clarett, and 2 tons, 2 hogheads, of whyte wyne,' at L.4, 13s. 4d. the tun. The earl seems to have retained the tastes of his Norman ancestors for the fair wines of France; but we would fain have known whether generous port, then so little popular with the English, was ever admitted to his board, or whether sherry, immortalised by Shakspeare some half-century later under its other name of sack, had yet found its way into the cellars of Wresil; but on these points the *Household Book* is silent, nor is there mention made of any kind of spirits. Beer was the principal beverage of the household, and to discover the cheapest method of manufacturing it, seems to have cost the earl and his council some anxious days, if not sleepless nights, for we find the most minute calculations entered into on the subject.

We are able to collect from these pages the names of a large variety of birds, which, though now lightly esteemed, were, in those days, introduced as luxuries at the tables of the great; thus, it is thought good that sea-gulls be had for my lord's mess, and some other, if they be in season. Wypes (or lapwings), stints, redshanks, bitterns, curlews, with many more equally strange, or equally distasteful to us as articles of food, are mentioned with similar restrictions, and seem to have been placed side by side with partridges, pheasants, snipes, and wood-cocks; even larks are set down as a delicacy not to be unreservedly enjoyed. Swans and peacocks were in high favour, and a warrant, drawn up as formally as if it related to the conveyance of all the estates of all the Percies, authorises the bailiff of his lordship's manor of Leckingsfield, to 'deliver to my well-beloved servants, Richard Gowge, controller of my household, and Gilbert Weldell, clerk of my keching, against the feast of Christmas next coming, 20 cygnets,' &c.

We find in this list no mention of turkeys; but had it been drawn up a few years later, they would probably have held a prominent place, for Baker in his *Chronicles* says of the fifteenth year of this reign: 'It happened that many things were now newly brought into England, whereupon this rhyme was made:

'Turkies, carps, hops, piccarell, and beere,
Came into England all in one yere.'

The *Household Book*, however, clearly proves this to be incorrect, so far as the articles of hops and beer were concerned.

Let us now take a momentary glance at the earl's breakfast-table, choosing for our visit a season when all good Catholics are supposed to eschew a too great attention to creature comforts; and, first, we miss the now almost indispensable luxuries of tea and coffee, for which, to modern tastes, the 'quart of beyre and the quart of wyne' are but rude substitutes; but there is the goodly loaf of trencher (brown) bread, the two manchets, made of delicate wheaten flour, 'the dysch of butter, and the pece of salt-fish, or dysch of buttered eggs,' the latter to be replaced on flesh-days by half a chine of mutton or a chine of beef boiled: no great stint after all!

My lord and lady's fast-day dinner consisted of several varieties of fish, such as 'turbot slyced or baked, a dysch of flounders, a dysch of fried smelts, with salmon, sprotts, and salt-fish, five manchets, a pottell of beyre, and a pottell of wyne;' to this was added for them that had the 'reversion'—that is to say, those who waited and took the leavings—'three lofes of bred, and three pottells of beyre.'

It will be remarked that there is here no mention of vegetables: potatoes, peas and beans, were then unknown in England; but that others were at least occasionally introduced, may be gathered from a subsequent order, that 'from heretoforth there be no herbes bought, seeing that the cooks may have them anewe in my lord's garden;' and in the list of the servants we find a 'gardener for setting of herbes, cheppinge of knots, and sweepynge the garden cleane.'

Similar minute directions are given for the 'ordcrynge' of the boards of my lord's children and those of his various dependents; and we observe a gradual decrease in the scale of luxury as we approach the lower offices, the 'dyshe of fresh fish, and the dyshe of cod or lyng, with butter, bread, and beyre,' dealt out to the head servants, being exchanged in the latter case for a 'pece of salt-fish' only.

We have no bill of fare of any of the 'principal feasts;' but, from the variety of choice viands laid in for them, they seem to have been conducted on the most liberal and magnificent scale; indeed, no one who studies this *Household Book* can for a moment doubt that boundless hospitality reigned throughout the princely establishment of the Percy; but it is as a domestic economist we are now chiefly considering him; and of his pre-eminence in that character, almost every page furnishes many, and sometimes amusing examples: thus, we find him on one occasion, always of course with the help of 'his council,' taking a review of the operations of the past year, and gravely noting down such defects as the following, 'in order that the provision thereof be amendit yerely from henceforth:' 'That there be no white salt occupied in my lord's hous, without it be for the pantre, or for castynge upon meat or for seasonynge of meat; that, whereas mustarde hath been bought of the sauce-maker aforetime, that now it be made within my lord's hous, and that one be provided to be groom of the squellery that can make it; that there be no lambes bought when they be at the darrest, without it be for my lord's boorde, the chamberlayne meas, and the stewardest meas; and that whereas earthlyn pots be bowght, that ledder pots be bowght for them for serveynge for lyveries and meales in my lord's hous.'

These are a few of many equally important matters that engaged the attention of one who, in early life, had directed the movements of an army, and who had yet to stand side by side with his royal master on the memorable 'Field of the Cloth of Gold.'

In looking through these pages, we catch an occasional glimpse of some of the sports and diversions of the era to which they refer.

Shooting with the long-bow, once so much practised by the English both as a means of defence and a favourite exercise, seems about this time to have fallen into some disrepute; for, during the reign of Henry VIII., acts of parliament were passed, rendering it compulsory for every man under sixty, except spiritual men and justices, to have a bow and arrows constantly in his house, and also that every servant should possess a bow and four arrows, master providing the same, and stopping the purchase-money out of his wages. In spite, however, of these stringent laws, we find good old Latimer constrained a few years later to lift up his powerful voice in behalf of an act which he designates as 'God's instrument, whereby He hath given us many victories against our enemies,' and which, he moreover adds, is 'a wholesome kind of exercise, and much commended in physic.' But that the use of the long-bow, however unfashionable elsewhere, was still practised at Wresil, is evident from the sum 'payde yerely to my lord's bowyer for seyinge and dressynge all his lordship's bowes in the yoman of the bowes keeping from tyme to tyme, and also to the flecher for seyinge to all the shaft arrowes and all others—he to fynde,' it is added with characteristic precision, 'all feders, waxe, glawe, and silke.'

Christmas in the olden time was, as is well known, a season of almost unbounded mirth and hilarity: in the houses of the great especially, Folly, with his cap and bell, seemed for the moment to reign paramount; and we are not therefore surprised to find a *reward*, as it is here styled, given yearly to 'an Abbot of Misrewele:' this being doubtless, as the editor suggests, the same respectable personage who, after the Reformation, when the word abbot had acquired an ill sound, reappeared as the '*Lord of Misrule*,' to preside over the Christmas gambols in the houses of our chief nobility. A master of the revels was also appointed for 'overseeing and orderynge the plays, interludes, and dressynge that is played before my lord on the twelfth day after Christmas.'

The drama seems to have been the favourite amusement; and Scriptural subjects, not excepting those even which involve the deepest and most awful mysteries of the Christian faith, were chosen as vehicles for the display of dramatic action or pantomimic skill. The priests were not only the authors of these religious plays, but in most cases the actors also. We have already heard of my lord's clerical almoner distinguishing himself as a playwright, and we now find others of the same holy calling 'playing a play at Shrovetide,' and again 'playing the play of Resurrection upon Easter-day in the morning in my lord's chapel.'

Minstrels of various degrees of merit, dependent apparently upon the rank of their masters—for an 'erle mynstrelle,' we observe, was to receive more than a lord's—are noted down amongst the regular recipients of his lordship's bounty; in return for, or more probably in anticipation of which, some of their fraternity were always to be found playing at my lord's chamber-door, and those of his family and guests, as soon as day dawned on New Year's morning.

In the administration of his charities, the Earl of

Northumberland proved himself a good Catholic, for he lavished what must then have been considerable sums in gifts to the church; and though we, whose lot has fallen on more enlightened times, may feel inclined to smile at the misappropriation of some of them, we must not forget at the same time to do justice to the liberality of the hand that knew how to scatter its wealth in so many and such diverse directions.

The shrine of our Lady in the Whitefriars at Doncaster seems to have been particularly favoured by the earl, being mentioned here as his own foundation. Both it and the prior who presided over it enjoyed a large share of his patronage. But he also assisted in 'upholdynge the lytes of waxe which his lordship fyndeth burnynge yerely before our Lady of Walsingham, Sainte Margaret, in Lincolnshire, and the holy blood of Hailes'—this last being a pretended relic of the blood of our Saviour, brought from the Holy Land by the Earl of Cornwall in the reign of Henry III., and by him deposited in the monastery of Hailes in Gloucestershire.

Several very ancient, and, as we suppose, now obsolete popish ceremonies are here alluded to, amongst others that of 'creeping (so) the cross on Good Friday,' which act of corporeal debasement the good earl and countess and their children diligently performed.

On Maundy Thursday, the custom, still kept up by the sovereign, of relieving as many poor people as the benefactor is years old, was strictly observed in the castle of Wresil: gowns, shirts, wooden trenchers loaded with bread, 'eaten cups' filled with wine, leathern purses containing pence equal in number to the years attained by the donor, were freely dealt round. One of the items thus alluded to is curious:

'That my lord caus to be bowghte on Maundy Thursday 3½ yards of brode violett clothe, for a gowne for his lordship to do service in, and to be furrede with blake lambe, which gowne my lord weareth all the tyme his lordship doeth service; and after he hath done his service, at his sayd Maundy, doth gyf to the poorest man that he fyndeth, as he thynketh among them all.'

On New Year's-day, there was a general interchange of gifts between the various members and inmates of the family; and rewards were dealt out to those of the domestics who were so fortunate as to be chosen to convey them; but the exact amount to be given to each was carefully written down; nothing was to be left to caprice, nothing to impulse:

'My lord useth and accustomed to gyf yerely to the servant of my lady, his daughter, the little Lady Margaret aforesaid, now a staid matron, and the wife of the Lord Clifford, if she be on New-year's Day with his lordship, and send him a New-year's gyft, 6s. 8d.'

The removal from place to place of a household such as that we have been describing must have been, under any circumstances, rather a serious affair; and considering that it was customary to remove a large portion, if not the whole, of the household furniture, we almost wonder that it could ever have been attempted more than once or twice in a lifetime. The usual mode of travelling for gentlemen was on horseback; while the ladies either rode on a pillion behind them, or singly on their own palfreys, which they exchanged, when fatigued, or in bad weather, for a covered litter. We find, however, several kinds of carriages mentioned, such as horse-litters, chairs, close 'carres,' chariots, and carts; but some of these bore small resemblance to the vehicles so named in the present day; the chariot, for instance, must have been a sort of wagon, as is evident from the load assigned to it in the general order for the removal of the family, and also from seven 'great trotting horses' being appointed to draw it, and a chariotman, on a

smaller nag, to ride beside them. More than two horses had never yet been used for carriages, commonly so called; and it was reserved for the proud and luxurious George Villiers, Duke of Buckingham, some fifty years later, to astonish the worthy citizens of London, by appearing in the streets in a coach drawn by six horses.

Still, whatever form it might assume, the chariot took precedence of all the other conveyances employed, and seems on these occasions to have been put to an unaccustomed use, for certain officers were charged 'yerely, before the remewal of my lord at Michaelmas, to see all the vestry stuf, and the wardrobe stuf, carried by my lord's own chariot to the place appointed; because my lord shall be put to no further charge of carriages than needeth, seeing that the carriage, with my lord's own chariot, may save the same, and the stuf begone at least a fortnight before his remewal.'

If his lordship travelled unaccompanied by his family, six horses were required for himself and suite, as thus: 'A nagge for him to ryde upon; a second, to be led for him to change; a third, for the groom of the robes to ride afore with his maile; two others, for clothes-sacks, containing his lordship's bedde and body apparail; and, lastly, one for the groom of the livery to ride afore, with the shavynge basin and ewer.'

All hail to the days of railways, and carpet-bags of diminished state, but added comfort, when an overland journey to India occasions less trouble, and occupies not much more time than was once expended in a transit between London and York. Well, though, might the ex-coachman of a nobleman, transformed into his lodgekeeper, remark lately to a friend of ours, while deploring the loss of that golden harvest which had often deposited a sovereign in his pocket in return for washing a visitor's carriage: 'Why, bless you, sir, now-a-days the first lord in the land may walk in at that gate, with his bag and wrapper under his arm, and nobody know that he is a lord.' And what matter, say we:

The rank is but the guinea's stamp;
The man's the godd for a' that.

It must now suffice that we give a few more extracts, taken almost at random, further to illustrate the prudence and foresight by which the framers of this curious book were characterised, and first—

'It is ordayned that whoever stands charged with the expenses and keepynge of my lord's hous for the yere, shall at all such tymes as my lord doth excede in the sayre of his hous the ordinary service accustomed as appointed in his book of orders, as well as all feasts as in tymes that strangers cum, brynge my lord a bill of the names of such (articles) of flesh or fish which is expended above the ordinary sayre, and in what service it is expendit, that his lordship may dayly see at such tymes as strangers be with him, wherein he doth excee the sayre ordinary of his hous.'

'Item, that the clarkes of the keching shall after they make any bargaine for any manner of provision for keepynge of my lord's hous, that they make him privy thereto, afore the bargayne be concluded, to the intent that they may know whether his lordship agrees to the said price or not.'

'Item, that the clarkes of the brevements (or registrar), by the advice of the controuller and head clarkes of the keching, cause the catorer to go abroad in the country weekly for bying of stuf in such places as is thought it shall be *best cheap*; and to by it seldomeat where my lord liveth, except it may be had as good cheap there as elsewhere.'

'Item, it is thought good that all manner of wyld-fowl be bought at the first hand, and a catorer to be appointed for the same, for it is thought that the

poultrers of Hemmingburgh and Clef hath taken great advantage of my lord yerely, of sellynge of cuneys and wyldfowl.'

But the Lord of Northumberland was not easily imposed upon, and we should think there was marvellously little danger of the evil befalling him which he thus guards against.

'That the clarks of the kechinges see that the service appointed in the booke of directions for the expenses of my lord's hous be observed and kept without imbridgement, to be examined every day what lacks thereof, to the intent that the officers shall not perluine it to their profit, if there be any, but that it remayne only to my lord's profit.'

The Lord of Wresil was not, it would appear, the only nobleman who, after distinguishing himself at the court and in the field, retired to his country-house, there to relax his energies by paying a minute attention to domestic affairs; for we find among the notes in the *Household Book*, an article entitled 'Lord Fairfax's orders for the servants of his household' after the civil wars. And at the risk of trying the patience of our readers, we must give two or three extracts from it, for the edification of modern housewives, no less than to shew the gradual progress of refinement as we approach nearer to our own times.

After appointing the servants to assemble by seven of the clock in the morning in the hall, he requires the 'clarks' of the kitchen to direct the cooks what shall be for breakfast for the ladies in their chambers, and likewise for the gentlemen in the hall or parlour, which must be served by eight o'clock, and not after.

Dinner was to be ready by eleven—quite an advance in civilisation this—and the great chamber being duly served, the steward and chaplain were to sit down in the hall, and call to them the gentlemen, if there were any unplaced above, and then the servants of the strangers, as *their masters be in degree*; and if any unworthy fellow do unmannerly sit himself down before his betters, they must take him up and place him lower! With a regard to appearances scarcely to be surpassed by the most aspiring of modern *parvenus*, it is next provided that 'the best fashioned and appparelled servants shall attend above the salt, the rest below;' and they are, moreover, instructed, that if one have occasion to speak to another about the service at table, let him whisper, 'for noyse is uncivil; and if any servant go forth of the chamber for anything, let him make haste, and see that no more than two be absent.

'For prevention of errands, let all sauces be ready at the door, for even a mess of mustard will take a man's attendance from the table; but, lest anything happen unexpectedly, let a boy stand within the chamber-door for errands.

'Let no man fill beyre or wyne but the cupboard-keeper, who must make choice of his glasses and cups for the company, and not fill them hand over head. He must also know which be for beyre, and which for wyne, for it were a foul thing to mix the two together.

'Let him which doth order the table be the last man in the room to see that nothing be left behinde that should be taken away.' And then his lordship thus concludes: 'Many things I cannot remember, which I refer to your good care; otherwise I should seem to write a book herEOF.'

And now we, too, must take our leave of this curious memento of days long gone by: we have culled only a few of its more prominent passages, in presenting which to the readers, we have purposely passed over many equally or even more curious; the correct signification of which, from the obscurity of the diction and the obsolete customs referred to, seems to be difficult to come at. If we should have succeeded in affording half an hour's

amusement to those who may not have leisure or opportunity to examine it for themselves, the time we have devoted to the study of the Northumberland *Household Book* will not have been spent in vain.

LITERARY RECOLLECTIONS.

THIRTY years ago, we remember Mr Cyrus Redding as a youngish man, of gentlemanly appearance and address, fond of society, and qualified by his manners and conversation to take a prominent part in it. This, together with his literary tastes and capabilities, is sufficient to account for the contents of the book before us; by which we find that the author, in his progress through life, mixed much with the world, and possessed opportunities of seeing a good deal both before and behind the curtain. The present result is more a book of personal anecdotes than an autobiography; and the public appear to have applauded his judgment in making it so, for already we have the second edition of the work.*

Our author tells us that he was dandled on the knee of Howard the philanthropist, and that he saw Lord North, although unable now to recollect either. John Wesley he both saw and heard in childhood. 'A servant taking me out to walk, I saw him in a black gown, his long white hair over his shoulders, as in his portraits, at which I stared as at something wonderful. Children were clambering on the timbers, close to where I stood. On a sudden, he stopped in his discourse, turned round towards them, and called out in a clear, loud tone: "Come down, you boys, or be quiet." Another divine of eminence in America, called Murray, he likewise remembers; the same who received from his countrymen the sobriquet of Salvation Murray, to distinguish him from another of the same name styled Damnation Murray. Franklin preferred the doctrine of the former, remarking, that 'it was more natural than otherwise that God should reconcile a lapsed world to himself.'

When Mr Redding had seen, as he tells us, 'a score of summers,' he set out for London, and in due time—19 hours to 84 miles!—arrived at Bath, and found it realise the descriptions we read in obsolete novels. The pump-room was too small for the crowd of fashion, and almost every house exhibited a hatching. Quin called Bath 'the finest place in the world for an old cock to go to roost in.' Its merits, however, were more various, for it was choked up by the *beau-monde*, who rushed thither to drink water and to dance, as well as to die.

'Among the distinguished individuals then in Bath, were William Pitt, and the overshadowed Lord Melville; the latter under the cloud of his impeachment. Pitt was rapidly sinking. The battle of Ansterlitz, and defeat of the last coalition, pressed him to the earth. His desire was to be like his father, a great war-minister, without the experience and due appreciation of the difference of circumstances and times. His stamina were gone; Bath did him no good. Two or three bottles of wine a day ceased to stimulate, and he had constant recourse to large doses of laudanum.

'An official, in attendance at the House of Commons, used to be ready with a full beaker of port-wine when Pitt arrived. This he quaffed off nearly to the quantity of a pint before he entered. He would repeat the draught in the course of the evening. I have at this time a friend who knew the official, proud of relating the circumstance. The reaction of such a custom was inevitable. Care about self-esteem did not keep him politically honest. Did the consciousness of it lead him to wine, or was it

* *Fifty Years' Recollections, Literary and Personal, with Observations on Men and Things.* By Cyrus Redding. 3 volumes. London: Charles J. Skeet. 1858.

pure love of the beverage? Perhaps it was neither—a stimulant had become necessary to a feeble stomach. His father was fond of port wine, and took it despite the gout.

'The sight of Pitt's person was not calculated to strengthen his cause with his youthful advocate, for such I was then. His countenance, forbidding and arrogant, was repellent of affection, and not made to be loved, full of disdain, of self-will, and, as a whole, destitute of massiveness; his forehead alone was lofty and good. He walked with his nose elevated in the air; premature age was stamped upon his haggard features. . . . As I recollect, he seemed nearly as tall as myself—in flesh, the merest scarecrow, which, perhaps, made him seem taller than he really was, having, by the use of alcohol, attenuated the muscular fibre.'

It was later than this our author found Gravesend 'a miserable little place,' where he was charged five shillings for a biscuit and a glass of spirits and water. A companion, disapproving of the exorbitant profit, smashed stealthily half-a-dozen glasses on the sideboard.

Mr Redding's acquaintance with the author of *Lacon*, who is mentioned repeatedly throughout the book, commenced in this wise:

'I was sitting alone expecting a summons to dinner one day, when the door of the room opened, and, with little ceremony, a hard pallid-faced gentleman in black entered, and began:

"I have heard of you, sir; wished much to be acquainted; came from Tiverton; called to ask if you had seen one of my pamphlets," handing over one; "singular thing, sir."

"Pray, sir, whom have I the honour of addressing?"

"My name, sir, is the Reverend Caleb Colton, Cambridge Fellow, curate of Tiverton."

"Pray, sir, take a seat." Here commenced my acquaintance with that singular personage, the author of *Lacon*. A first-rate scholar and shrewd thinker; most superstitious about spiritual appearances. His pamphlet related to the Sampford ghost, and most extraordinary things he stated as facts, and verbally re-affirmed. He talked of the church, of Horace, of his own poetry, of which he had a lofty idea, and of Dr Johnson's opinion of spirits. In vain was dinner announced; he took no hint, and, being pleased with his conversation, I thought the best way was to ask him to take a share of what awaited myself. He jumped at the offer, and said it would prolong conversation. I remember there were ducks on the table, and that he dined off a very small portion of one of them. Of wine, no dean, "orthodox in port," could seem fonder in moderation. It was midnight before he departed. His conversation was scholastic and clever, mingled with the wonders of the ghost. He had sat up two nights, had found the bells of the house rung, had undone the wires, and still the mysterious sounds were heard. He had rushed with a light into the apartment, and counted five or six vibrations of a clapper while he looked on. He had listened to footsteps on the stairs, where nothing could be seen, and had been so convinced of supernatural agency, that he had made himself responsible for two hundred pounds, to be paid to the poor of the parish, if the thing should be proved an imposture. This was a great proof of his sincerity, as no man loved money more. It may be observed, that he was so credulous about ghosts, he would not walk home of an evening across his own churchyard, unless he was lighted by some one, and a little girl of ten years of age used to accompany him on such occasions, carrying a lantern. He gave me a pressing invitation to Tiverton, and quoted many lines from a poem he was composing, called *Hypocrisis*.

"Now," said he, "do you think any lines of Pope are more euphonical than these?"

'His conceit at first surprised me, but seeing his weak side, I flattered him.

"Really they are good, and very like"—

"There, sir, I think these will convince you I can write verses of some merit."

'His repetition was like a boy declaiming at a grammar-school; upon all other topics he was shrewd, informing, and agreeable. He laid bare a sophistry admirably, and when he felt he had succeeded, he indicated it by a peculiar twinkle from the corners of his cunning gray eyes, bespeaking his satisfaction. His cheek-bones were high, and his features denoted none of that intellectual power which he undoubtedly possessed, rather the result of labour than genius. He seemed in conversation as though his whole life had been devoted to controversial debate, and that he had employed all his time in detecting fallacies. His learning was great, his reading extensive, his memory retentive. He quoted from English, Greek, and Latin writers with great facility, when he wanted to illustrate any subject. His knowledge of the Scripture was apt and profound, yet he was careless in morals, selfish, reckless in conduct, and sceptical in his faith.'

Mr Redding was, of course, disappointed with the appearance of Madame de Staël; who, however, was 'not ugly, but simply uninteresting and ordinary in feature, and somewhat heavy and rather full in person.' The conversational talents of this remarkable woman are well known; but the practical distinction she drew between the English and German characters, in reply to a question of Mr Redding, is as acute and as true as anything of hers we have seen. 'Asking her what she thought of the Germans, she replied in some respects they were mystics, fond of the extravagant, because their rulers left them little else with which they could deal freely. They were not always exact reasoners, but that was an inconvenience under their circumstances which political amelioration would remove. They were baptised in theories, but might still put to shame the logical English, who spoke continually of Locke and reason, and obeyed custom. "You do not take the trouble to test the soundness of your customs. The Germans are only at liberty to dream, but cannot act on their dreams."

The conversation of Dr Wolcot at seventy-seven years of age was as racy as ever. As a physician, he seems to have been born a generation before his time. He outraged both the faculty and the people by permitting his fever patients to drink as much cold water as they pleased; he affronted and dismayed the apothecaries by analysing their medicines; and he said to Mr Redding with his heretical candour: 'A physician can do little more than watch nature; and if he sees her inclined to go right, give her a shove on the back.' When Wolcot was in Jamaica, the governor's sister asked him the news one morning, and he 'told her that a cherub had been caught up in the Blue Mountains, and brought into the town.

"What did they do with it, my dear doctor?"

"Put it in a cage with a parrot."

"And what then, doctor?"

"In the morning, the parrot had pecked out both its eyes."

"You don't say so!"

Wolcot was the first patron of Opie, whom he brought forward in a very judicious manner. The young artist began with heads at 5s., which increased to 10s. 6d.; and on returning, after his first painting expedition, with twenty guineas in his possession, 'so wonderful was the sum in his unaccustomed eyes, that he first flung the money on the doctor's table in a sort of rapture, and then sweeping the coin all off upon the carpet, rolled himself over it, exclaiming: "Here I be rolling in gold!"'

Among Mr Redding's acquaintance was Catala,

whom he found 'always the same elegant and amiable creature, with the same sweet simple smile, and modest manners.' Through another acquaintance, an old lady, less known, he heard of some of the celebrities of a former generation. "Charles Churchill," she observed, "nobody could ever dream he was able to write such fine poetry, who knew him as well as I did. He was such a heavy, dull man, and had so little to say in company. He often dined with my father, and had a great name with the players." Wilkes, she told me, generally came to her father's house with Churchill, and had all the conversation, having something to say to everybody and about everything, but he was so ugly. . . . I found that Mrs Kendal, for that was Miss Cotes's name by marriage, did not think much of her father's friend as a gentleman, though as a poet, she said, she said, was full of his praises.'

Among the originals in this amusing cabinet, not the least interesting is M. Mentelle, a French mathematician. He was a handsome man of four or five and thirty, who lived in a summer-house in a garden—a glazed room about ten feet square—which he occupied free of cost, giving a half-crown lesson once a week to supply himself with food: 'I entered his cell, occupied by himself and his books, nearly to repletion, together with a long box or chest, in which were several blankets, and across it a plank, on which he was sitting, his feet and legs in the box for the sake of warmth, his back against the wall which received the sashes on both sides, some of which had a pane or two fractured, and mended with paper, on which I observed closely written Greek characters. Before him was a tilted board, which served him for a table, and by the side of the box, an old arm-chair, on which several folio volumes lay open, one upon another. From the ceiling, suspended by a rusty wire, just over his primitive table, hung a piece of tin-plate bent into the form of a lamp, with a wick and oil in it. A small can stood in one corner, and in another, an earthen pitcher of water.' This gentleman conversed fluently in Greek, Latin, English, Italian, German, and Arabic; and read various other tongues, including Chinese. He had travelled on foot all over the continent. 'He was on intimate terms with the members of the French Institute, and the principal men of science in Paris; and a curious figure he cut walking with some of them arm in arm in a soiled flannel jacket and trousers, without stockings, through the fashionable Boulevards, as was often the case.' Mr Redding strongly advised the philosopher to abandon his cherished idea of coming to England, where poverty is only not as great a crime as robbery. 'Your innocent sleep by the wood-side would be deemed a crime. The *juge de paix* would send you to prison for that alone, and, if money were found upon you, it would aggravate the offence. He would ask why you did not get a bed, if you were an honest man. He would say you were a beggar, or were hunting game. Your knowledge, if displayed, would be treated as an aggravation of your offence, "for one who knew so much must be an idler, who would not work for his bread." Do not come to England unless you have money, and a good coat.'

Let us now call up Foscolo; for Mr Redding, with great good taste, concerns himself only with the dead. 'Foscolo lived at Moulsey, but had a lodging in Blenheim Street. There my introduction took place to this friend of Alfieri, well known as he was throughout Europe. Foscolo, at the moment I entered the room, was under the hands of his barber, lathered to the eyes. The lower part of his face looked like the wood-cut of a monkey I had in an edition of Gay's *Fables*, when I was a boy. The upper part was fine, a good forehead, fine large gray eyes, his brow expansive, scanty sandy-coloured hair, all, however,

depreciated by the snails and napkin over his shoulders. He sputtered from his ample lips through the snowy froth: "Sit down, my good friend; I have heard of you—we will talk presently." His scraggy neck was bare, but amid all, his countenance was expressive of high genius. He was scrupulously neat in his person, and gentlemanly when he pleased. . . . His temper was his great failing; and he would too often disregard the exact truth in the relation of a fact, and thus get into a dilemma, and to get out of it, shew his quickness of feeling. . . . We used to play at chess together, when he would make a bad move, and flying into a passion with himself, tear off his hair by the handful. I therefore proposed that we should play no more, as it might lead to a personal quarrel. He said that he was sorry for it; he could not help quarrelling with himself, being so careless in his moves.' Here is a poetical portrait of Foscolo by himself:

A furrowed brow, intent and deep-sunk eyes,
Fair hair, lean cheeks, and mind and aspect bold!
The proud quick lip, where seldom smiles arise—
Bent head, and well-formed neck, breast rough and cold,
Limbs well composed; simple in dress, yet choice;
Swift or to move, act, think, or thought unfold.
Temperate, firm, kind, unused to flattery lies,
Adverse to the world, adverse to me of old;
Ofttimes alone and mournful, evermore
Most pensive, all unmoved by hope or fear;
By shame made timid, and by anger brave;
My subtle reason speaks: but ah! I rave—
'Twixt vice and virtue hardly know to steer—
Death may for me have fame and rest in store!

An amusing account is given of the indignation of a lady of the genus irritable, who was offered twelve guineas per sheet by the *New Monthly Magazine*, edited nominally by Thomas Campbell, but really by Mr Redding. 'To imagine that I should write on such terms,' wrote Miss Mitford, 'is ridiculous. I left off writing for the magazines generally because sixteen was not enough, and in my letter to Mr V— was as clear as possible on the point: I especially said six guineas an article, long or short.' These were the palmy days of the monthly magazines. How much do they pay now? The annuals, too, we remember—at least the first-class annuals—did not count the pages at all: they paid fifteen guineas per prose article. The contributions to the *Book of Beauty* were on a different footing: they were a homage to the fair editress, Lady Blessington, whose female contributors usually received an ornamental pen, or some other article of trifling value, as a return of courtesy.

Mr Redding is not an out-and-out admirer of Lamb. 'Lamb's dislike of the country, born and bred in London as he was, seems rational enough; and from the same cause, his affection for ale and tobacco, attachments worthy of those who dislike flowers, kitchen-gardens, and love company, particularly low company. Lamb felt himself at home here. He owned, notwithstanding, that he had a delicacy towards sheep-stealing. Were not the Edinburgh Reviewers right—could such a man be a poet? His charming essays came from his own habitual feelings, and the peculiarities of his social habits, and were quaint, fruitful pictures of certain things allied with those habits. Poetry is a different matter, and more universal in its nature—at least, that poetry which confers a lasting reputation. A poet born, bred, educated, and continually resident in a great city, with none but urban associations, is like a stall-bred ox that never pastured. The map of Lamb's world, and that of his followers, extended from Hampstead to Camberwell, and from Brentford to Bow. They had heard, it was true, of other countries beyond those limits, which were the sojourn of the Troglodites, whose heads grew beneath their shoulders, for all they knew or cared about

them. Porter was their nectar; the tavern-board or the book-cleared table in chambers, the fresh lobster, and the toasted cheese at supper, a little discourse on their own theories, amid the incense of the Indian weed, and they were in their element. Lamb had not seen the "wide" world. He cherished his circumscription, and he was right if he liked it best. He was a kind relative, a good but peculiar man, but had no sympathetic rejoicings with wild wanderers. He was an original, radically of the city in his habits as well as literature. The Thames was his lake, not Bala or Derwentwater; the oozy beds of the coal-lighters on the fragrant borders of their opaque waters bathed his spirit. He loved the place of his nativity, and the streets and dwellings that he had known so long. The dinginess of Fleet Street and the Temple was his precious *verd antique*. All this was natural, nor am I aware that he ever upbraided or envied those who expatiated more at large. His "sect" died with him.

If we had room, we should be glad to quote a scene between Campbell and Professor Wilson. The former was talking with warmth of the tyranny of the Czar Nicholas in tearing away Polish children from their families; and Wilson contending in grave badinage that it was all an error arising from mistranslation; that the young Poles were really young pigs.

But we must have done; and we give Mr Redding the last word: 'Horace Twiss, with his grave countenance, who should have been called single-speech, for he made but one good speech in parliament, was a sober and attentive man of business—his solemnity sometimes passing for extra wisdom. One day, going to see a friend in the Temple, I met him on the ground-floor. "Come with me," said he; "Twiss is rehearsing; don't make a noise." Horace had to be down at the house that evening. We peeped through the keyhole, hearing him in practice, and saw him address the tongs, placed upright against the bars, as "Mr Speaker;" but we could not hear all the oration. The honourable member preserved wondrous gravity, and the tongs falling, said to himself: "Ay, now the Speaker has left the chair."'

LURKING POISONS.

For years past we have been taking lessons in mistrust, and are more than half afraid of swallowing poison with our daily food. It would be well were we still more mistrustful, not only with respect to food, but to various other articles which are continually passing through our hands. Poison lurks in a thousand places and things where we do not expect to find it, and a very slight circumstance often suffices to transform what we deemed a trifle of no account, into a death-dealing agent. Even when fatal consequences actually ensue, they are frequently attributed to any cause rather than the right one, especially in cases where children are the sufferers.

It may not, perhaps, be amiss to instance a few such cases, and I do so with the view of putting persons on their guard, and inducing them to make themselves acquainted with the nature and properties of many dangerous things by which they are surrounded, and so prevent the repetition of accidents which are now, through ignorance, of frequent occurrence. Take, for example, the following:

Not many days ago, the wife of a well-to-do farmer with whom I am acquainted came to town on the market-day, leaving an infant of ten months old in the especial charge of her eldest daughter. Almost immediately after her departure, the child, a most

engaging little girl, was taken suddenly ill. Violent attacks of vomiting, between which the child lay in a kind of death-like torpor, were the symptoms, and a tooth, which was just making its appearance, was blamed as the cause of her suffering. As, however, some time elapsed, and no perceptible improvement took place in the state of the little patient, the sister became alarmed, and despatched a servant to recall the mother. On her arrival, she also set down everything to the tooth, and but for the inquiries of a friend, to whom the circumstances of poor baby's illness were pathetically detailed, the aforesaid incur would have borne the blame of having caused it.

The friend, however, could not divert herself of the idea that the child's sufferings were not the result of teething, but of some mineral poison that had been accidentally administered to it, particularly when informed, that after it had taken the breast, though the sickness was greater, the bad symptoms began to abate.

'Are you quite sure,' she asked, 'that your little one had eaten nothing injurious?'

'Quite sure,' replied the mother, almost indignant at the bare idea that her darling's sufferings had been caused by any carelessness or neglect on her part. 'Indeed,' she added, 'knowing she was about some teeth, I would not trust her to a servant, but fed her myself; and she was in no other hands except those of my daughter this morning.'

'Then had she no playthings near her?'

'Not any.'

'O no,' interposed the daughter; 'the only thing she touched was a piece of paper, and at first I thought it had made her sick, as she swallowed a bit of it, and sucked the colour off the remainder.'

The solution of the matter was now made perfectly plain. A few more questions proved the correctness of the visitor's suspicions. The paper alluded to was a large ticket of a brilliant and beautiful green colour, which had been taken off some article of clothing. Its gay hue and the glittering letters had attracted the child's attention; and the mother, never deeming such a trifle could contain anything injurious, unsuspectingly placed in the eagerly outstretched little palm a portion of a most deadly poison. Fortunately, the dose did not prove sufficient to destroy life, though it was quite strong enough to place it in jeopardy.

When paper-hangings were more expensive, and consequently less common than they are at present, the walls of two rooms in my father's house were washed with a green solution. Whenever these walls were swept, the person performing the operation was sure to complain of sickness, and an acid copper taste in the mouth. This is easily accounted for, though I believe it occurred several times before any harm attributed it to the real cause. Of course, the sweepers removed a portion of the colouring matter from the walls, in the form of a fine and subtle dust, which, being inhaled, produced slight symptoms of poisoning. Here, too, a child had nearly lost her life from repeatedly wetting her finger with saliva to rub the colouring matter off the wall.

Of a similarly injurious nature are the brilliant green-hued paper-hangings which have been so much in use of late. Only a few weeks ago, a medical man, writing to one of our leading journals, gave an account of his having suffered seriously from them. It appears from his statement, that being in the habit of spending a considerable portion of his time in a room hung with paper of the objectionable

hue, he became ill, but, removing to another apartment, he speedily recovered. Subsequently, returning to his old place and habits, the bad symptoms again appeared.

His suspicions were aroused; and certain chemical experiments proved, beyond the possibility of doubt, that a highly poisonous matter had been extracted from the green-coloured paper, and transferred to his system, by inhalation, to an extent sufficient to bring on serious indisposition.

It seems, moreover, that in one of the continental cities, the police authorities have interfered, and actually rent paper-hangings of this particular colour from the walls, to prevent the dangerous results which might have otherwise ensued to those who occupied the apartment.

It was suggested, some time ago, that the gas contained in the air-balls which have lately been such favourite toys, might, under certain circumstances, render them anything but safe articles to place in the hands of the rising generation. But it seems that here again the actual loss of two lives has resulted from the use of poisonous colouring matters in their decoration.

The sufferers were the children of a man who manufactures these air-balls; and his whole family have suffered, more or less, by inhaling the poison. For my part, I honestly rejoice at the introduction of any new and attractive plaything, deeming it no light matter to furnish a child with a source of pleasure; but surely novelty is too dearly purchased at the cost of human life.

Again, it is quite possible that a sufficient amount of poison to affect the wearer may be rubbed off a dress. A few months ago, many of the young women employed in a great Parisian dress-making establishment became suddenly ill while at their work. They were making up a number of ball-dresses, of a peculiarly beautiful and novel shade of green, and the friction indispensably attendant on their labour, had displaced a portion of the colour, which they had inhaled.

A physician of eminence, who was consulted on the occasion, gave it as his opinion, that should these dresses be worn in a ball-room, a sufficient quantity of poison would be mingled with the atmosphere to produce most dangerous consequences to the company.

These are only a few out of numerous cases which present themselves as all springing from similar causes. But they are sufficient for my present purpose, since they give ample testimony of the harm which may result from ignorance in a very simple matter, and also furnish instances of the various forms under which one poison only may be presented to us without awakening suspicion.

Take the first case quoted. All persons who have anything to do with children, well know with what avidity the youngsters beg for pieces of coloured paper. They watch eagerly for the time when the last sheets of note-paper are taken from the cover, or the envelopes from the gay band which confines them, in order to appropriate these little works of art—for truly many of them may be called such—to the manufacture of sundry devices. And probably not one mother out of a hundred is conscious that a misapplication of some of these innocent-looking and much-coveted articles might cost a child's life.

We need only ascertain of what such colouring matters are composed to see clearly the cause of such disastrous effects. The majority of greens, in fact, all the most beautiful, are preparations of copper, the only mineral which produces that colour. In Ure's *Dictionary*, we find, under the head 'green paints,' a list of seven greens, nearly all of which are different prepa-

rations of copper. Scheele's green, and Schweinfurth green, the two most beautiful pigments of this hue, are both deadly poisons. The first is composed of oxide of copper, and arsenous acid, or white oxide of arsenic. Schweinfurth green, which is a still finer colour, contains the above-named ingredients, but in different proportions, and with acetic acid in addition. With regard to the first, Dr Ure tells us that it was detected, a few years before the publication of his work, as the colouring matter of some Parisian *bonbons*, by the *Conseil de Salubrité*; since which, the confectioners were prohibited from using it by the French government. More recently, I have myself read of a case where a child was poisoned through sucking the green colour off some twelfth-cake ornaments.

Now, where so large a proportion of the various shades of green are known to be formed by a mixture of some of the most powerfully poisonous substances, and since only persons possessing considerable chemical knowledge can distinguish those that are the least injurious, it is surely advisable to caution all who are not so well informed. Even when green is produced by a mixture of blue and yellow, Prussian blue, the one most commonly employed, is in itself slightly poisonous.

Before passing from the subject of colours, I will mention a few of the poisonous substances used in producing different shades for painting and dyeing. To attempt to give the exact composition of each colour, and the mode in which it is produced, would occupy too much time and space; as it is, I only intend to name a few, simply with a view to put persons on their guard against the misapplication of articles innocent enough in their proper places, and hurtful only when, as in the case quoted at the commencement of this little paper, they are placed in the hands of those who divert them from their original uses.

Among the colouring substances used by the manufacturers of paper-hangings and painted papers, are white-lead, chrome yellow—a preparation of lead—Prussian blue, blue verditer—a preparation of copper—and the greens already mentioned. The above-named are all poisonous; and when we consider the immense number of articles wrapped in these painted papers, no more need be said as to the necessity for great care in placing them in the hands of children, since any one knows that almost everything given to a child under two years of age is carried to the mouth. Even those of larger growth are apt to do the same thing; hence the danger above alluded to.

Probably, with respect to paper-hangings, much of the mischief might be obviated by using those which are glazed; or—as it rarely happens that the whole surface is so, the opposite effects produced by dead and bright shades being considered so desirable—they might be varnished after having been hung on the walls.

But green or other coloured articles are by no means the only ones against the improper use of which a caution is necessary. In looking through the columns of a newspaper, we frequently meet with paragraphs like the following: 'A poor woman, who died lately at Bratost, near Spilsby, Lincolnshire, after a few days' illness, had incautiously applied some tallow from a candle to a scratch on her face. In a few hours after the application, her head and face became very painful, and previously to her dissolution, had swollen to a frightful extent—the consequence of some very poisonous ingredients used by chandlers for purifying tallow.' This was inserted in November 1851. In the following January, a similar case is quoted: 'A young man has died at Hull from putting tallow on a pimple on his face. The tallow contained arsenous acid, and verdigris had in consequence accumulated on the candlestick.'

Amongst the poorer classes of the community, tallow is a very favourite specific. As in the instances already mentioned, it is applied to scratches, pimples, cuts, and a hundred other trifling hurts. If a child is suffering from a cold in the head, a thousand to one but its nose will be tallowed before it goes to bed, while a tallow-plaster, applied to the chest, is considered the 'sovereign' thing on earth to relieve any oppression there, or difficulty of breathing. I once saw such an application made to a frightful burn on the breast of an infant. It produced no injurious effect, because it so happened that these candles did not contain the poisonous ingredient which is to be found in some, as all tallow is not exposed to the same bleaching process, some being simply whitened by age. Where, however, there is a quick sale, or an unusually large demand, certain substances are used to improve the colour which impart a poisonous quality.

Of course, only the initiated can tell which are harmless and which hurtful; hence the necessity for the disease of tallow as a snare; for though I have mentioned the lower classes of the community as those who make the most frequent use of it, they by no means stand alone. It is an old-fashioned and very favourite remedy even with some middle-class folk, as I can avouch from my own actual knowledge; and those with whom it is not, may do good by warning others against it. It is horrid to think of the suffering which might have been entailed on the poor child to whose burned breast a tallow-plaster was applied, had it contained the poison so many candles do.

More recently than any of the above cases, two lives have been lost in consequence of the careless exposure of certain photographic chemicals of a deadly nature.

In the first case, a photographer had left a vessel containing a poisonous solution on the sill of a window opening into a neighbour's premises. The child of the latter drank the liquid, and died.

The second case is still more to be regretted, since the case with which photographic chemicals may be procured, furnished the means of committing suicide to a girl of sixteen, who had been a couple of months in the service of the artist's mother. The unhappy young woman had deliberately carried a bottle of iodide of potassium—a substance which, on solution in a pure liquid, becomes prussic acid—to her bedroom, mixed a portion with water, and drank it. The coroner before whom the inquiry respecting the cause of death was made, strongly condemned the indiscriminate sale of such deadly articles, and recommended the interference of the legislature to prevent it. I cannot too strongly impress on the minds of those who use such dangerous substances, that the greatest care ought to be taken to prevent their falling into inexperienced hands. Probably the amateur is less likely to err in this respect than the professional photographer, since the latter, from constantly having them in hand, is apt to forget they are anything but the tools of his trade.

To add to those instances would be easy; but I will mention only one more case of poisoning from the accidental misapplication of an article in daily use. A lady who was in the habit of using what is called 'almond flavour' for culinary purposes, incautiously left the bottle containing it within reach of a child, who, naturally supposing that what mamma put into her sweet-cakes must be good, seized the phial, drank the contents, and expired instantly, from an immensely powerful dose of hydrocyanic or prussic acid.

Any comment on the above cases is needless. They speak for themselves; and should the attention drawn to them here be the means of inducing persons to make themselves acquainted with the properties of the

articles they use, and thus prevent their misapplication, the writer's purpose in collecting them will have been fulfilled.

CAMEL-EXPEDITIONS IN AMERICA.

FAMILIAR with matters of European concern, perhaps few among us are aware of the energetic efforts which the government of the United States has latterly been making to establish means of communication across the great wilderness which stretch from the borders of the Mississippi to the new American settlements on the Pacific. These efforts remind us of the almost continuous series of expeditions to lay open the coasts of the Niger and obtain a knowledge of the interior of Africa. Beginning with Lewis and Clarke, there have been numerous expeditions in the far west, all more or less successful, one of the more adventurous and interesting of these journeys being that of Colonel Fremont, an candidate for the presidency, whose achievements in opening a way across the Rocky Mountains gained for him the appellation of the Path-finder.

In pursuing these long and hazardous explorations, two chief difficulties were to be encountered—either with the tribes of Indians, and the unavailability of the ground for wheeled carriages. With their skill as strategists and marksmen, the Anglo-Americans could indeed beat off successive hosts of natives; in point of fact, what with slaughter, natural fear, and diplomatic conciliation, the Indians are not so formidable as they were even a few years ago. But the prodigious obstacles presented by nature still remain to be conquered—great trackless plains destitute of water, occasionally a broad river with shelving banks, rocky ravines, and lofty mountains. The transport of water in sufficient abundance for man and beast has, in particular, been found not more practicable than in the deserts of Arabia. Horses, bullocks, men, sank under the privations to which the want of water exposed them; and nothing more dismal can be pictured than the track pursued by several of these expeditions—the route for a thousand miles showing the bleaching bones of animals, along with the wreck of carriages and other objects which had to be abandoned by the daily diminishing force that still contrived to keep its face westward. At length it was proposed to try an expedition with the assistance of Camels, to be imported for the purpose from some place in Asia. The project, however, encountered the usual of doubt and opposition usually given to everything new and untried. It had been stated, on the authority of Father Hue, an old traveller in Turkey, that the camel cannot swim; and, strangely enough, no one could positively rebut the assertion. Now, if Father Hue was right, there was at once an end of the scheme for employing camels in America, since deep and broad rivers must be crossed in the jump across the plains. After some little debate, it was resolved to import camels and make the trial; if they would swim—and, barring their obstinate temper, why should they not?—the practicability of employing in any direction was settled.

Who does not look with some interest at the discussion of this curious problem—now solved, as we shall proceed to relate?

Nearly a hundred camels and dromedaries were imported into the United States; their place of landing being Indianola, a port in Texas, on the Gulf of Mexico. Here, being turned loose for a time to recruit after the fatigues and discomforts of their long voyage, they got into good health, and were conveyed to San Antonio, to be employed in the expedition of Lieutenant Beale and that of Captain Pope for subterranean wells in the deserts intersected by the Rio Pecos. According to the account given in a New York

newspaper,* which we chiefly draw on for what follows, Lieutenant Beale left San Antonio on the 25th of June, having selected for his expedition twenty-three camels and three dromedaries. The camels were laden with a large portion of the grain necessary for the teams of mules. Those of them which, in their native country, had been trained to this business, were found capable of carrying a thousand pounds-weight. The expedition took the route from San Antonio to El Paso, and thence up the Rio Grande to Albuquerque, at some distance west of which the new explorations were to begin. From San Antonio to Albuquerque, by this route, the distance is over a thousand miles, a large part of it through districts very scantily supplied with either grass or water. It was accomplished in forty-five days, the train moving at an average rate of four miles an hour, and the camels bearing the journey perfectly well. From Albuquerque the expedition marched to Zuni, an outlying settlement of New Mexico. Lieutenant Beale left Zuni on the 28th of August, having obtained an escort of troops from Fort Defiance, situate some ninety miles to the north in the country of the Navajos. His route lay nearly due west, along the 35th parallel of north latitude, and through a region hitherto almost unknown. As far as the Little Colorado, the road, though with volcanic ranges of mountains constantly in sight, some of them capped with snow, was comparatively level. There were abundant supplies of grass, with timber sufficient for fuel, and plenty of water. After crossing Little Colorado, which was followed for some days, and which has a wide and fertile bottom, with a fringe of cotton-wood along the banks, the expedition encountered the San Francisco mountain, having on its eastern slope great forests of pine, and on its western forests of cedar. From the western foot of this mountain the country grows more barren, till, near the banks of the Colorado, it becomes a desert, excepting the bottom lands, a few miles in extent. The river here was found to be from two or three hundred yards wide, flowing at the rate of three or four miles an hour, and with nineteen feet of water in the mid-channel. It was unobstructed by rocks, and was apparently navigable for large steamers. The inhabitants of an Indian village represented the river as maintaining the same character as at Fort Yuma, near its junction with the Gila.

Now it was to be proved whether the camel could swim—a test to which Lieutenant Beale had looked forward with not a little anxiety. Having reached the Colorado, he was determined to settle the question for himself. The first camel brought to the bank refused to enter the river; but another being brought down, to the great delight of the whole company, it took the water freely, and swam boldly across. The others, tied one behind the other in strings of five, were taken across in the same way. They not only swam with ease, but, in this particular as in others, they seemed to outdo the horses and mules. This seemed to be the only remaining test needed to establish the character of the camel as a beast of burden specially suited for those regions. Lieutenant Beale had started with the determination that the experiment should be no partial one, and he made it a point to subject his camels to trials which no other animal could stand. As to the result, he thus expresses himself:

‘In all our lateral explorations they have carried water, sometimes for more than a week, for the mules used by the men—themselves never receiving even a bucketful to one of them; they have traversed patiently with heavy packs, on these explorations, countries covered with the sharpest volcanic rock, and

yet their feet to this hour have evinced no symptom of tenderness or injury; with heavy packs they have crossed mountains, ascended and descended precipitous places where an unladen mule found it difficult to pass, even with the assistance of the rider dismounted, and carefully picking its way. I think it would be within bounds to say that, in these various lateral explorations, they have traversed nearly double the distance passed over by our mules and wagons.

‘Leaving home with all the prejudice attaching to untried experiments, and with many in our camp opposed to their use, and looking forward confidently to their failure, I believe, at this time, I may speak for every man in our party, when I say there is not one of them who would not prefer the most indifferent of our camels to four of our best mules, and I look forward hopefully to the time when they will be in general use in all parts of our country.’

The country, for eighty miles west of the Colorado, continues a sandy desert, with but little water or grass. At that distance, the expedition struck the Mojave, which there began to have some water in its bed. Crossing the San Bernardino mountain by the Cajon Pass, they reached Los Angeles on the 20th of November. This route is far preferable in every respect to that by the Gila, hitherto followed. It is especially adapted for the sheep-trade—sheep being the chief staple of New Mexico—and is likely to lead to increased trade and intercourse between New Mexico and California.

What particularly adapts the camel for use in those regions is not merely its capacity to endure fatigue and long want of water, but the very coarse and scanty food with which it is content. Those animals eat as they go along anything of a vegetable nature they find in their path, bending their long necks and throwing their heads into every narrow crevice of the rocks where grows a cactus or a clump of grass, or cropping the leaves from the branches of trees without in the least slackening their progress. In this respect, as in many others, they have a great advantage over mules or horses, which require food as regularly as man himself.—According to still later accounts, the camels were realising the best expectations which had been formed respecting them; and we can fancy that their now thoroughly proved adaptability to exploratory purposes would suggest their being employed in expeditions to the interior of the Australian continent.

TRADE IN DRINK.

The liquor-traffic-suppression law of America is proclaimed in this country to have been a failure—that is, impossible of observance, in any state where it has been tried. The reports to this effect are, however, premature; at least they do not comport well with some facts of recent occurrence. In the year 1856, two hundred women entered the liquor-stores of Rockport, Essex county, Massachusetts, and destroyed all the liquors they could find. One of the sufferers by this Jenny-Geddes movement sued Stephen Perkins and his wife, who were concerned in it, and the case was lately decided in the supreme court at Salem by Chief-justice Shaw. The defendants were absolved, on the ground that the law had declared liquors kept for sale to be a nuisance, and it was therefore lawful for any person or multitude of persons to destroy them, wherever found. A salute of ten guns was fired in honour of the decision, and many instances have since occurred both of public officers and private individuals walking into liquor-stores and deliberately smashing every vessel containing liquor which they could reach, of course without being liable to any action in consequence. In fact,

* *New York Tribune*, January 22, 1858.

liquor for sale is now, in Massachusetts, a species of property for which the law affords no protection. The lowest 'loafer' on the streets may walk into the gayest liquor-palace, and do as he likes with it.

The observance and working out of law in America is more tinged with the Lynch principle of natural justice than it is in our old and long settled country. Hence we perhaps see in the above facts a procedure which would never be sanctioned in England. Yet we would not advise the liquor interest with us to be too confident of the future. Their enemies are a small body, but they are indefatigable in their efforts to direct indignation at the public-houses—and when we see such astounding mischiefs constantly flowing from that source, can we wonder at their success? To take an isolated example: There are 2239 public-houses in Liverpool, and the habits of the working-classes in that city are thus described by a missionary (Rev. J. A. Steinthal): 'Saving is an exceptional virtue among them. . . . The great, the chief kind of wasteful expenditure is the money spent on drink. . . . It is hardly possible to conceive the sums thus uselessly and foolishly spent. . . . There is nothing which a man addicted to drink either reverences or fears. As long as the victim drinks, any attempt at moral or religious improvement is altogether hopeless. There is a general belief that intemperance is a very prevalent vice; I only wish it were more generally known how awful are its ravages, and that all persons would but see with their own eyes the ruin which it produces. I have seen fathers and mothers pledge their children's clothes for drink. . . . Until the curse of drink is removed, I have no hope of the permanent improvement of the working-classes. It is and indeed to watch the degrading and hardening influence of the desire for drink. I constantly hear of men turning their wives and children out of doors, to find refuge where they can for the night. I have seen the ruins of a man's furniture, which in drunken frenzy he had destroyed. I have seen the wife's spare garments scorched and burned by the folly of a man who wished to make his fire burn brightly. I have seen the awful horrors of delirium tremens, when a man was as effectually mad as if labouring under mental disease, which indeed, for the time, he was. It has been my lot, of late, to see the tears flow down many a mother's face, as she told me of her starving children, and yet I have known mothers spending their money at the public-house, wasting their husbands' hard-earned wages for that which is not bread. That which thus can deaden every natural affection, every appeal of duty, must be cast out from amongst us, if we are not to see greater degradations than we already deplore.'

In answer to the objection, you cannot make people sober by act of parliament, they affirm that to some extent you can. As is well known, a partially restrictive act has been in force in Scotland for some time past. The entire cases of drunken disorderliness reported by the police in the seventeen principal towns of Scotland during the three first years were 116,101, against 145,366 in the three preceding years; of such cases on Sunday there were 4299, as contrasted with 11,471.* Of there being a ratio, indeed, between the number of open public-houses and the amount of this appalling body-and-soul-destroying vice, we believe there can be no reasonable doubt.

How strange to contrast with the results of drunkenness in an industrious population the results of the providing of drink in certain cases. A recent lunacy-inquiry case reveals to us a capital in the brewing-trade advanced, in sixteen years, from £200,000 to

£600,000, enabling the fortunate trader to purchase a royal residence, to hunt in splendid style in the Highlands, to keep racers, to marry a lady of noble family, and settle on her a jointure of £15,000 a year! We suppose the enjoyers and partakers of these drink-made fortunes look on the money in Vespasian's spirit—*Non olet*. A touch of Chief-justice Shaw would, however, change their tune—and it may come!

INSTINCT.

Thou art not of my kind, nor knowest

What manner of a soul I bear,

Save by that instinct which thou shewest—

God's gift to thee, a jewel rare;

A charm by which to understand

The plying touch of this weak hand.

Like some lost human sense, to thee

It teaches what man cannot teach,

Our common nature's mystery

That lies beyond his reason's reach:

Thy quick bright eyes—so meek, so true—

Can pierce my being through and through.

I do but look on thee, and lo!

Thou'rt all one quiver of delight:

Thou seem'st, thus dancing to and fro,

Some beam of heaven's reflected light,

A flash of joy—a sportive ray,

To haunt and guide my darkened way.

What is thy need, O gentle friend!

That thou must watch me where I sit

Chasing vain shadows without end—

Nursing sick sorrow's fever fit?

Why winnest thou beside my door?

I did but cry: 'My heart is sore.'

Thou canst not heal it: go thy way.

Thou wilt not?—Nay, then rest thee here:

There's something in thy looks doth say

'To me thy chamber is not drear.'

Methinks thou'rt sent—at last, though late,

To teach me how to 'stand and wait.'

I never owned thee; nay, nor fed,

Nor taught thee tricks as illers do;

Yet constant to my side thou'rt led,

Drawn by a chain that draweth few.

Writhe as I may, in thee I find

A patience passing human kind.

What if I smote thee?—Never wince!

I would not do myself that shame.*

My soul is struck, poor friend; yet since

Revenge thou knowest not even by name,

I will go pray while strength is mine

For such a nature as is thine.

Say, did I smite, wouldst thou leap up

And touch my cheek with silent tongue?

Ay, thou wouldst drain the bitter cup,

Nor inly cry: 'My heart is stung,'

But melt my wrath with blithesome cheer,

Turning my passion to a tear.

I could not so: the more my need.

Heaven framed me with too keen a sense

Of wounds that rankle while they bleed,

And mine own helpless impotence

In this blank world that round me rolls,

Strewn with the wrecks of human souls.

Come! lay thy head upon my knee,

O gentle Teacher, wise as strong!

I'll bow me down, and learn of thee

To win by love that suffers long;

And find all rest beneath the sun

In the calm sense of duty done.

CONTRARY TO THE CUSTOMS.

I AM, for my own part, an individual of Spartan virtue and the strictest morals. If I picked up a purse of money in the street to-morrow, I am almost certain that I should advertise it in the newspapers. If I took somebody else's portmanteau home with me in place of my own, I should at once propose to myself to return it to its original proprietor without any consideration respecting the relative value of the two.

Still, as the moral philosopher observed who ate the sucking-pig which was sent as a present to his friend, 'One must stop somewhere;' and there is a limit even to my notions of what should be expected of an honest man. I condemn but cannot help extenuating the conduct of that paterfamilias who, upon the troublesome question of allowance of luggage, describes his party as 'seven first-class passengers,' when three of the same are infants, and pay no fares. The poor fellow reasons (I hope and believe) somewhat after the following fashion: 'The railway authorities permit little children to travel free; that permission is absurd unless they permit their baggage to travel free also, these iron cots are their private property; my own portmanteau has been partially usurped by certain heterogeneous garments of ridiculously small dimensions; this bag, which I am always instructed to "see to," and carry in my hand so carefully, and which clinks as I move, as though there were something frangible in it, must certainly belong to them, and should be conveyed gratis. Moreover, I was not asked how many tickets I had procured, but how many persons were travelling with me.'

This last exculpation I consider to be a reprehensible quibble; but if paterfamilias sticks solely to his first notion of the semi-generous manner in which the railway authorities behave in regard to infants, and practically reforms their half-measures—in spite of themselves—by giving a whole effect to them—that man has then my sympathy, though not perhaps my admiration. I confess I am not able to look upon a public company as upon a private individual. I have not imagination enough—my weakness arises from that, I think—to identify a Board with a human Being. I cannot detect that feeling of shame within me when I mulct an association of directors, which I should entertain if I took an article of value, or indeed any article, out of the coat-pocket of a single member of that body. I smoke in contravention of by-laws. I give money to luggage-porters, with a tacit understanding that I shall in return for it enjoy certain immunities, in spite of the particular requests

to the contrary that are addressed to me in print at every station, and of the 'Certain Dismissal' which is threatened so inexorably to the recipients.

With these little flaws in my otherwise immaculate moral character, it is not to be expected that I should entertain a servile respect for Her Majesty's Revenue laws; that I should religiously observe those Duties which are not so much natural as Customary. I do smuggle a little, when an opportunity offers itself, and that's the honest truth. In addition to the pecuniary saving, which is not inconsiderable in articles such as lace and tobacco, there is a considerable charm in defeating an organised system, in setting at nought a whole army of individuals that has been expressly levied for my discomfiture. Besides, if the worst comes to the worst, if a smuggler falls into the hands of a revenue-officer, he cannot be put to death, nor even transported for life: the risk of fine or imprisonment is of course considerable, but not more than sufficiently great to enhance the excitement. I had done a little in velvets, and made insignificant ventures of silk and jewellery more than once before I tried my first grand coup in laces, but I felt upon that occasion, I confess, excessively nervous.

It was autumn, and I was crossing the Channel to Dover amid a crowd of returning tourists, almost all of whom were dreadfully inconvenienced by a strong westerly wind. *Tot homines, tot sententia*, was never proved to be so false a proverb before. Numerous as the company was, it was all of one mind, or at least of one stomach; the deck, as a modern wit (who I wish was my friend) once observed, looked like some horrid picnic. It was terrible, as I stood at the bow, to see nothing else but the drooping hats and bonnets of my fellow-beings as the vessel dipped and rose—an endless game of pitch-and-toss, where nothing turned up but heads. One sea-green face, however, was visible, the property of a middle-aged lady of large dimensions, and it interested me very deeply. Those nervous eyes, that twitching mouth, that countenance vainly striving to look unconcerned, I recognised at once as belonging to the amateur female smuggler running her first cargo. She would have been ill, I could see, only she had too great a weight upon her mind to enjoy any such relaxation. She saw that I was looking fixedly at her, and a blush came over her face, at once 'making the green one red.' Yea, it was plain she smuggled; she was stouter than any woman of her general appearance had any right to be.

'Madam,' said I, approaching her by a series of gymnastic evolutions, which the unstable character of the plane whereon I moved compelled—'I see you

have no attendant; can I be of any service to you? I am an old sailor, and have, as you see, my sea-legs under me.'

The poor woman gazed on the limbs referred to with an unintelligent and frightened air; she had evidently never heard of 'sea-legs,' or else she had understood me to say that I had three legs, and she stared accordingly.

'I want nothing, sir, I thank you,' replied she feebly, 'unless you could put me on shore.'

'We shall be, my dear madam,' said I, taking out my watch, but keeping my eye steadily upon her—'we shall be in less than ten minutes at the Custom-house.'

A spasm—a flicker from the guilt within—glanced over her countenance.

'You look very good-natured, sir,' stammered she. I bowed, and looked considerably more so, in order to invite her confidence. 'If I was to tell you a secret, which I find is too much for me to keep to myself, oh, would you hold it inviolable?'

'I know it, my dear madam—I know it already,' said I smiling; 'it is *Lace*, is it not?'

She uttered a little shriek, and—Yes, she had got it there, among the crinolines. She thought it had been sticking out, you see, unknown to her.

'Oh, sir,' cried she, 'it is only ten pounds' worth: please to forgive me, and I'll never do it again. As it is, I think I shall expire.'

'My dear madam,' replied I, sternly but kindly, 'here is the pier, and the officer has fired his eye upon us. I must do my duty.'

I rushed up the ladder like a lamp-lighter; I pointed that woman out to the legitimate authority: I accompanied her upon her way, in custody, to the searching-house. I did not see her searched, but I saw what was found upon her, and I saw her fined and dismissed with ignominy. Then, having generously given up my emoluments as informer, to the subordinate officials, I hurried off in search of the betrayed woman to her hotel. She did not receive me warmly, and for a long time, indeed, refused to hear a word that I had to say. At last I overcame her antipathy so far as to get her to look at a piece of point-lace of twice the value of that which had been so ruthlessly taken away from her. I then placed in her hand the amount of the fine in which she had been mulcted. Then I began my explanatory statement:

'You had ten pounds' worth of smuggled goods about your person, madam. I had nearly fifty times that amount. If you were alarmed for the possible consequences of your rashness, what, think you, must have been the state of my feelings upon my own account? I turned informer, madam, let me convince you, for the sake of both of us. You have too expressive a countenance, believe me, for this sort of free-trading, and the officer would have found you out at all events, even as I did myself. Are you satisfied, my dear madam? If you still feel aggrieved or injured by me in any manner, pray take more lace; here is lots of it.'

We parted the best of friends.

I had a second adventure, the other day, of a much less dangerous character, but which, as it happily illustrates my great natural ingenuity, I here take leave to add. Having come from the Mediterranean a few weeks ago to Southampton, I happened to be in possession of a couple of pounds of exceedingly fine cigars, adapted to my special taste, and which I was determined no custom-house fingers should meddle with. As soon as the vessel was brought alongside the quay, I left my cabin, and made my way to the movable gangway.

'Sir,' said the official at the deck end of it, with a malicious grin, 'I think I must trouble you to take off your hat.'

'To you?' cried I—'never! You are not Prince Albert in disguise, I suppose, nor the Bey of Tunis!'

'Come, come,' exclaimed the fellow—official persons, it may be here observed, have the greatest possible dislike to being rallied, or, as the vulgar have it, 'chaffed' by anybody—'none of your mugs; you take that hat off, or it will be the worse for you.'

'Which hat?' asked I innocently—'whose hat?'

'Yours,' replied he savagely—'yours. It's tipped up over your forehead in a way which convinces me that you have something in it.'

'My very dear sir,' answered I blandly, 'of course I have something in it. I always carry my pocket-handkerchief there; and there's my head beside.'

This suspicious person telegraphed, nevertheless, to his confederate upon the shore, who seized upon me as I touched ground, and with the same ridiculous pertinacity, requested me to take my hat off.

'If you lay a finger on my hat,' cried I furiously, 'I'll first knock you down (I was six feet one without the hat, which was an exceedingly tall one), and then bring an action against you for an aggravated assault. I want to get into the town particularly, then, as friends expecting me—female friends; I insist upon being let go.'

The cold-blooded official smiled grimly without reply, and took me to his superior, by whom the same demand was repeated. I said that, in courtesy, and not upon compulsion, I would touch my hat to him; but that I would not take it off without a warrant. Then I was marched away in custody of a sort of guard of honour to the office of the superintendent. That individual convinced me of his right to enforce this absurd request of taking off my hat, and, under protest, and to oblige him, as being a very gentlemanly person, I did it. There was nothing in my hat, as I had affirmed from the very first, except my pocket-handkerchief. Officials never apologise; but I do hope that they felt they had wronged a fellow-creature by their cruel suspicions. I hastened back to the vessel, dived into my cabin, and presently reappeared with my tall hat tipped over my forehead more than ever.

'Would you like me to take my hat off?' inquired I of the first gangway-man. 'Would you like me to take my hat off?' asked I of the second. I demanded, in short, whether I should again bare my injured head of every custom-house officer who had been suspicious about that ceremony before. But they all looked sheepish or annoyed, and replied that they had had quite enough of me and my hat already. It was therefore certainly not my fault, but their own, that my two pounds of special *Regalias*, which really was in my hat the second time, have not assisted, in their proper quota of some eighteen shillings, to swell the revenues of my native land.

DR MADDEN'S 'PHANTASMATA'

UNDER this name, Dr Madden has given us a laborious, yet popular view of the various epidemic manias which raged in Europe during the middle ages, and particularly during the two excited centuries connected with the Reformation. It is a strange, wild subject, profoundly interesting as a chapter of the mental history of our race, affording many important warnings, and perhaps worthy of deeper philosophical consideration than it has ever yet received. Dr Madden treats it chiefly as a physician, tracing its connection with the more familiar forms of lunacy yet, being also a *littérateur*, he has not neglected to present it in such a manner as to attract the ordinary reader.

In the first volume, and earlier half of the second,

the learned author treats of the belief in sorcery in ancient and modern times, and of the lamentable cruelties thence flowing; of a succession of epidemic manias connected with religion, which marked the time when the Catholic faith was in its highest vigour; and of the hallucinations which befell individuals of extraordinary piety during that epoch, as Jeanne d'Arc, St Theresa, &c. It fully appears that, when the public mind in any community is oppressed with calamity and physical terrors—as from pestilence, famine, or the convulsions of nature—it falls, as by a fixed law, into a condition in which it becomes capable of the wildest extravagances and follies. It is but necessary for one person or little group of persons to adopt some ridiculous course of behaviour—dancing, jumping, self-torturing—or to avow some monstrous belief, as that the doctors are poisoning the wells, or old women exercising witchcraft against their neighbours—in order to smit a large portion of the community with the same practice or creed. We have a remarkable, though isolated, example in the Barking Disease which broke out in a district of England in 1341. 'A certain wayfaring man,' says Camden, 'as he travelled the king's highway found a paire of gloves fit, as he thought, for his own turne, which, as he drew upon his hands, forthwith instead of a man's voice and speech, he kept a strange and mervailous barking like unto a dogge: and from that present, the elder folke and full grown, yea, and women too throughout the same country, barked like big dogges, but the children and little ones waughed as small whelpes. The plague continued with some, eighteen days, with others, a whole moneth, and with some for two yeares. Yea this foresaid contagious maladie entered also into the neighbouring shires, and forced the people in like manner to barke.'

Conspicuous among the self-torturing manias was that which gave rise, in the fourteenth century, to the order of the *Flagellants* or *Scourgers*; for so we may date this mania in its full force, though it appears to have had temporary sway two centuries before, and even to have been known in the worship of pagan Rome. This order consisted chiefly of persons of the lowest class, who took upon themselves the repentance, or, rather, the penance of the people at large, and offered prayers for the averting of the great plagues that at that time ravaged Europe. These *Flagellants* marched in solemn procession, wearing mourning garments, and carrying 'triple scourges tied in three or four knots, in which points of iron were fixed.' In 1349, two hundred of them entered Strasburg, where above a thousand joined them; and thence, divided into two bands, some wandered north, some south. We have here two forms of mania combined—the migratory and the flagellatory. The subjects of this complicated malady, shewing insubordination to all authority, secular or spiritual, soon became obnoxious to the court of Rome, as well as to the petty princes of Italy and Germany. But it was by no means easy to put down the movement, which would die down for a time, only to break out again and again. Certain enthusiasts went so far as to frame a table of equivalents in stripes and sins, and a whole year's penance came to be estimated at 3000 lashes. A holy man, St Dominic Loricatus by name, attained to such proficiency, as to work off in six days, by the administration of 800,000 stripes, the penance of a whole century.

His example was followed by devotees of both sexes. Indeed, 'in Portugal, the women had become so accustomed to this bloody and fanatical devotion, that they uttered reproachful cries, and heaped injuries on those who did not scourge themselves violently enough, according to their notions.' Nor was scourging the extent of the self-inflicted torture; the very rigid practised other mortifications—they went barefooted, carried crosses of enormous weight, some bore naked swords stuck in the flesh of the back and the arms, which, upon any unusually vehement movement, caused, of course, extensive and agonising wounds, of which many died. Flagellant processions, we read, continued in Lisbon down to 1820; nay, even so late as 1843, Dr Madden saw confraternities of penitents walking, attired as of old, and bearing crosses, but without the torturing scourges.

A still more appalling form of epidemic theomania displayed itself, about the middle of the sixteenth century, among the frenzied Anabaptists of Holland and Germany. The outline of their brutalities and barbarities being in some measure familiar to us all, we will not dwell upon them at any length. Suffice it to say that one of their leaders commanded men and women to lay aside and burn all their clothes as a burnt-offering, agreeable to the revealed will of Heaven; that a woman in Basle believing herself to have received a divine promise of having her life supported without food, tried the experiment, and died in ten days; that in St Gall a family, having passed two nights in visions and prophecies, one brother called another, whom he dearly loved, into the middle of the room, and in the presence of his parents, and with the perfect concurrence of the victim, struck off his head, in professed obedience to a heavenly command; that at Fulda a prophet having been re-baptised, announced his newly acquired power of walking on the water, and prepared to cross a river in the presence of assembled crowds. Such was the faith his pretensions inspired, that a mother ran forward to place her baby in his arms. We wish that some accounts had been handed down to us of the reaction felt when infant and theomaniac disappeared under the water.

Scarcely less terrible was the epidemic theomania that manifested itself among the French Huguenots in Dauphiné and Languedoc, in the reign of Louis XIV. They had been subjected to every species of oppression and cruelty; and as Calmell, who has profoundly studied the question of popular frenzies, justly observes: 'Excess of suffering has a tendency to produce this form of mental malady.' The Protestants, tried, tortured to the utmost, without help or hope on earth, took refuge in their belief in supernatural assistance, and in that faith prepared to disperse and conquer, in their own way, the forces marshalled against them. On one occasion, the insane and unarmed multitude, being led on by a brother and sister—maniacs in the strictest sense of the word—against troops commanded by some of the bravest captains of the time, their method of warfare proved to be the blowing with all their might upon the enemy, and crying aloud: 'Tartara, Tartara!' firmly convinced that nothing more was necessary to their triumph! It is painful to read of three or four hundred of these poor lunatics falling on one day under the sword.

The theomania displayed in the Cevennes early in the eighteenth century was peculiarly prevalent amongst women and children. 'Thousands of women,' according to the Marquis of Guiscard, 'persisted in prophesying and singing, though they were hanged by hundreds.' 'I have seen amongst these people,' writes the Maréchal de Villars, 'things that I could never have believed, had they had not passed before my own eyes. Throughout an entire town, all the

women and girls, without any exception, trembled and prophesied publicly in the streets.

A most remarkable outbreak of specific popular monomania was that of the Jansenist Convulsionaries, which began in 1730. A certain Diacon François Paris, having ended a life of self-denial and active beneficence, his tomb became the scene of reputed miraculous cures and convulsions. As usual, the greater number of persons who came to this tomb in the cemetery of St Médard, were people of weak constitutions, chiefly females, labouring under epilepsy, neuralgia, and hallucinations of various kinds. With regard to the marvellous cures that took place among them, Dr Douglas, the learned bishop of Salisbury, after careful investigation, pronounces that 'few matters of fact were ever confirmed by more unexceptionable testimony, performed, as they were, openly in the heart of one of the greatest cities in the universe, on persons whom everybody could see and examine, and of whose recovery every inhabitant of the city could satisfy himself, because they lived on the spot.'

Amongst the involuntary physical phenomena, we read of one woman repeatedly shot up into the air with great force, and urging out numbers who successively undertook the charitable task of seeking to restrain her convulsive movements; of another, whose body was often turned round as if on a pivot, of a deaf and dumb girl who, after two visits to the tomb, and horrible convulsions undergone there, was found able to hear and speak, though without understanding the words addressed to or repeated by her. Nor were women the only ones involuntarily affected. We read of an incredulous secretary of state, M. Fontaine, being converted to Jansenism when at a large dinner-party, by feeling himself suddenly compelled to turn round and round on one foot with prodigious swiftness. These involuntary gyrations lasted upwards of an hour. As soon as they began, 'an instinct which he believed from above prompted him to ask for a book of prayer, and the one which first came to hand, and was accordingly given to him, turned out to be a volume of moral reflections by Father Queœnel.' Not the least part of the wonder was his power of reading this book aloud while turning round with 'dazzling rapidity.'

Poor M. Fontaine next became subject to ecstasies, trances, and visions; he practised and survived a total abstinence of eighteen days, during which he employed himself by day in manual labour, while he passed the night in prayer and in the recitation of psalms. No sooner had this unfortunate zealot partially recovered his health and strength, than he began to subject both to the still severer ordeal of a three-weeks' fast, at the end of which he was an apparently dying man. Nothing daunted, however, he had scarcely regained a measure of strength, when he put into execution his fast of forty days, during which, however, he drank freely.

The account of this Jansenist frenzy would be incomplete without some further notice of the convulsive phenomena to which the sufferers were subject. During these, there appears to have been no amount or variety of torture which was not loudly called for by the Convulsionaries, and abundantly inflicted by those who held it a sacred duty to obey their insane requirements. Montgérion computes that 4000 enthusiasts were employed to kick and strike the infirm as well as the multitude of young girls, who begged for their rudest blows. We read of one who hung herself up by the heels with her head down, and remained in that position three quarters of an hour; of another, who, after being struck on the head with one log, then with four logs, had her arms and legs violently pulled in different directions, which process lasted a long time, because there were only six persons to pull; of numbers of fair and delicate

women who did not shrink from applying their lips to the foulest wounds, under the impulses of a morbid charity. This form of insanity, though in a great measure repressed by the royal order to close the cemetery of St Médard, issued in 1732, lasted, according to Hecker, till the year 1790, when France was on the eve of another and still more fearful development of popular frenzy. But this Jansenist outbreak was the last great epidemic of convulsive *théomanes*.

A large portion of Dr Madden's second volume is occupied with an account of the not less wild and strange demonstrations which were made in the French and German convents during the century of reaction which followed the Reformation. It was supposed that, under the influence of some power possessed of unholy powers, evil spirits entered into the nuns, who thenceforth shewed a frightful change of demeanour, falling into convulsions and apoplexy, in the course of which they flung themselves about in the most violent manner, foaming at the mouth, roaring like animals, speaking occasionally in what were thought unknown tongues, blaspheming, assuming attitudes grossly indecorous; sometimes falling down in a rigid and torpid state, in which they were found to be insensible to prickings and lacerations of the flesh; at other times, bounding into the air with a force that seemed to come from some source independent of the natural muscular power. Occasionally they would throw themselves into the form of a bow, bending backward so as to rest the whole weight of the body on the forehead, while the rest was in the air, and in this uneasy posture they would remain a long time. A strange howling, like that of a dog, was sometimes heard to proceed from the chest. During the paroxysms, the victims expressed aversion for those prayers and rites of the church which at sane moments, they regarded with veneration, and to which it might be said they had devoted their lives. The moment the fit was over, to the surprise of the bystanders, they would resume their usual calm demeanour, and walk away as totally unaffected by the frightful contortions, spasms, and ravings under which they had for hours been suffering. When one of these affections of this kind appeared in one or two members of a community, it usually spread quickly amongst the rest, notwithstanding the wishes of the hitherto sane to avoid it. What is more remarkable, pious ecclesiastics of the highest repute for sanctity of life, who came to do their best as exorcists, were frequent instances seized with the same disorder.

The statement made after recovery by Thérèse Sylva, superioress of a Benedictine convent at Mâcon, which became affected with demonopathy in 1684, gives a good idea of how the so-called possession would commence. Two or three of the inmates had been exhibiting symptoms for some weeks, when the superioress began to feel internal movements of an extraordinary character. 'She prayed frequently and fervently to be delivered from this great evil. Eventually she prayed the prior, Father Garcia, to exorcise her. He refused to do so, and tried to convince her that all she recounted was the effect merely of imagination. She did all in her power to believe that it was so, but it was in vain. Eventually the prior put on his stole, and after many prayers, begged that God might be pleased to make it known to her if the demon had possessed her, or to cause those cruel sufferings she endured to cease. Long after he had commenced the exorcism, and while she felt altogether comforted and relieved, freed from all sufferings, she fell all at once into a kind of swoon and delirium, which 'continued about three months,' during which she was impelled to do and say 'things of which she never had an idea in her life.'

A good example of the spread of the affection to an exorcist is furnished by the case of Father Surin, who

came in December 1634 to assist in expelling demons from the Ursuline nuns of Loudun. Before he had been at work more than a month, he was so far affected as to lose his speech. Then a demon, who possessed the face of the superioress, and spoke by her mouth, suddenly left her, and took possession of Surin, causing him to change colour, constricting his chest, and also depriving him of speech. Being exorcised out of the father, the demon returned to the body of the superioress; soon after, it came back to the father, who now began to suffer internal pains that caused him to twist his body like one afflicted with the cholera. Writing to a friend regarding his sufferings three months after, he tells how the demon passes from the possessed person into himself, throwing him down in convulsions which last for several hours. 'I cannot explain,' says he, 'what passes in me during this time, nor how that spirit unites itself to mine, still acting like another self, as if I had two souls, of which one is deprived of her body and of the use of her faculties, and holds herself apart, contemplating the actions of the soul which now occupies the body. The two spirits fight in the same field, which is the body, and the soul is, as it were, divided. On the one side, the soul is subject to diabolic influence, and on the other to her natural inclinations, or those which God gives. . . . When, prompted by one of these devils, I wish to make the sign of the cross on my mouth, the other devil, with great rapidity, turns away my hand, and catches my finger with the teeth, to gnaw me with rage. . . . The extremity in which I find myself is such, that I have scarcely one free faculty. When I wish to speak, my mouth is closed; at mass, I am suddenly stopped; at table, I cannot convey the morsel to my lips; at confession, I forget in a moment all my sins; and I feel that the devil comes and goes, as in his own house, within me. Directly I awake, he is with me at prayer; he deprives me of consciousness when he pleases; when my heart would expand itself in God, he fills it with rage; when I would watch, he sets me asleep; and he publicly by the mouth of the demoniac (the sister-prioress) boasts that he is my master.'

It was the afflictions of these nuns of Loudun that led to the celebrated prosecution of the obnoxious priest, Urbain Grandier. When this dismal case is treated among modern rational authors, it is customary to hold up the nuns as practising an imposition for the destruction of an innocent man; but the theory of a deliberate or systematic imposture on their part is precluded by the fact of the continuance of the same painful demonstrations for several years after Grandier's execution; and, moreover, the Loudun possessions are but one example of many in which there has been no such malignant object alleged. For anything that appears, the Loudun nuns were as much the victims of some influence beyond the control of their own better sense, as any others that gave similar manifestations. In our time, were such phenomena to present themselves, they would be treated as disease, and, instead of religious exorcisms, which seem only to have fed the malady, there would have been some strong alternative treatment of a purely physical kind. It may be suspected, however, that there was something more in these cases of so-called demonomania than what our orthodox medicine is willing to admit. The resemblance of many of the phenomena to those of mesmerism is extremely striking.

Our readers will understand that these are but glances at a series of strange and wild *historiettes*, which they will find in full and interesting detail in Dr Madden's book. We close the volumes of our learned author with thanks for his bringing so many curious matters into a regular and accessible form. With his theories regarding them, proceeding as these

do on the narrow views of existing medical science, we cannot say we are satisfied. They all seem to us to rest on some assumption, and they certainly ignore whole classes of facts as well attested as any of the rest.

DOWN AT THE GRANGE.

I.

As soon as the few friends who visit this little vicarage of mine at Woodislee, for the first time, have done admiring its low white front, all garlanded with honeysuckle, and the wild growth of ivy overhead, I take them to the school-house, as a sight more pleasant still; quite as large, and twice as high it is, and built of rough-hewn stone, with a porch almost as big as the house itself, to shelter the children when they come too early for their school-time. The thymy smell of the moorland is borne to us as we approach, along with the murmur of their voices, making it seem doubly like the hum of bees; and the stock in its garden, and the sweetbrier that peers in at its open casements, make the air fragrant within. The school-rooms of both boys and girls are lofty and well ventilated, and however their young hearts may long to be up and away over the purple hill, there is, at least, no headache nor drowsiness to dull their little wits. In the winter-time, too, all is snug and warm, so that fewer small red noses, and a less universal infant snuffle, are perceptible in the school-house of Woodislee than in any similar place that I am acquainted with. The squire built it at his own expense, and the cottage of the master and his wife beside it likewise. Higher upon the moorland yet—a beacon to be seen from half-a-dozen counties, and a landmark for the ships that come up from the western world—stands the new church, and has stood there those ten years in despite of the four winds. Oh, pleasant sight upon a Sabbath morn, while the bells are still ringing their first peal, and along the winding sand-road come the good people up by twos and threes: the young men in their clean white smock-frocks, and the girls in gay apparel; the old men toiling slowly with hat in hand, their gray hairs lifted by the breeze, and their old dames resplendent in the scarlet cloaks they are so loathe to leave off wearing, though the summer is come; and all, as they stop to rest from time to time, turning to westward gladly for that glorious view. The glimmering towns, from which, too, comes a faint and far-off music; the teeming hedgerows, with the deep blood-red Devon lanes; the crystal river hiding from the sun in the cool copses; the sparkling sea, with its fair burdens mostly motionless, but on its verge a dim white speck that grows, and close in-shore (that was itself a speck when the bells rang for school an hour ago) a huge three-masted ship—an isle of snow, or a white cloud fresh fallen; and so with thankful hearts, I hope, for the fair world that has been given us to dwell in, we enter into church at Woodislee. Massive need its walls be, and the tall gray tower, straight and without flaw, when the fierce north-wester blows—and they are so. The good squire built this also—Mr Markham that is, who lives in the great house yonder with the gables, which is called the Grange.

When I first came to Woodislee, I came as curate, for the incumbent was near ninety years of age, and very infirm. I had a hundred pounds a year, and the little cottage that is now in ruins close by the old church, to live in, and never dreamed to have done better. That would have been enough and to spare, indeed—without my good wife here and the four little ones of course, who then were not in the question—for the place is not a dear one as to living. The Brent,

which you have seen, runs by our door, supplied me well with trout, and I was my own fishmonger. A knife and fork, too, were always laid for me at the squire's board; and on Sundays, without exception, I was there to use them. No mere bluff country magistrate was Mr Markham:

A lord of fat prize-oxen and of sheep,
A raiser of huge melons and of pine,
And pamphleteer on guano and on grain.

Or rather, he had all the qualities of such a man, and finer ones besides: a good scholar, an elegant musician, and a gentleman as I discovered at the first; who pleased my Oxonian fancy with his classics, and knew the literature of his own land also at least as well; who played on flute and violin divinely; and who, when lords and bishop and county families rayed round his table, remembered not the less—a virtue very rare in hosts—the curate of Woodislee. Of his real worth and goodness, I knew more as I knew him longer; his open hand, his kindly heart, are dear even to speak of. I bring one proof of them, not stronger than I could select from a crowd of others, nor better witnessed, although it affects myself. The Sunday after poor Mr Melville—the old incumbent—died, I was, as usual, at the Grange; and, as was natural, our talk fell upon his loss and on the future vicar.

'I have appointed one in my own mind,' said Mr Markham; 'and if he chooses to accept the living—as there is no reason whatever for delay—he will read himself in within the month or so: a young man not over-rich, who knows the people here, and is well liked by them.'

'I fear then, sir, he will not want a curate, since the parish is so small?'

'No; I fear not, Grantley. We shall be sorry to lose you, although we have seen so little of each other; but I will have you in my eye be sure, as will my wife, in whose way curacies come somehow more than they do in mine.' And so we parted for that time with a hearty hand-shake.

Ah, what a wife that Mrs Markham was! a fair blithe woman then, with auburn hair just dusted o'er with gold, and wearing her thirty summers like a flower. She, with her pleasant smile, was the fit messenger to tell me ere the month was up that I myself was the new vicar of Woodislee. She took as great delight to bring the news as I to hear it. 'The vicarage is yours,' said she; 'and may this please you, Mr Grantley, as it pleases us. It was not with my will that it was kept a secret from you for so long; but you know my husband loves his kindly joke.'

It was not likely after this that I should become less their friend; and indeed the Markhams and myself were for ever together. Both as clergyman and as familiar intimate, my intercourse grew very close with them indeed. I learned (with pains enough) even to join their little concerts in the hall; I read with them old plays in winter evenings; and the vicarage was almost less my home than was the Grange. I am not sure that they did not choose my wife for me, if so, I have the greatest gift of all to thank them for; and they stood both of them as sponsors to my eldest boy. About two years after I had been installed as vicar, I began to observe a great strangeness in Mrs Markham. She grew absent, started when addressed—especially if by her husband—wasted visibly, and lost in part her pleasant looks. The squire did not see this; she had always a smile to greet him with, however she might look to others; and would watch him sometimes, when he was not regarding her, with a concentration of affection in her gaze more intense than ever. Another change was this: the squire's fortune being very large, his wife had a most liberal

allowance, and kept quite a little establishment of her own. Her charities, besides those that were in common with his, were extensive. When any persons needed help beyond that which I was justified in giving, I had been accustomed to apply to her as readily as to him; but now her aims at first diminished, and then altogether ceased. She parted, under some frivolous pretence, with her carriage and ponies, and, from being rather fastidious and choice in her attire, she came to dress with great simplicity, and almost ill; so that upon that point her husband rallied her. One night she was singing with us in the hall, as usual, a favourite Scotch song of his that she had sung a hundred times before, when her voice suddenly trembled, as though her heart was breaking, and she burst into a fit of tears. It was one of those exquisite melodies of Burns upon the domestic affections, and Markham spoke touchingly to me afterwards of that excessive fondness of his wife for him which had so completely overmastered her. 'If I were to be taken from her,' said he, 'I do believe dearest Jane would die.'

Certainly, to watch her anticipating his slightest wish, and listening to his every word as though it were to be his last, it might well seem so. Upon my venturing to remark to him that she was generally in by no means good health, and not in her usual spirits, he thanked me, and was nervously alive to this at once; and thinking a little company might cheer her, he sent for his maiden sister from the north to spend some time with them—a quiet elderly lady, very excellent, but not in any way gifted as her brother and sister-in-law were. We two struck up an acquaintance very soon, and the squire was wont to make facetious allusions to it which would have been embarrassing from anybody else. She soon filled up, in some measure, that position of Lady Bountiful in the parish which Mrs Markham had abdicated—although I confess she somewhat lacked the gracefulness of her well-doing—and evidently to that lady's satisfaction. It left her more to herself, and at liberty to retire to her chamber or elsewhere, as had now become her favourite custom. This, combined with the other peculiarities in her conduct, although still veiled from her husband's notice, did not escape the quick womanly eye of Miss Markham.

'I cannot think,' said she, as we were taking a parochial walk together about three weeks after her arrival, 'what change has come over Jane. If we did not know herself and George to have been the most loving couple that ever breathed, I should be inclined to think her an unhappy wife; and if I was not thoroughly convinced of the badness of her late husband, that she was regretting his loss.'

I had never heard until that moment of Mrs Markham having been ever a widow, and I expressed my surprise strongly.

'Indeed?' said my companion. 'I had made certain that they had intrusted you with that revelation; but since you are aware of so much, you may now just as well know all.'

II.

'Mrs Markham, whom, you perceive, even at this time, charming and almost perfect as she appears, to be extraordinarily sensitive and unsuspecting of evil, was, as Miss Jane Raby, romantic to the last degree. She eloped at school, at the age of seventeen, with an adventurer named Heathcote. I never saw him myself, but I have been told that he was in youth extremely handsome, and gifted with some attractive but superficial talents. After living together a short time in great unhappiness, so far as Jane was concerned, he deserted her, and sent her back to her friends. He did not appear again for years. He must have treated the poor girl very

brutally, to account for the horror and absolute loathing which she entertained for him. He knew that she did so, and used that knowledge for his own profit. He had openly boasted that "he had not married a milkmaid like her for nothing, but for her money;" and the moment which secured to her her property, the very day on which she came of age, brought this harpy to her side again. She bought him off with ransoms, then and at many other times, as the civilised nations in old time bought off the savage, and with the like result—he became more frequent and extravagant in his demands. When I say that he was a systematic gambler and a drunkard, I believe that I have mentioned only his lighter foibles. The relics of her original fortune only remained to her, when he required of her a blank check to be filled up at his own pleasure. This, backed by her paternal uncle, and sole relative, in whose house she was then residing, she steadily refused to give him; and Heathcote, uttering the most frightful threats, was obliged to content himself with a draft drawn by Mr Raby upon his own banker for a hundred pounds. He drew it merely to save his niece, who was in an agony of terror from her husband's violence, and to get the man out of the house as quickly as possible; but, as the matter turned out, this was the luckiest thing in the world. Heathcote altered the "one" upon the order to "five," and the number "100" to "500," and so got the check changed by the commission of a felony. The next time that this fellow came for his merciless tax—which was soon enough—Mr Raby had a policeman in waiting for him. "If," said that gentleman, "you ever again attempt to persecute my unhappy niece, I transport you for the term of your natural life. You may thank her alone that I suffer you to escape your just punishment this time. If it rested with me only—and luckily the proof of your penal crime does rest with me, and with no 'milkmaid'—you should be shipped off as soon as law could ship you." Heathcote hectoring a good deal, and strove to obtain an interview with his poor wife; but Mr Raby was firm. He told him out one hundred five-pound notes, and enclosed them in a cover, whereupon he wrote his own name and address, to remind him of this compact, telling him that it was the last handwriting and the last shilling of his that he should see. The conditions of gift were, that the recipient should depart for Australia forthwith, and never set foot again in England. "The fellow five hundred, the forged check, sir, is in my own possession; and if I ever see your face again, shall be produced in a court of law"—which penalty the other, there being no help for it, agreed to. Heathcote's brutality must have been something excessive to have trodden all traces of love out of a heart like Jane's; but he had quite succeeded in so doing. Although she had not consented to her uncle's threat being held over him—and happy was it that it did not rest with her to use it—she could not but feel comfort from the event. Six months' experience of freedom did wonders in restoring her roses and lightening her heart of a sorrow that seemed likely to crush it altogether. She began to move about less like an automaton, to wear the smile of content, if not of merriment, and to be in some sort like the Jane Raby of five years before. Then came some news which made her serious and silent a while, but could scarce have made her sad: Heathcote was dead in the bush, slain by the hand of one of his own wicked companions. In a concealed pocket within his vest was found the roll of banknotes in their still unbroken cover. It had escaped the eyes of his murderer, or the passing by of some honest settlers had disturbed him in his unfinished search. They forwarded the parcel to Mr Raby, with a narration of these facts. A year after this

event, it would have been impossible to recognise the spirit-bowed and fragile Mrs Heathcote in the by no means inconsolable widow which she had then become. Thanks to her brief matrimonial career, she was not rich, but beautiful and happy as you see her now, Mr Grantley, or rather as you did see her until within these few months. My brother married her with the full knowledge of her former life, and has never had a moment's cause, as he says himself, to regret his choice.

This narration, which the kind-hearted but mis-doubting little old maid made piquant with various garnishments of her own, in the way of flings at the foolishness of young girls, and the futility of early marriages, did not much enlighten me, as to what was ailing with poor Mrs Markham, although it increased my interest in her fortunes. Her conduct towards myself remained unaltered, or was marked by even greater communicativeness. She put to me several hypothetical cases of conscience, of which I could see no possible bearing on herself, and begged me, as a clergyman, to give her my best opinion on the subject. She told me that she had often bewailed the having no children, which she had once considered to be the sole blessing that had been denied her; but that now she thanked God she was childless. The horrible thought began to cross me that my dear benefactress and firm friend was going out of her mind; and that idea grew stronger, although Miss Markham shook her head at it, and hoped it might be no worse. She was as good a person as ever lived; but she had the weakness of her order, which somehow is always to think the worst that can be of all her sex. But when I had seen Mrs Markham come out of the firwood, under the sandcliff, a little after sunrise one morning, and she told me, pale as a spectre, and quivering in every limb, that she had only been to get an appetite for breakfast; when she asked me at another time for the loan of twenty pounds for a very pressing emergency, and begged me to keep it secret; and when I coupled with these things her piteous endeavours, so transparent to myself and her sister-in-law, to conceal her unhappy condition at all times—a mark most significant of an unsettled brain—I felt quite sure of my painful surmise being but too true. I was even debating how to break this horror to Mr Markham, that remedial measures might be resorted to before it was too late, when a circumstance occurred which changed my suspicions into a certainty even still more terrible.

(To be concluded in our next.)

T A R.

No person of a meditative turn of mind can long remain a spectator of the improvements effected in almost every department of the manufacturing world, without being profoundly convinced of the immense strides which have of late years been made in the practical applications of chemistry.

Chemistry, to our forefathers, was a vague and speculative science, having no bearing, direct or indirect, upon any one of the arts or manufactures. The learned found, in its unmeaning nomenclature, a convenient shelter for their own ignorance on many points; and the unlearned looked upon it as far above their comprehension, and altogether void of useful or practical application. One or two great men, of whom Robert Boyle ought perhaps to be placed first, disgusted with the arbitrary rules which had been laid down by the chemists, founded, most of them, on the mere *ipse dixit* of men wholly unacquainted with the cause of any natural phenomena, attempted to overturn the more absurd parts of the so-called science; and their exertions met with a

good deal of success, and paved the way for great improvements.

At the present day, chemistry is *par excellence* the science having utility as its invariable result, and working hand in hand with nearly every art and manufacture. Yet it has not become a common, a simple, or an easy pursuit; it is perhaps as difficult, and even more so, to gain an intimate knowledge of modern, than it ever was of ancient chemistry. If it was troublesome to recollect the thousand and one peculiarities attributed of old to phlogiston—*caput mortuum, quinta essentia, terra vitrificabilis, and terra fusibilis*—it is no less troublesome, at the present day, to recollect even the names of such substances as arseniomethylmylum, stibiotetramethylum, hydrargobenzenamide, and trichloracetamide, although these latter words exactly express the composition of the bodies they index, and are the simplest which, compatible with correctness, can be put together.

Nothing will so clearly shew the advantage which has accrued to society generally by recent chemical investigation, on an examination into the manufacture of some article brought before us in everyday-life.

When, owing to some great convulsion of nature, a mighty forest, with trees of a magnitude unequalled in this post-diluvian world, with tangled thickets and waving fern beneath them, is buried hundreds of fathoms below the surface of the earth, and pressed down for centuries into the smallest possible compass by millions of tons of matter resting upon it, it might be supposed, that so far as the uses of mankind were concerned, a great and irreparable loss had been sustained. The noblest of those trees, if hewn down and exposed for a hundred years or less to the action of the atmosphere, would rot away, and be resolved into the simple forms of matter, by the union of which they were constituted. Then what will it be after fifty, sixty, or an indefinite number of centuries have rolled over the globe?

Certainly they would not be *lost*. Nature neither wastes nor loses. When those forests existed as forests in all their beauty, there was no hand upon the earth to hew them down, no inventive creature to make use of their productions. Nature acted like a frugal housewife; and just as Mrs Brown or Mrs White, finding in her garden the supply of gooseberries exceeding her present demand for that fruit, 'preserves' the surplus for winter use, in the form immediately recognised by the little Browns and Whites as 'jam,' nature preserved her vast and otherwise useless forests in great sunless, airless storehouses, in the solid crust of the earth; and now gives them up to her sons in the no less valuable form of coal.

From coal, man has obtained many things which he would have vainly sought for otherwise; and not least of these products, though, until lately, poked quite away in a corner, he has obtained *tar*.

Every reader is perfectly familiar with the colour, odour, and generally disagreeable nature of tar. We don't mean the rich, fragrant, foreign fluid, prepared from the roots and otherwise useless portions of resinous firs, and known as Stockholm tar; nor yet the purer extract furnished by the wood-vinegar or pyroligneous-acid-maker. These are tars, but they are not our tar: our tar is far more disagreeable than any other kind, and is usually called, in allusion to the source whence it is obtained, *coal-tar*.

Coal-tar is torn from the long embrace of its parent coal, at the period when that parent yields up to the service of man a no less cherished offspring, gas. As coal is heated in confined chambers, the carburetted hydrogen, for the production of which the operation is performed, is separated, and with it a quantity of the black treacle-looking fluid known as tar. This is collected in proper receptacles, and as it is of no use

to the gas manufacturer, is sold to those whose special business is its preparation.

Until the last few years, the applications of coal-tar were very simple, and very limited: it was spread over a vast variety of substances which required its preserving influence to guard them from the weather; it was used as a rough varnish for gigantic ironwork; and it formed an important ingredient in various compositions used instead of stone for esplanade purposes.

Modern chemistry, however, attacking one by one the myriads of matters entering into the composition of this 'terrestrial ball,' one fine day seized hold of tar; and after torturing the poor fluid in a thousand different ways, examining and cross-examining it by its ministers, heat and cold, acids and alkalis, tests and reagents, pronounced it a very remarkable and highly complicated substance.

What is tar?

Tar is a union of a very considerable number of organic bodies, some being solid, and others fluid. It contains—if you desire a clear and satisfactory idea of its composition—ammonia, aniline, picoline, quinoline, pyridine, phenic acid, rosolic acid, brunolic acid, benzoic acid, toluole, cumole, cymole, naphthaline, paranaphthaline, chrysene, and pyrene. As each of these sixteen substances is individually more or less complicated, we are not, we think, wrong in saying that the fluid formed by their union is somewhat remarkable.

We went go into the *chemical* nature of tar; we might say about every one of its constituents as much as would fill half-a-dozen columns of this *Journal*, and yet those constituents are as yet but very imperfectly understood. We prefer rather glancing at the actual serviceable products which have been obtained from coal-tar.

The apparently simple business of the tar-worker is to take his tar to pieces; not to separate it into all the various components we have enumerated, for that would be a very difficult, and perhaps useless proceeding, but to extract from it a number of vastly different bodies, which have been put to a variety of uses in the manufacturing world.

In nearly the whole of his operations, the simple agent used by the tar-worker is *heat*. It is one of the fundamental laws of chemistry, that every fluid at a certain temperature shall assume a gaseous form; the temperature at which such change takes place being entirely dependent upon the nature of the fluid operated upon. The highly complex body, tar, is therefore placed in certain large stills, each containing from 2000 to 3000 gallons; and heat being applied, the tar in time begins to boil; and each of its fluid constituents, which assumes the form of vapour at a different temperature from the others, separately makes its appearance at the end of the still-worm.

The first of these is a quantity of ammonia and other gases, all of which are collected in cold water, which soon becomes strongly impregnated with them, and is used for the preparation of a rough description of sulphate of ammonia, which finds a ready sale as an important ingredient in certain artificial manures.

As the heat is increased, an oily fluid comes over, technically called 'light oil,' which is carefully collected apart from the other products. When as much of this light oil has made its appearance as about equals in bulk one-twentieth of the tar originally put into the still, it ceases to be produced, and is succeeded by a dense dark-coloured fluid, with a peculiarly offensive odour, known as 'dead oil.' The dead oil comes over in much larger quantity than the light oil, equalling fully one-fifth of the tar. When the dead oil has ceased to run, the distiller knows it is of no use to keep the pot boiling any longer; the fire is therefore put out, a huge tap at

the bottom of the still is turned, and the thick black residuum, still fluid in its heated state, being neither more nor less than common pitch, is allowed to run along certain channels prepared for its transmission, into immense underground tanks in which it is stored.

By simple *boiling*, then, our manufacturer has split up his tar into four very different matters—pitch, dead oil, light oil, and ammoniacal liquor.

With the pitch he does very little. Shortly after running from the still, it is ladled out of the great tanks already mentioned into moulds formed of the halves of resin-casks, rubbed with chalk on the inside to prevent its adhering; and being sold in this state, it is used for a variety of well-known purposes.

The greater part of the dead oil, too, has no further process to undergo. The product is in reality a rough mineral creasote, and possesses in a high degree the antiseptic properties for which creasote is so celebrated. The dead oil is about the most important thing got out of the tar; thousands and thousands of gallons are every week sold to the different railway companies for the soaking of sleepers and other timber; for once well impregnated with the fluid, every description of wood may bid defiance to both wet and dry rot. A good deal of the oil is, however, used for a very different purpose. It is exceedingly inflammable, and contains a large amount of carbon; and these two peculiarities are taken advantage of by slowly burning it in curious little lamp-furnaces connected with vast brick flues; the smoke from the burning oil is rapidly deposited on the sides of these flues in a form which washerwomen would recognise as 'blacks;' and being periodically scraped off, it makes its appearance in the market as 'lampblack.'

The light oil is, however, a substance requiring a good deal more preparation, and serving a greater variety of purposes than any of the other products. Light oil is impure *coal naphtha*; and to free it from its impurities, especially those affecting its colour and smell, is the crowning object of the tar-distiller.

As it comes over, in the first instance, it is a dark-brown liquid, smelling most horribly. Being in this state all but useless, it is at once redistilled, and loses a large amount of smell and colour. It is now ordinary 'naphtha,' and used for a variety of purposes, but it still contains a large quantity of a peculiar greasy matter, called 'paranaphthaline,' from which no amount of distilling would entirely free it. To separate it from this paranaphthaline, therefore, it is mixed with 'oil of vitriol,' in an iron reservoir, and the acid and naphtha are thoroughly shaken and stirred together. For some little understood reason, the fatty paranaphthaline leaves the naphtha, and attaches itself to the acid, carrying along with it a vast amount of impurity, and leaving the naphtha in a very commendable state of cleanliness. As the oil of vitriol is nearly three times as heavy as the naphtha, directly the stirring and mixing process is at an end, the two bodies separate, and are drawn off from the reservoir into proper receptacles.

The naphtha is now either sold in its present condition, or again distilled. For the most particular purposes, indeed, it is distilled or rectified three times, the whole operation being conducted by the steam of boiling water; and the fluid is known to the trade as *once*, *twice*, or *thrice run* naphtha respectively.

Here the legitimate labours of the tar-distiller end. He has prepared from his black tar, pitch, creasote, lampblack, naphtha, and sulphate of ammonia. The first three are used, as we have already said, in their existing forms; while the fourth, the coal-naphtha, has yet to undergo a greater variety of changes, and to fulfil a larger number of offices, than all the other products put together.

In the state in which the naphtha leaves the tar-worker's yard, it is used extensively for illumination,

for which it is eminently fitted by the immense amount of carbon it contains; and if the lamp employed in burning it be only so constructed as to allow of the actual *combustion* of this carbon, the light emitted is probably greater than that obtained from the same bulk of any other known substance. It is also a solvent of caoutchouc, gutta-percha, and other guma, and therefore much in request by the varnish-maker; whilst purified and deprived of its smell, by some secret method it becomes the benzine collas, extensively used as a valuable detergent of grease from wearing apparel, &c.

When coal-naphtha is submitted to the action of certain chemical bodies, totally different from itself in their nature, the most remarkable changes take place in it; certain of its principles unite with certain elements of the added body, and compounds are produced of the most unexpected nature.

Thus we have said that one of the constituents of tar is *benzole*; how, when the tar is distilled, and separated into the dead oil and the light oil, this body benzole suffers no alteration in its nature; its affinity for some of the other ingredients of the naphtha is so great, that simple heat is altogether insufficient to produce a disunion; and the consequence is, that the benzole goes over with the light oil, and continues to form part of it.

By using rather more energetic chemical means, however, the benzole may be separated from the naphtha, about a pint being obtained from two gallons. It makes its appearance as a heavy, oily substance, with very little smell, and a pungent taste. When this apparently useless fluid is mixed with nitric acid or aquafortis, a singular phenomenon occurs—the two substances, the benzole and the acid, unite, and produce what chemists call *nitro-benzol*, a fluid precisely resembling in smell and taste oil of bitter-almonds, and extensively used in various ways in place of the more expensive and poisonous substance which it represents.

Yet another strange transformation may be effected. *Phenic acid* we have enumerated as existing in tar; and phenic acid, like benzole, is not altered during the process of distillation, but passes over with the naphtha, and forms part of it. Phenic acid further resembles benzole in being of little use in its pure state. When, however, it is treated with nitric acid, already mentioned, and evaporated, long pale-yellow crystals, bright and clear, make their appearance, very beautiful to the eye, and intensely *bitter* to the tongue: these are crystals of *carbazotic acid*. Their colour has caused a solution of them to be extensively used in dyeing silk; their taste has made them serviceable in adulterating beer.

Using only the multifarious processes placed at his command by modern chemistry, the investigator into such matters has gone on experimenting upon all the compounds of this curious body, tar, and has baptised with fearfully hard names the substances produced therefrom, until he has given us binitrobenzol, hydrobenzamide, bi-bromide of chlorabronaphthene, and a dozen other no less mystifying substances. Those above mentioned are, however, the principal ones which have yet been put to any practical use.

Who will despise the nauseous black coal-tar now? With substances obtained from it, we have rendered our timber impervious to rot, have painted our dwellings, paved our streets, made our varnishes and water-proof garments, taken grease from our Sunday clothes, manured our fields, dyed our silken fabrics, adulterated our beer, and flavoured our soaps, sweetmeats, and confectionary!

Who can tell what else we shall get from this queer stuff? Chemical research occupies a long time; and chemical experiments of any importance can be performed but by a few; hence many of the sixteen

constituents of tar have hitherto been little studied. When they yield up their secrets to the magic power of analysis, other bodies quite as useful and remarkable as those we have mentioned, and perhaps even more so, may be presented to us from that most prolific substance, coal-tar.

STOP THIEF!

In some parts of India, house-robberies are almost unknown; you may leave your doors open every night, and take no precaution, yet never be one whit the poorer; while in most of the cantonments of the upper provinces and other places, you will be robbed for certain, unless you have a regular night-guard, or keep a *chokoedar* or watchman. Your safety does not consist in the vigilance or prowess of this individual, but simply in the fact that thieves and *chokoedars*, if not, as some assert, one and the same individuals, have a mutual understanding with each other; and when you literally fulfil the proverb of 'Set a rogue to catch a rogue,' by retaining one of them as your servant, all the rest respect your property.

Long practice enables the *chokoedar* to sleep in almost any position; sitting, lying or standing, no matter how uneasy the posture or hard the resting-place, all come alike to him. He sleeps tranquilly in the verandah during the greater part of the night; occasionally he rouses himself, and stamps round the house, making a great show of vigilance, by clattering his stick, and uttering a peculiar sound, as if he was clearing his throat in a passion; but this is entirely to display his zeal for your benefit, not from any fears for your goods and chattels. Sometimes he will ask leave of absence for a day or two, and your property remains quite secure, though you need not be astonished if you hear that your *chokoedarless* neighbour has suffered considerably in the interim, and may form your own conjectures regarding the way in which your servant has employed his holiday.

Sometimes an individual was found hardly enough to refuse to pay this black-mail, and trust for security to a brace of pistols and a dog. But, sooner or later, the fine morning came on which he awoke to the consciousness that the rogues had outwitted him, and that all or some of his valuables were absent without leave. Pistols are easily tampered with; and though a good watch-dog is the best safeguard, the thieves generally manage to gain his confidence, and seduce his fidelity by gifts of sweet-meats and such-like dainties. If, as rarely happens, the road to the animal's affections did not lie through his stomach; if the dog was an honest dog, superior to bribery, and who refused to be influenced by such paltry considerations, the same appetising tit-bits presented the means of administering to him either a sleeping-potion or a permanent quietus.

But though robberies are common enough in cantonments, the camp is the great harvest-field for rogues. So many opportunities are afforded while marching, so many things left scattered about, and a tent is so much easier to enter than a bungalow, that a regiment or detachment seldom make a march of any length without suffering from their depredations; but how these opportunities occur, and how they are taken advantage of, may best be illustrated by giving the details of a few occurrences on the line of march.

In most native infantry messes, it is the custom, when beginning a march, to pack up all plate, glass, crockery, &c., only leaving out enough to serve up the tables on. Every officer is expected to bring his own plate, spoons, forks, and chair. The general dinner-hour was just as it grew dusk, and at sunset

each servant carried the requisites for his master to the mess-tent, and placed them in their allotted position. One evening, just before the first dinner-bell sounded, a thief watched the opportunity of the mess-tent being empty, and coolly walked into it on the opposite side from the cook-house, where all the servants were congregated. He passed within two yards of a sentry in doing so, but no one hindered him, taking him for what he appeared, an officer's servant. He then went round the table, appropriating every silver article thereon, judiciously rejecting the plated ones; and having made all up a compact bundle, deposited them in the folds of his *dhoti* or waistcloth; then hearing a coming footstep, he emerged as deliberately as he entered. Fortunately it was the mess-bearer who entered, and he, comprehending the nature of the mischief by a glance at the despoiled table, did what natives invariably do under all circumstances of excitement, *namely*, it be joy, sorrow, fear, surprise, or anger—*namely*, he made a great uproar. The rest of the servants joined in the chorus, like a pack of jackals when they discover a bone, and soon the camp resounded with the cry of 'Chor, chor!' (Thieves, thieves!)

The robber, with the missing articles in his elaborate for breeches pockets, had by this time reached the outskirts of the camp, and had actually passed the line of picket-sentries, when the cries, of which he well knew the cause, struck upon his ears. Had he conducted the rest of his proceedings as deliberately as his former ones, the chances were ten to one he would have got clear off with his booty, to chuckle over the stupidity of the Feringhees and their followers; but conscience makes cowards of pagans well as Christians. Anxious to gain the friendly shelter of the neighbouring jungle, he quickened his pace to a run, which attracted the attention of a *classe* (tent-pitcher), who was busily engaged in making tent-poles from the wood of a *bahul tree* (*Mimosa Arabica*), near the spot. Guessing at once that this was the individual who had caused such commotion in the camp, he applied the thick end of one of the tent-poles to his pericranium with such emphasis, that the thief bit the dust. The shock loosened the bundle he had deposited in his *dhoti*, and out rolled spoons, forks, ladles, &c., in an admired disorder.

The sudden and unexpected appearance of these articles gave the *classe* ample proof of the nature of the crime which had been committed, and he stood over the culprit, brandishing the axe with which he had been pointing the tent-pins, and shouting for assistance, which speedily arrived, and the man was carried off to the quarter-guard. While on his way thither, one of the servants identified the clothes worn as his own. They had been made up in a bundle along with some other articles which had been stolen some nights previously off his master's baggage. The culprit was tried by the civil powers, and rewarded for his misdeeds with twelve months on the road.

At some halting-places, a most barbarous and atrocious practice prevailed of poisoning horses for the sake of the hide. The poison was made up in a ball of *gud* (coarse sugar), of which horses are very fond, and thrown into their grass whilst feeding at their pickets. The animal soon sickened; and when the troop marched off next morning, was left behind dead or dying, and the rascally *chomars* (leather-drummers) obtained what they wanted.

Cawnpore is celebrated for its manufacture of saddlery, harness, &c., in imitation of English orders of the same kind. They do not last long, and have a disagreeable smell; but being very cheap, meet with a ready sale. In consequence, leather is in great demand there, and the first halting-place, about seven miles north-west of the station, for a long time occupied

a most unenviable notoriety for poisoning horses. The practice has of late years been almost entirely discontinued, and was for a long time checked by the device of an officer, who, enraged at the loss of a favourite charger, determined to punish the authors of its death. He pretended to march off with his regiment, but returning by a circuitous route, he concealed himself with several men near where the body of his horse lay. In due time, the choomars thinking the coast clear, came to skin the dead animal, when the ambush set on them with sticks, and thrashed them till they were tired. They then, with the choomars' own knives, hacked the skin so as to render it useless; and before they had time to raise the neighbouring village, decamped to join their regiment, with the happy internal consciousness of men who had done a good action.

Every nation has its own code of morals, and its peculiar ideas on the subject of honesty. The Highland cateran was looked on as a gentleman, provided 'he never lifted less than a drove in his life.' We frequently see instances of men who consider imposition justifiable in matters of horseflesh, which they would repudiate in any other. The most lax notions of honesty are generally prevalent regarding the ownership of umbrellas and walking-sticks.

The natives of India have perhaps more strange notions on these subjects than any other people. A murder is not a murder if committed on behalf of their faith, or to protect the honour of their family. A lie is not a lie if told to a Christian on behalf of one of their own creed. Many vagabond good-for-naughts are highly respected, while honest tradesmen are looked down upon. A tailor is looked up to, while a shoemaker is despised. A man may become a beggar or a cow-herd without falling in public estimation; but he would be eternally disgraced if he carried a burden on his head, or took charge of swine or poultry. A Parsee will cheat and overreach you in the most unscrupulous manner, but nothing would induce him to give you a light for your cheroot. A sepoy that may be trusted with untold gold, will steal firewood and sugar-canes whenever and wherever he can lay hands on them. What is a virtue in one caste, is a crime in the eyes of another. But all classes agree in their universal hatred of the professed thief. Whenever one is caught, he is abused, reviled, and maltreated in every possible manner. If caught in the lines or camp of a regiment, every man, woman, or child belonging thereto considers it laudable to give him a box, blow, kick, cuff, pinch, or some similar demonstration of good-will. At Benares, several years ago, a thief caught in the lines of a native infantry regiment was actually pommelled to death in this manner; and the same thing very nearly occurred in my own regiment, when this *summa jus* had well-nigh proved the *summa injuria* to an innocent individual.

One night, while marching in the upper provinces, the mess *khansamah* was robbed in the most artistic manner. He occupied a small tent called a *shouldarry* on the right, immediately in rear of the grenadier company—the other occupants being his wife and two children. While all were fast asleep, some cunning rogue effected an entrance by cutting a slit in the side of the canvas, and not only stole a bag of cooking utensils and some other small articles which lay scattered about, but also succeeded in removing the silver necklace and armlet of one of the children. How he was able to open the fastenings of these in the dark, seems almost incomprehensible, as the necklace required considerable pressure to unclasp it, and the armlet was fastened by a screw; but the probabilities are, that the thief had reconnoitred the localities by daylight, and, under pretence of playing with the children, had loosened the fastenings so as

to render their removal easy. When the *khansamah* awoke to a consciousness of his loss, he fancied it had only just occurred, and that the thief had not had time to escape, although, from subsequent inquiries, it seems most probable that he had got clear off some time previously.

He accordingly shouted 'Chor, Chor!' until the entire camp was astir. 'Where is he? In which direction?'

'Gone to the right,' was the reply; and a number of sepoy and camp-followers started off in the direction indicated.

Foremost of all was an unlucky *gareewan* (hackery-driver), who, in his zeal to capture the robber, kept ahead of all the others. This gave him the appearance of running away and being pursued by the others, so, as he rushed past the picket-sentry, the latter tripped him up, and he fell heavily to the ground.

Before he had time to rise, he was assailed by a number of the pursuers, who, without further preamble, began to execute summary justice on the supposed robber. In vain he protested his innocence, and declared he was no thief. His cries were unheeded, probably unheard in the burst of clamour and execration which surrounded him. He probably would have fared even worse, but the patrol coming up, rescued him, and carried off the poor wretch bleeding, and almost senseless, to the quarter-guard, where the truth soon became manifest, and apologies were tendered to the *gareewan* for the ill usage he had suffered. The men afterwards made him some small present by subscription, and the *bunneaks* put him on the free-list of their shops for as much grain as he could eat till the end of the march, which proved a more satisfactory balm to his wounded feelings than any expressions of regret could have done; and the poor fellow seemed as if he would not mind taking another thrashing to get into such good quarters again.

While my regiment was stationed at Meerut, I took the opportunity of parades and drills being excused in consequence of the inspection of another regiment quartered there, to give myself and my horse some exercise. It was a cold bracing December morning, for there is such a thing as cold weather in the North-west Provinces, and though the thermometer seldom falls below forty-three degrees, it appears quite cold to those who for eight months in the year are accustomed to double that temperature. There is something peculiarly refreshing and invigorating in such mornings; the energies which have been dormant during months of lassitude and inaction, appear to awake with redoubled vigour after their long repose, and men and animals seem to feel the effect equally. My horse and myself being of the same opinion, indulged each other's inclinations. Going along at a slapping pace, we soon left cantonments far behind us. Proceeding in this way, I overtook Swanton, one of our married captains, who said he was going out to meet Dod and his wife, whom he expected to rejoin from leave that day, and take up their quarters with him until they had time to get a bungalow for themselves, and asked me to join him. Adolphus Dod was our senior lieutenant, and had for many years held the situation of interpreter and quarter-master. A brevet-captain and regimental subaltern of eighteen years' standing, the slowness of promotion had given him an excuse for grumbling, which he improved on all occasions. He was a steady, conscientious officer, and excellent linguist; and his long service, and intimate acquaintance with the language and habits of the men, gave him a good deal of influence with them and the commanding officer. Being of an unsociable, and close, almost penurious disposition, he was not much of a favourite with the intermediate ranks; and we did not scruple to amuse ourselves at the expense of his

foibles. He had an idea that the gentility of a name should be admeasured by its length, and that its brevity was a symptom of plebeian extraction; he was therefore as much ashamed of his patronymic as he was proud of his Christian name. We youngsters used to irritate him exceedingly by writing chits and letters to him on any and every occasion, superscribed with his rank, titles, and prenomen, in as large characters as our space admitted, and his cognomen as minute as our penmanship could effect, without being illegible. The direction usually ran thus: 'Lieutenant and Bravot-captain, Interpreter and Quarter-master Adolphus Dod.'

A gracious response was seldom accorded to those minutiae; but as the contents were always strictly polite, there was nothing to lay hold of, and Dod chafed not the less because he chafed in silence. Not wishing to lose his staff allowances, he had not taken leave for many years; but during the previous rains he had suffered so severely from intermittent fever, that the doctors, much against his will, sent him to Simla for three months, where he soon recovered. There is no occupation to be found by the sojourners at that sanatorium to consume their spare time, except love-making and gambling. Too prudent to indulge in the latter, he fell a victim to the former, and surrendered his liberty to a young lady of the florid and globular style of beauty, whose appearance suggested to every reflective mind the idea of a milk-pail. Perhaps, as people always fancy their opposites, he loved her for the contrast she presented to his own tall raw-boned person, from which the sun seemed to have dried every ounce of superfluous flesh, making him a perfect cab-horse beauty, all bone and sinew. At any rate, he made her Mrs Adolphus Dod, and proceeded with his bride to rejoin the —; and it was for the purpose of meeting them and receiving the stranger with due honour, that Swanton and I were casting along the northern road from Meerut.

After proceeding a little distance, we saw some one riding towards us, whom I took for a very seedy-looking sepoy on horseback, and would have passed on without pulling up; but Swanton recognising Dod's splendid gray charger, exclaimed: 'By Jove, that's Selim, and Dod himself on his back; but did you ever see such a scarecrow? The man must be mad to go about masquerading in such a trim this chilly morning.' The figure which now presented itself to us was attired in a sepoy's red coat and pantaloons, which had evidently been made for a very small man, whilst the wearer was six feet two with his boots off. Consequently, the trousers did not go down low enough to hide the want of stockings, or come up high enough to get within hail of the waist of his scanty coat.

To fill up the intervening hiatus, he had tied one of the servant's cummerbunds round his waist, the variegated ends of which hang down in front apron-fashion, where, to say the truth, they were much needed. The coat, which could not be induced to meet within several inches, was fastened in front with bits of string, and the narrowness of its back gave him the appearance of a person in a strait-waistcoat. Round his neck, in lieu of neckcloth, were the voluminous folds of his eyee's *pogras* (turban), once a bright rose colour, but now showing signs of long and hard service, in many a greasy mark and unctuous stain. On his head was a hat, we had often seen him wear under happier circumstances; it was a white felt, something between a steeple-crown and wide-awake—on the elegant and unique appearance of which Dod used to pride himself; but now its glory was departed: it was saturated with some dark fluid; the leaf hung down limp and crumpled, and the crown

was bulged into the shape of the crater of a volcano. His sallow face looked blue; his teeth chattered; and his bare feet, thrust into yellow native slippers, shivered in the stirrups from cold. He appeared a crest-fallen and miserable, that we endeavoured to suppress our laughter; but when he proceeded to recount his sorrows, the whole affair, and the narrator in particular, looked so absurd, that human gravity could stand it no longer, and we laughed long and loudly, to his infinite disgust. Dod's account was unconnected and mixed up with various unimportant expressions, that I must give a version of his story in my own words. It appears he had two tents; one for sleeping in, the other for use during the day. The latter was always sent on overnight, so as to be ready pitched on their arrival at the new encamping-ground. He had with him the usual number of servants, and a guard of a sut and four sepoy, for the protection of his baggage. After dinner the previous evening, the large tent had been struck as usual, and sent on ahead, along with all their baggage and wearing apparel, except the garments they were to wear next morning. The sut and three men of the guard also went on, leaving an sepoy behind in charge of the smaller tent. Early rising and long marches produce sound slumbers; and whilst Captain and Mrs Dod, with the few servants left behind, were far away in the land of dreams, our reckless rogue managed to effect an entrance into their tent, and made a clean sweep of its contents. When Dod awoke at daybreak, he groped about for his nether garments, but not being able to lay his hands on them, called for a light. When it came, the appalling truth, in all its naked horror, burst on his benumbed senses. Every individual article of wearing apparel, masculine and feminine, had been carried off; nothing had escaped the fangs of the harpies except the lady's riding-hat, a very spicy affair, with a drooping feather, but rather unsuited to her *petite toilette de nuit*. Poor Dod was cleaned out, and he at length bethought himself of the sepoy's coat and pantaloons, which he proceeded to don, while his wife, wrapped in blankets like an Indian squaw, buried herself in the depths of her pillow; and lay out on their march until we met them, as already described.

We turned our horses' heads to accompany Dod back to cantonments, who, being shy of making an extraordinary appearance in public, proposed that we should go round to avoid the main thoroughfare. Swanton assented, but I thought there was a mischievous twinkle in his eyes as he did so. We accordingly turned aside from the road, crossed a plain, then through several lanes, and into a large mango grove. As we passed through this, the pace became a sharp gallop, and we emerged on the brigade parade-ground, where the 76th native infantry were being reviewed. Dod tried to pull up, but Selim was not to be outstripped by his neighbours, and never stopped till he arrived at the saluting-flag, amidst a group of carriages and equestrians, just as the 76th advanced to the general salute. All eyes were turned on the grotesque figure of our companion, whose countenance, now inflamed with rage and shame, made his other charms more conspicuous. He seemed doubtful for some time whether to knock down Swanton or make a bolt for it, but finally chose the latter, and rode off amid roars of laughter.

How different a reception was this from what Dod had pictured to himself. He had intended making a triumphal entry, a kind of matrimonial ovation; but here was he the laughing-stock of half the station, whilst his lovely bride was ignominiously compelled to hide her confusion, and conceal her scanty drapery, in the deepest recesses of a palanquin.

Within a year after this, Dod was promoted, and

left the regiment for an appointment on the general staff, to his great delight, for he never got over his discomfiture on this occasion, or forgave Swanton for the trick he had played him.

SHALL WE MAKE THEM 'COME IN?'

In Scotland, where Burns is read as well as sung, and where stately hospitals stand frequent monuments of the desire of a nation to learn as well as to teach, the difficulties which obstruct the education of the poor in England can be scarcely estimated. Not only are the hands of the legislature hampered by innumerable sectarian animosities whenever it attempts to deal with the question, but the people themselves are in most cases far from anxious for this boon of Universal Instruction to be granted. That, in the agricultural districts, the Employers—such is their wisdom—are often avowedly indisposed to allow their work-people 'to be made dissatisfied with their condition in life, by book-learning,' is true enough; but in the manufacturing counties it is the Employed, the Hands, who are found to have even a stronger objection of their own to the schoolmaster in any shape being sent among their children.

Yet, it is not too much to say, that, next to sanitary measures, next to the absolute necessity of improving the dwellings of the poor, this education of the mass of the people is the most pressing need of our social system. The machinery which is already working to that end is, indeed, of trifling power in comparison with the work required of it; but even if it were of ten times the force, the raw material, the to-be-instructed, would not be forthcoming any the more. Even as it is, the supply of schools, in many places, exceeds the demand; let church schools, dissenting schools, secular schools, what schools you will, be multiplied to any extent, and still we shall find, as we find now, that *the children don't attend them*. Even if the political zealots should agree—of which there is no reasonable hope—to sink their differences in the common good, and the political economists should waive their objections to a comprehensive scheme of government education, the scheme, nevertheless, would fail as matters stand, inasmuch as those whose good it contemplated would not accept the benefit. They might have the fruit of the tree of knowledge brought to them, but they would still decline to eat.

Such being the state of the case, a pamphlet bearing this title, *A Plan by which the Education of the People may be secured without State Interference or Compulsory Rating, and in Strict Accordance with the Principles of Civil and Religious Liberty*,* seems attractive enough; and its contents, we are bound to say, without pledging ourselves to all the author's sentiments, are scarcely less fair-seeming than the outside.

One point which Mr Wrigley—who is himself a manufacturer employing a vast number of work-people—insists upon mainly, and the one which seems to us also to need to be particularly urged, is this, that the interests of parents and child are, in the case of the poor, directly opposite and inimical to one another. You cannot persuade the father that that which takes money out of his own pocket, or which at least prevents money from getting into it, is for the good of his offspring. Even if the infant be sent to school at all, it is taken away to make money as soon as it can possibly earn any; and this so universally, that the average time that children in a manufacturing district remain at school is—according to the Report of Her Majesty's Commissioners—*less than a twelvemonth*. The smallest gain to be made out of a child's labour is found sufficient to tempt the selfish parent to take

away from it all the advantages of education. We are far from being so pharisaical as to expect, where there is an absolute necessity for more money, any great moral sacrifice of this kind on the part of the poor; and we are only referring to well-to-do work-people in ordinarily good times, or, in other words, to the majority of the manufacturing classes. Even in districts where the wages average only 12s. a week, 'the working-man,' says one of the Reports, 'not unfrequently spends one-sixth of that sum per week in beer and tobacco;' and when the wages are higher, the waste is found to be proportionally far greater. Mr Watkins, a school-inspector for York, Durham, and Northumberland, in 1850, estimates the yearly cost of elementary education at from 14s. to 16s. a year, or 4d. a week at most.

Surely where wages are good, this would not be a very severe exaction; and where they are bad, the pamphlet proposes a special plan for gratuitous instruction. But in the first and general case, how is the workman to be induced to save the necessary 4d. for this purpose?

'I earnestly plead,' says Mr Watkins, after describing the causes which take ninety-five poor children out of a hundred away from school before they can possibly be benefited, 'for the solemn voice of the law protecting the child from parent and employer alike.'

The intelligent writer whose letters, signed 'A Nottinghamshire Clergyman,' we are familiar with in the columns of the *Times*, expresses himself thus: 'In my own parish, where we have a trained master, there are but three months in the year when there is any tolerable attendance. With the opening of spring, every child in the parish is called away to bean-dropping; that over, the school begins to fill, when, in a few weeks, it is again nearly drained by the osier-peeling; then comes weeding, hay-making, harvest, and finally hop-picking, so that until November comes round again, we have no certain or regular attendance of scholars, and the main body have had time to forget all they have learned. Nothing better illustrates this than the fact, that in one school in this district, with a hundred and forty scholars on its books, there were but five children last year for whom the capitation grant could be claimed; and in another of seventy, but two. *No increase in either the quantity or the quality of the education offered, will in any degree meet this evil, which proceeds from want of appetite, or rather from the greedy appetite for money.*' And he concludes with this remarkable statement: 'The only effectual remedy now, or at least the only one that can produce any speedy effect, is to make education in some shape or degree compulsory.'

These views, Mr Wrigley, who is a political economist and a radical, and not at all the sort of person to interfere with the civil and religious liberty of any man, most readily endorses. 'It is,' says he, 'the right of the child to be educated for its own benefit; and if, for the interest of society, it is necessary that it should be so educated, a clear right of interference is established in both cases.' Physical health in children is already insisted upon by the law in the case of vaccination, and why should not mental health be equally cared for? Among other propositions of which we have not here space to treat, but which seem to us to deal thoroughly with every branch of the subject, Mr Wrigley has this principal one: 'That, in order to secure the co-operation of all who are interested in the employment of infant labour, it is necessary to prohibit the employment of every child under a certain age, say eight to ten years; and that after that period, it shall only be employed on the production of a certificate granted by a public officer after examination, shewing that it has arrived at a certain standard of elementary education; and that a breach of this regulation shall subject both

* Manchester: Johnson & Rawson.

parent and employer to certain legal penalties.' This elementary education is to be given in the manner most pleasing to the parent; and upon this subject, after anticipating various other objections, he has the following: 'If there be one thing more than another that distinguishes this plan from all others, it is that it secures that which they are all aiming at, but fail to accomplish, whilst it successfully avoids the religious difficulty by which they are obstructed. It offers every facility for religious education, when it is desired, and at the same time preserves religious freedom untouched. The difficulty from the first has always been that the country would not sanction any scheme of general education of a merely secular character, and hence it became clearly impossible for the government to initiate any plan so as to meet the sectarian scruples of every denomination.'

The pamphlet, indeed, is full of interesting and suggestive matter, and its propositions are the more striking, that they emanate, as we see, from Manchester, where any unnecessary interference of the government is not apt to be popular.

THROUGH FIRE AND WATER.

I THINK I must have been born with a travelling mania, for, from my earliest childhood, travelling has been my delight; and destiny has so far seconded my desire, that I have been a traveller from my cradle. With pleasure I commenced a journey, with pleasure pursued it, and usually with pleasure ended it. I was never sea-sick, never land-sick, and, in my earlier travels, never home-sick, for all I loved were with me. The proverb says, 'A rolling stone gathers no moss,' and I am not in a position to deny its truth; but the traveller lays up a rich store of thoughts and memories that will gladden more than gold the evening of his days, and before his mind's-eye there moves an ever-changing diorama, bringing back to him the bright scenes of his youth with a vividness that gilds the gray hairs of his age.

My first travelling adventure of any consequence was in South Africa—and it now stands before me as distinctly as if it was but twelve days instead of twelve long years since I dwelt in the lighthouse-looking fort, perched on a rocky promontory overlooking the surging green sea of the Fish River bush, from which my red-coated companions and I kept close watch for the Caffres, who never came within sight of our telescopes. What a dreary and monotonous life I found it, despite the beautiful scenery that surrounded us, and the occasional *commandoes* on which we were sent out; and when, at the end of three months, I received orders to take command of another officer's detachment, at a post nearer to the frontier, how rejoiced I was, for I trusted that there a more soldierly life was in store for me, and I knew that, at all events, I should have the pleasant excitement of a journey.

There were two routes by which I might reach Fort Nash, the more circuitous of which was a wagon-track, while the shorter one was practicable only for horses; despatching my baggage and servant by the former, I set out myself on the latter, attended by a mounted rifleman, in the double capacity of escort and guide. And a tight Cossack-looking fellow was Steermann Dragoonier, in his green jacket and leather trousers, with his rifle slung by his side, despite his Hollandish appellation and the flat Hottentot features, half hidden beneath the peak of his shako. There was infinite intelligence and good-humour gleaming in his rat-like eyes, and the white teeth that shone forth from beneath his woolly moustache. Yet once or twice I could not help smiling at the idea of this being my protector, as I looked back at the little fellow, perched, monkey-like, on the back of his large

steed, following me so gravely down the steep rugged path leading to the nearest *drift*, or ford, across the Fish River. But as a guide he was invaluable, for I knew not a single foot of the way; and therefore, as soon as we reached the bank of the river, our positions changed, and Dragoonier, putting spurs to his horse, trotted on in advance.

Before us glided the river, filling almost to the brim its canal-like bed, for there had recently been rain among the mountains; while the rapidly rising tide was still further increasing its volume. Crossing the river obliquely, there was a line of broken water, rising occasionally into surges, which burst with a hoarse murmur, and lost themselves in the whirling eddies the opposing currents caused to froth immediately above. This line of breakers covered a ridge of rock, shelving irregularly on the lower side, and precipitous on the upper, its summit being our path across the river; a sufficiently perilous one at any time, for it is only during very low tides that the eye of the steed or his rider can see where the foot of the former is to be placed; but now, rendered infinitely more hazardous by the unusual depth of the stream and its increased velocity.

But with his usual quiet aspect, the Hottentot brought his horse to the brink, and the animal stepped into the water with a readiness which must have been the result of experience; for my own English-bred horse at first refused to follow his example, rearing and curvetting on the bank, as if resolved not to wet a fetlock. At length, considerable coaxing, and the sight of the troop-horse far in advance, induced him to enter, when he went picking his way cautiously along his unseen path, as if he knew the truth—that a single false step would send him over the ledge among the gurgling eddies which wrestled themselves almost within reach of my hand. But he betrayed no further repugnance to the foaming water, save now and then a snort when they surged up unpleasantly near his nose.

I had advanced nearly to the middle of the river, and had reached a part where the breakers were becoming larger, when a loud snort or puff, apparently close at hand, startled me, and sent my horse plunging almost over the ridge. I looked hastily round, but nothing was to be observed except what appeared to be an old shapeless boat, turned bottom up, coming floating down with the stream. Could that sound, I thought, be the smothered cry of some unfortunate being drowning beneath the overturned boat? and I spurred on my horse, hoping I might be in time to aid a fellow-creature perishing so near.

Another moment, and the old boat reached the ridge, and immediately, to my astonishment, began to rise above it, higher and higher, until there stood out in contrast with the snowy foam a large black head, garnished with two gleaming tusks. Both horse and rider stood still and silent with amazement, as next came forth the shoulders, and then the body and rock-like legs of an enormous hippopotamus, down whose wrinkled sides the stony bank, which the water had diluted without being able to wash off, rolled in inky rivulets, while the large creature pulled and panted as if wearied by the effort he had made.

I felt more astonished than alarmed at the sight of my new neighbour, for I knew that a meeting with a hippopotamus is rarely dangerous, if he is not meddled with; and I confidently expected he would shortly continue his route down the river. But, to my great discomfiture, he turned sharply to the right-about, so as to face me, and commenced his rolling march towards the shore along the very path in which I stood. My horse started back, neighing in affright, and became nearly unmanageable, while onward the monster came, splashing recklessly among the breakers.

Had I been on dry land, or in smooth water, I would have turned round, and fled without striking a blow in my own defence. As it was, I dared not venture on such a step, lest my horse should stumble and be swept down the river, with whose course and dangers I was unacquainted. The only plan, therefore, left me was to retire before the intruder as I would from the presence of royalty—that is, backward; and a very difficult matter I found it, for my horse was trembling with fear and anger, as he gazed with starting eyeballs on the immense creature before him, and restive at being forced backward along a path the dangers of which he knew, but could not see, and of which I myself could only guess the direction by the line of foam stretching before me.

Meanwhile, the new-comer, rolling lazily along, drew every moment nearer, yet still appeared unconscious of our presence, unless I was correct in fancying that there was a wicked gleam twinkling in his small sunken eye. How much force that thought added to the desire already boiling within me, to discharge my pistol into that sole vulnerable spot! But prudence deterred me, by reminding me how small was my chance of slaying my adversary compared with that of enraging him; and so, with the best grace I could, I retreated along the path I had found so difficult when advancing. But oh! when we reached the shallow water, and turning off, were able to dash along the bank, how wild a neigh of joy burst from my horse's lips—if ever there was an equine 'huzza,' it was that!

When my steed's mad gambols were over, and I had space to look round me, there was the hippopotamus rolling slowly after us. But he soon turned off towards the river, and let himself luxuriously down into a huge mud-pond among the sedge, breathing forth his satisfaction in loud grunts, that sent the birds fluttering off from the neighbouring trees.

Having seen the enemy thus safely disposed of, I returned to the drift, on the further bank of which Steermann Dragoonier was standing in evident astonishment, and once more essayed to cross the ridge. But scarcely had my horse entered the water, when I found the tide was now nearly full, and that he was compelled to swim. However, the animal's blood was up, and he made no difficulty, but breasted the rushing waters gallantly, cutting his way through them with the boldness and grace of a water-dog. It was well he possessed the energy and courage, for, as we got further into the stream, I perceived that, no longer opposed by the tide, the swollen current was running rapidly, and that we were unable to hold our way. Further and further down it swept us, despite my good steed's efforts and the encouraging cries of Steermann; and though we gradually neared the other bank, I began to think the passage of the Fish River would prove a more serious matter than I had anticipated, for the grassy bank was beginning to be checkered by patches of impervious jungle, which I feared would shortly prevail. But I need not have troubled myself; for the next minute my horse threw back his head, striking me on the forehead, and sending me reeling from the saddle.

When I recovered recollection, I was lying on the grass a little below the drift, and the first object which met my eyes was the dripping form of Steermann Dragoonier bending anxiously over me. My gallant little escort! he had thrown himself into the water, and at the risk of his own life saved mine. Brave-hearted Hottentot! how little he made of the deed, and how little he comprehended my gratitude, or the reason that made me thenceforth his fast friend. Meantime, left to himself, my horse had scrambled to land, and now stood with drooping head awaiting my recovery. But it was more than an hour ere I was fit for the wearying walk up the steep

hill which bounded the Fish River valley on the Caffreland side, where the rocks and stumps obliged us to lead our horses.

At length the ascent was achieved, and gladly we vaulted on our steeds to refresh our spirits by a canter over the level prairie, and make up in some measure for lost time. On we went, laughing to see the wondrous bounds of the springboks, or Cape antelopes, and the ungainly carriage of the ostriches, as they sped along in mortal terror at our appearance. At length some dark specks became visible at a distance on the plateau, but were soon lost again among the groups of trees that dotted the plain like islands in a grassy sea. I inquired of my companion whether they were hartbeests or gnus—two animals I had never seen.

'Dem Caffre, sur,' replied Steermann, drawing near; 'and dey got no pass.'

'How do you know?' I asked.

'Cos dey hide. Ah, de black tief come for plenty troubles,' ejaculated my escort, shaking his head with an air of experience.

Having no opinion to give, I held my peace, and rode quickly on, directing my course close by the green isles where the black specks had taken shelter, mentally resolving to inquire into the truth of the Hottentot's suspicions. As I drew near the groups of trees, the light feathery foliage of the acacias that composed them forbade the thought that they could conceal a Bushman, far less a party of stalwart Caffres. At last I approached one which the thickly clothed branches of the laurel and the wild plum rendered nearly impervious. Here, if anywhere, were the fugitives; and cantering round to the opposite side, followed by Steermann, I came on a party of four coal-black Caffres, crouched beneath the trees, each with his bundle of assagais laid close by his side.

Calling Dragoonier forward, through his interpretation I demanded to see the pass by which alone a Caffre was entitled to enter the territory between the Fish River and the Kelskamma, and then only unarmed. My trusty attendant had divined rightly, for there was no pass forthcoming, and the clumsy excuse they made of having lost it on the way, was too palpable; so, assuming an air of official dignity, I reproved them for being found in the neutral territory without a proper authority, and commanded them to return at once into Caffreland. But even while speaking, there came over me a sense of the ludicrous, in the idea that I with but the two rifle barrels of my escort at command—for my gun had been lost in the river, and my pistols wetted completely—should thus defy men, who had each, lying by their right hands, the price of five lives. Fortunately, the Caffres did not view the affair in the same light, but with an affectation of great humility, they gathered up their weapons and karosses, and departed across the flat, comforting themselves, probably, with the reflection, that any other moonless night would serve their turn as well.

Having arranged this business, I was at liberty to pursue my journey, though the tall grass among which we had now entered, reaching sometimes to our horses' knees, at others nearly to our own, was a great impediment to our progress. Owing to this, together with the long delay at the drift, night fell while we were still many miles from Fort Nash; the road was bad, too, and there was no moon, so we had nothing for it but to unsaddle beneath the nearest acacia patch. This necessity in so delicious a climate we should have regarded as no great hardship, had we only been provided with supper; but though many a buck and hare had crossed our path that day, we had been in too great haste to draw trigger at them: so our repast consisted only of a few biscuits and the contents of my hunting-flask.

But short-commons and fatigue appeared to have no effect on the spirits and energies of Steermann Draghooner, who bustled about as if all the duties of an establishment devolved on him—knee-haltering the horses, and turning them off to feed—gathering sticks and making a fire on a spot he had previously denuded of the tall, dry prairie-grass that covered the whole region—searching about to discover whether any birds or hares resided in our neighbourhood, or any ostrich-eggs had been deposited about; and though all his quests were fruitless, still, not losing heart, but whistling, as with a wisp of grass he rubbed down the horses before he tied them to a tree, to insure their being forthcoming in the morning. Long after fatigue and my river-adventure had made me glad to roll myself in my cloak, and making a pillow of my saddle, stretch myself on the soft, dry grass, I could see his dark form sitting in the fire-light; and every now and then, as I stirred in my sleep, the tones of his low, sweet voice, as he sang the long-drawn cadences of Dutch hymns, echoed in my ear.

At length the Southern Cross had mounted high into the heavens, the fire died out, and Steermann, wrapping himself in his cloak, lay down beside it. We must have slept for hours, when I was suddenly awakened by the loud neighing and stamping of the horses, and then I became conscious of a suffocating sensation, as though the sirocco were blowing over me, and covering me with its burning sand, and an impetuous rushing sound seemed filling my ears.

I sat up instantly, but the oppressive heat was still around me, and louder than ever was that strange sound, while the whole atmosphere seemed filled with a lurid glare. Calling on Steermann, I sprang to my feet, and looking round me, saw that we were enclosed by a wall of fire. On every side were long forked tongues of flame leaping up wildly into the air, or springing on the scattered acacia-trees, and wreathing them with their fearful beauty for a few moments, till they fell into the blazing sea below; for like billows of fire did the conflagration rage, rolling along with almost incredible speed, as the dry prairie-grass yielded quickly to its influence; while, above all, the deep, hoarse voice of the furious element rose in triumph.

Thus surrounded, my companion and I stood beneath the trees beside our struggling horses, while the hot thick smoke that now began to roll in volumes over us, oppressed our breathing, and confused our scarcely awakened senses; while the burning belt drew rapidly closer. It was a fearful moment, and we gazed on the scene around us in silent horror. Heaven grant that when death really comes, he may not come in that guise. Suddenly the Hottentot beside me cried in a sharp, bitter tone:

'Dem rascal Caffre, dey fire de grass all round—hope roast us like buck!'

'Then we can do nothing?' I said, roused from my bewilderment.

'Noting, sur; only die,' was the desponding reply. 'We got no wings to fly, and would need jump higher than springbok to jump dat fire. Oh, it hard to die while Caffre laugh!' he added bitterly. 'If me could only catch him!' and he raised his rifle menacingly, the next moment to throw it down in despair; then going over to his horse, he took his head silently between his hands, and leaned his own face upon it. The horse ceased its restless stamping: they were friends, that horse and man, and it seemed as if the fond caress brought comfort to the hearts of both.

But it is not in the nature of an Englishman to yield his life without a struggle to save it. I looked round. The onward roll of the fiery waves made the view a narrow one: I glanced at the trees above our heads, but the sight of one blazing not far distant reminded me that they too would share the general

destruction. Then I thought of the grass: could we not tear away sufficient—for men work hard when the wage is life—to permit us to stand in safety, though the flames raged around us? I made the attempt, but the strong wiry grass resisted; I only cut my hands. How bitterly, now when too late, I repented our want of caution in passing the night where there was no water; but our horses had drank half an hour before we stopped, and it was some distance to the next *vly*, or pond.

In such times, much both of thought and action is crowded into a short space. It was not more than ten minutes since I awoke, and already the flames had approached so near that I could feel their burning breath upon my cheek. It seemed as if the martyr's fate was close upon us, without the martyr's holy motive to bear us up. I felt I had not nerve to watch that fiery death advancing upon us fathom by fathom; I could better meet it in the bustle and hurry of action; and calling to Steermann to follow my example, I sprang on my horse's back, and putting spurs to his sides, galloped him madly at the flames.

On we went, through a body of living fire that rent our skins and burned our hair and clothes; on through a plain of burning stubble, that burned our horses' feet; on, with a speed greater than that of the fleetest racer, while our blazing garments flew on the wind behind us; on, on, until at length we reached water. And only they who have passed through a like fiery ordeal can tell with what delight both men and horses cast themselves into the cool element.

At last day broke, and, remounting our suffering horses, we rode on to Fort Nash, where we arrived so burned, blackened, and haggard, that none could recognise us; and it was many weeks ere any of us, biped or quadruped, recovered the effects of that momentous ride through fire and water.

ON THE PATH.

On the path toiling, I thought not of toil;
Troubles might meet us, I did not recoil;
Sunshine above us, but in our hearts more,
Rich in bright hopefulness, outwardly poor:
'Twas thus we started, thy hand clasping mine,
Thou my love owning, my faith built on thine.

'On the path,' saidst thou, 'together we'll keep,
Though it be thorny, love, though it be steep.
Alone one might falter, but we hand in hand
Strength each from each, love, can ever command.'
Yet I—the weaker—have held to the track,
Singly have reached the goal; thou hast turned back.

On the path, sadly and lonely I sped,
Silently, tearlessly, buried my dead;
One by one buried them out of my sight,
Deep in the heart that, near thee, was so light.
Hope with its blossoms all withered and shed,
Love, Faith, and Fellowship—these were my dead!

On the path still, but my toil is nigh done;
I've but to enter the home I have won.
Home!—what a word! but the name is too sweet
When the heart rests not, and the tired feet,
As o'er the threshold they wearily tread,
Raise by their echo the ghosts of the dead.

From the path stepping, too clearly I see
Not what is present, but what was to be:
From the dark grave where I laid them to rest,
The Love and the Faith that were dearest and best,
Like phantoms arise which the tomb cannot keep,
And I lose them anew, having leisure to weep.

PRICE 1½d.

A WEEK AMONG THE HEBRIDES.

FIRST ARTICLE.

EIGHTY-FIVE years ago, when Johnson, in following out a long-cherished wish, set forth on his famed journey to the Hebrides, his friends thought he was undertaking an exceedingly distant and dangerous expedition; and Boswell, his companion, on whose 'gaiety of conversation and civility of manners,' he relied for counteracting the inconveniences of travel, has told us that on his mentioning to Voltaire his design of visiting the Western Isles, the philosopher of Ferney looked as if he had 'talked of going to the north pole.' Nor were these apprehensions ill founded. Not to speak of the ordinary difficulties of land-travelling in Scotland in 1773, the islands, stretching at lesser or greater distances along its western coast, were reached only by small boats, requiring no little skill in management, or by casual sailing-vessels, by which the very limited trade of the islanders was conducted.

Now, what a change! Railways on land, and steam-vessels on the seas, have worked such wonders, that a journey which was terrifying eighty to ninety years ago, and even much later, can now be performed with perfect ease, expedition, and certainty. What occupied Johnson about two months, may now be performed in about ten days. What he actually saw in the Hebrides during three weeks, may now be seen, and to infinitely greater purpose, in three or four days, while, in point of cost, the comparison is equally in favour of the present modes of conveyance.

Accustomed, once a year, to make a run for a few weeks on the continent, I resolved that this summer I should confine myself to the attractive scenery of the Hebridean isles; and others, I doubt not, may be similarly influenced. The recent regulations and troubles about passports—things disgusting to an Englishman at the best—have set us all to consider whether, within the compass of the British Isles, there are not scenes as picturesque as the Rhine, as grand as the Swiss mountains, and in all respects as interesting, in a social point of view, as anything presented in continental travel. I am at all events hopeful that some little account of what I saw and heard of in a short excursion among the Hebrides, may draw the attention of tourists to a line of route as remarkable for striking scenery as for the comfort and security with which it may be pursued. To give some assurance on these latter points, let me endeavour, in the first place, to describe what may be called the *mécanique* of travel to and from the Western Isles.

Boswell and Johnson, it will be recollected, took a

tedious and painful route through a mountainous region from Inverness by Glenelg to Skye, which was the first island they touched at, by crossing a ferry in an open boat. Modern tourists have a choice of two principal routes—one by railway to Inverness, and thence along the Caledonian Canal, at the western extremity of which steamers are ready to take them to the islands; the other by the Clyde, the islands, and the Caledonian Canal, being just a reversal of the preceding. The plan we should recommend to tourists from London and the central parts of England, is to proceed by railway direct to Glasgow; there, going on board one of Hutcheson's steam-boats, they have no further trouble, being conveyed in a series of elegant floating hotels for hundreds of miles, stopping here and there every night to sleep at nicely furnished inns on the islands or mainland. This being done as far as wished, the tourist may finish off with the Caledonian Canal to Inverness, taking, if he pleases, some picturesque side-routes on the way home by Edinburgh. With Glasgow and the Clyde, the stranger cannot fail to be astonished—a great, populous, and prosperous city, the creation almost of the last seventy or eighty years, and a great navigable estuary made by enterprise and industry out of a very ordinary river, which was not long ago only fit to bear boats and gabbards, and now carries to the ocean large American steamers. Among the marvels accomplished by the people of Glasgow, none is more surprising than their steam-boat system. It was the Clyde on which the first steam-vessel was attempted in Great Britain; and since 1812, when Henry Bell made this memorable experiment, the Clyde has kept the lead both as to building and running steamers. Favoured by the profusion of these handy vessels, Glasgow may be said to have dispersed itself along the shores of the Clyde and its lochs nearly as far as the ocean. Stretching along the lower slopes of the hills, nestling in nooks, and perched on craggy eminences, are seen an endless variety of cottages, villas, and castles, the summer or permanent residences of a wealthy and comfort-loving mercantile community. From point to point, at which commodious piers have been thrown out, steamers may be seen plying at all hours of the day; so that, according to pleasure, you may travel about agreeably on the water from place to place—now running up a Highland loch, environed by rugged mountains, next skirting along a villa-ornamented shore—and so seeing and enjoying a vast deal in a day at a most insignificant outlay. Of course, this immensely convenient system of steaming attained comparative perfection on the Clyde before it was

extended to the western islands; and but for the enterprise of one individual, to whom the world owes something, it would in all probability not have yet gone that length—at least to an extent worth speaking of. I allude to David Hutcheson, one of the remarkable men of his time, who lives to enjoy the reputation of having opened up the Hebrides to a course of modern improvement. Mr Hutcheson's life, like that of Bianconi in Ireland, shews in a particular manner what one thoughtful and energetic man may do to advance the interests of his country. A notice of his projects embraces little else than an account of the existing Hebridean organisation of steamers.

Beginning his commercial life about forty years ago as a junior clerk to one of the earlier steam-boat companies on the Clyde, Mr Hutcheson was afterwards for many years connected with the firm of J. and G. Burns, a large shipping concern in Glasgow and Liverpool, and principal proprietors of the Cunard ocean steamers. Among other places on the coast, Messrs Burns sent steamers to the Western Isles; but this branch of their trade, it seems, did not pay, and was willingly resigned to David Hutcheson, who had formed his own opinions on the subject. With an enthusiastic, and we should almost say a poetic, admiration of the West Highlands and Islands, and desirous not only to make tourists acquainted with their scenery, but to develop the resources of their immeasurable solitudes, he entertained the notion, that by giving large and finely appointed steamers, and doing everything on a liberal scale, the intercourse with the Hebrides might be established on a solid and prosperous basis. Animated with this idea, he began his operations about 1851, assisted by his brother, Mr Alexander Hutcheson; and latterly, the firm of Hutcheson and Company has included Mr D. Macbrayne, a nephew of the Messrs Burns.

Passing over Mr Hutcheson's initiatory attempt to establish an enlarged traffic between Glasgow and the Highlands, we come to what more immediately concerns tourists—the present arrangement of his steam-boats, which is in peculiar adaptation to the nature of the waters to be traversed. Looking at a map of Scotland, we see that the long peninsula terminating in the Mull of Cantire cuts off the lower part of the Clyde from any ready access to the western coast, but that to accommodate the transit of small vessels, the Crinan Canal has been formed across the neck of the peninsula—this very useful canal, about nine miles in length, commencing on the east at a place called Ardrishaig on Loch Fyne. Carrying the eye northward on the map, we perceive that, having got into the western sea and as far as the top of the Linnhe Loch, a transit can be made by the Caledonian Canal to Inverness. Now, independently of sea-going vessels to go round the Mull, here are several kinds of vessels in requisition to sustain the intercourse of a line of route which is awkwardly broken into distinct parts. All, however, is provided for. The Hutchesons possess altogether twelve vessels of different classes, consuming in the aggregate per annum 24,000 tons of coal, which for convenience are placed in dépôts at various leading ports.

To begin with the largest in this effective fleet, we have the *Clansman* and *Stork*. These are strongly built for sea, broad in the beam, and with powerful engines—that of the *Stork* having a power of 220 horses. Both are fitted for carrying goods and passengers; and as a night has to be passed on board, they can each make up fifty sleeping-berths in separate cabins and on sofas. One of them leaving Glasgow every Monday and Thursday, proceeds round the Mull of Cantire, calls at Oban, Tobermory, Portree, and other places, their regular destination being Stornoway in the distant Lewis. They, however, make more extended calls beyond Stornoway; as, for example, Lochinver on

the mainland, a favourite residence of the Duke of Sutherland and family, likewise Ullapool, and Gairloch in the western part of Ross-shire. Over this wide range they ply unitedly from March till November, and one alone plies once a week in winter. Twice a year, for the special accommodation of herring-fishers, they go round the north of Scotland to Thurso. Unless one were to visit the strangely indented west coast and islands, he could scarcely realise the importance of these voyages of the *Clansman* and *Stork*, which, after passing Islay and Jura, pursue first a sinuous course through the Sound of Mull; then rounding the extremity of Ardnamurchan, enter that narrow and intricate channel between the mainland and Skye called the Sound of Sleat; lastly issuing into the more open Minch, they take a route direct for Stornoway—throughout their long and devious course among the islands, landing and taking in passengers and goods, and, as it were, sowing the seeds of civilisation and prosperity in places which, but for their periodical visits, would be as difficult to reach as if situated in another hemisphere.

The next class of vessels to which we may draw attention, are those steamers of handsome structure, sharp in the bows, and of light draught of water, which are designed exclusively for passengers on the route from Glasgow by Ardrishaig and the canals to Inverness. This continuous line, as already mentioned, is effected in several stages. The first part of the journey is performed from Glasgow to Ardrishaig by means of the *Iona*, a vessel which I should imagine to be unmatched for its elegance and speed. Built in 1855 by J. & G. Thomson, of Glasgow, at a cost of £10,000, this beautifully moulded steam-boat, measuring 234 feet in length, with 21 feet breadth of beam, draws only 4½ feet of water, along the surface of which it skims with a rapidity of nearly nineteen miles per hour. As to its remarkable speed, of which I can speak from some experience, it is said that it has more than once run between the Cloch and Cumbrae light-houses on the Clyde, a distance of fifteen miles and two-thirds, in 47½ minutes; and it may be doubted if a like velocity has been attained by any steamer of its dimensions in Europe. With the rate of speed reached by American river-steamers, it is unnecessary to make any comparison; for where the safety of lives is of no importance, and disaster incurs no obloquy, vessels can be urged to a degree of velocity alike excessive and dangerous.

The *Iona* is propelled by two oscillating engines, one working on each side of a fixed exhausting cylinder—an arrangement which secures a certain ease of motion; and this latter quality is further promoted by the use of patent feathering floats on the paddles—that is to say, each float, after making its propulsive stroke, rises slopingly and with the least possible resistance from the water. The smoothness of action, along with a certain saving in force effected by this peculiar process, would render its adoption very desirable for ocean-steamers, but for the risk of derangement. The feathering requires a good deal of mechanism intermixed with the floats, and were any part to break while a vessel was far at sea, the result might be serious; whereas an accident occurring on the Clyde or west coast could be easily remedied. Strength and security are matters of prime consideration in building British sea-going steamers; speed and easiness of action being properly of secondary importance.

In point of interior fittings, the *Iona* is likewise entitled to be called a crack boat. The long open deck is furnished with an abundance of cushioned forms and chairs, and the saloon is decorated in a style of great comfort and elegance—ranges of seats covered with red pile velvet, long mahogany tables, mirrors and gilding, along with appointments

in the steward's department as good as at any first-rate hotel. A health-seeker and gourmet might do worse than to live for a week or two in the *Iona*, travelling daily up and down the Clyde, inhaling draughts of fresh air, seeing beautiful scenery, feasting on salmon so fresh as still to retain its creamy curd, and on herrings caught only an hour or two ago in Loch Fyne—herrings *par excellence*, for in comparison all other creatures of this species are next to worthless. I may here add once for all, that not only in the *Iona*, but in all Hutcheson's vessels, particular attention is paid to the alimentary departments. These, indeed, are conducted by the respective stewards on their own account, but according to certain terms as to quality and charge; and the good principle is followed of allowing no gratuities to be asked or taken by any one whatever. The usual charge is 2s. for breakfast, and 2s. 6d. for dinner; at each meal, besides the ordinary fishy delicacies, there being a profusion of dishes, and water with ice. Least any one should be impatient for an *Iona* breakfast, I should explain that it is not served till a few minutes past nine o'clock, when the vessel has taken on board passengers at Greenock. Starting on its trip from the Broomielaw at seven, passengers have two hours to grow hungry, which they never fail to do; and the sight of Dumbarton Castle in the foreground, with Greenock in the distance, is for the most part looked for with an interest unconnected with the history of these places. Those who do not choose to encounter this salutary hungering process, start by rail an hour later from Glasgow, and come on board at Greenock just as the steward's lads are carrying the hot dishes from the cooking-house to the saloon.

On board and breakfasted, the tourist complacently lounges on the deck, either skimming the morning's news in the *North British Daily Mail*, which he buys from a boy with a basket of books and papers, or gazing delightedly on the ever-shifting outlines of the Argyleshire hills. Touching at Dunoon and Inellan—populous villa-towns of yesterday—next, running into Rothesay in Bute, celebrated for the amenity of its climate, and then proceeding through the narrow zigzag channel known as the Kyles of Bute, the vessel at last reaches Loch Fyne. Up this arm of the sea it goes, detaching at Tarbert a boat-load of passengers, who design to cross the peninsula in order to reach Islay by means of a separate steamer; and at a distance of about twenty miles from the mouth of the loch it arrives at Ardrishaig—a village consisting of a few houses and a hotel. Here, about one o'clock, all quit the *Iona*, and walking one or two hundred yards, they get to the banks of the canal, where lies a pretty track-boat called the *Sunbeam*, which the Hutchesons keep for the convenience of their passengers. Drawn by three horses at a smart trot, the *Sunbeam*, with its load of passengers and luggage, glides smoothly and silently along the canal, that winds among craggy knolls, overhung with hazels, ferns, and wild flowering plants, and offering at various points glimpses of residences of Highland gentry; the more imposing of these seats being the princely mansion of Portalloch, which is said to have cost as much as £100,000. As the *Sunbeam* is necessarily detained at the several locks, the time spent in the transit is fully two hours. If the weather be fine, many prefer walking a few miles. On arriving at the western extremity of the canal, we have before us an inlet of the sea, with a pier, at which lies hiasing the *Mountaineer*—a steamer bearing a close resemblance to the *Iona*; its only difference being that it is not quite so long, and is otherwise better adapted to pass through the seas which surge along the western coasts. The transference of passengers and baggage to the *Mountaineer* occupies but a few

tourists are usually somewhat nervous, they may keep themselves quite at ease, for at each end of the canal it is shifted in attendant carts and trucks by properly appointed servants of the company; everything, including boats, carts, men, and horses, forming part of an apparatus which has for its exclusive object the forwarding of passengers with the smallest degree of anxiety or trouble to themselves. For those who may prefer riding from end to end of the canal, there are always Highland cars, open and covered, in attendance for hire at Ardrishaig. Matters are so arranged that passengers brought by the *Sunbeam* from the west find the *Iona* on their arrival, and ordinarily, therefore, on the small quay of Ardrishaig there are for a few minutes two contending floods of people—one streaming out of, and the other into, the *Iona*. It is further arranged that that very important affair, dinner, takes place in the *Iona* while passing homeward down the comparatively tranquil waters of Loch Fyne, and in the *Mountaineer* while proceeding up the Sound, which is bounded by the islands of Scarba and Linga on the west, and Luing and Shuna on the east.

By the time that dinner is over, the lofty peaks of Jura are sinking in the horizon; the *Mountaineer* is now ploughing her way past Seil, on the right; and on the left, are seen towering the gigantic mountains of Mull, one of the largest of the Hebridean isles. Holding on with an inclination towards the east, the vessel nimbly passes into a narrow sound, bounded on the west by the rugged but green island of Kerrera; at length, about five o'clock, it steams into the beautiful land-locked bay of Oban; and the traveller has reached what is yet only a pretty village of good white-washed houses, but which, from its favourable position and mild climate, must eventually become the metropolis of the west Highlands and Islands.

Oban, of which more shall be said afterwards, is a favourite centre-point for tourists, who wish to make a trip in any direction—to the islands of Iona and Staffa on the west, Skye and Lewis on the north, Inverness on the east, and also in an easterly direction, the vale of Glencoe, Loch Awe, and a number of other places celebrated for their singularly grand scenery, as well as their connection with the stirring events of history and tradition.

After calling at Oban, the *Mountaineer* proceeds up the Linnhe Loch, by Fort-William, to Corpach, where it arrives the same evening. Passengers immediately transfer themselves to a spacious omnibus, luggage is put into two vans, and the whole, in less than half-an-hour, reach Banavie, where they remain for the night. Tourists to whom time is of importance, or who habitually rush past everything, as if that which was worth seeing is still somewhere further on, place themselves next morning in one of Hutcheson's vessels, kept for the passage of the Caledonian Canal, and so at once get forward to Inverness in the afternoon of the same day. Others, more considerate, make a short stay at Banavie or Fort-William, to visit, if not to ascend, Ben Nevis, to see the ruins of Inverlochy Castle, to visit the parallel roads of Glenroy, or to make a trip of a few miles along the banks of Lochail to Glenfinnan, where the unfortunate Charles Stuart first planted his standard in 1745.

Reverting to Oban as a general rendezvous for tourists planning Hebridean excursions, it needs to be explained that to afford scope for sight-seers the Hutchesons station here a third vessel of their swift class, the *Pioneer*, which on certain days proceeds to the highly interesting islands of Iona and Staffa, and on others to Loch Leven—a branch jutting inland from the Linnhe Loch—at the upper extremity of which vehicles are in attendance for a trip to

may return by the same vessel to Oban, or choosing not to be in a hurry, they can stay at the hotel at Balahulish, and be taken up by the *Mountaineer* next day, on its way to Fort-William and Corpach. Let it further be remembered that, if after excursions among the Hebrides, one wishes to return direct through the Highlands to Loch Lomond, and adjacent districts, he has a stage-coach from Oban quite at his service.

Having expatiated at such length on Hutcheson's system of tourist-steamers, it seems only necessary to add, that as these beautiful vessels are employed chiefly in summer, his organisation is completed by the running of two steam-vessels of lesser size, the *Cygnets* and *Lapwings*, which go through the canals and ply with goods and passengers to and from Inverness during the whole year. They are a smart and well-found craft, with comfortable sleeping-berths; they touch at Oban and other places, and by their agency a constant intercourse is kept up with Glasgow and the northern parts of Scotland. We do not need to particularise the more circumscribed steam-system of the Hutchesons in connection with Inverary; it will be of greater public interest to state that, by their means generally, in co-operation with other causes of improvement, an extraordinary impetus has lately been given to the establishment of new mail-routes, light-houses, buoys, and beacons; the plantation of villas along the shores of the Highlands, and, above all, the extension of hotel accommodation for tourists.

A resident in the south, who probably pictures the Highlands as little better than an unmitigated wilderness, can hardly by any force of description be brought to understand that at Dunkeld, Inverness, and Oban, he will find hotels about as extensive and magnificent as those at Euston Square and Paddington—very much better than the generality of hotels in the heart of the metropolis. The Caledonian Hotel at Oban, which has lately undergone considerable enlargement, contains a hundred bedrooms, the equipments in which are all of first-rate quality; the saloon has dining accommodation for upwards of sixty guests; so that the other day, when I formed one of thirty-eight at the table-d'hôte—dinner faultless—this large and elegant apartment seemed to be half empty, though, as the season advances, it will soon be filled with strangers from all parts of the world. The *Times* (of the preceding day), without which an Englishman does not well make out existence, was lying on one of the side-tables. This is but a type, however, of many Highland hotels; and, in point of fact, anything shabby will no longer do. Where Johnson and Boswell were fain to sleep on a couch of heather, and eat oat-cakes, you will find handsomely built inns, furnished with all the appliances of civilised life. At the Trosachs on Loch Katrine; at Tarbert, Inverness, and Inverarnan on Loch Lomond; at Arrochar on Loch Long; at Inverary on Loch Fyne; at Balahulish; and at Brodick in Arran, travellers will find capital hotels, where they may agreeably spend a few days, and drive about in a very luxurious sort of way. Tourists on the grand route by the Caledonian Canal—the greatest work of its kind in Britain, and which should by all means be included in a northern trip—have an opportunity, as already hinted, of ruralising pleasantly at Banavie. There are here two hotels, an old and new one, under the same management, which make up unitedly sixty-two beds; and an addition is now making to the new house, which, we understand, will raise the number to eighty beds. The new house—an aspiring mansion in the Italian style—was built a few years ago, at a cost of several thousand pounds, by Cameron of Lochell. And who is the enterprising lessee of this hotel-villa but our Napoleon of Highland steamers—David Hutcheson—who thus insures, through a sub-tenant, Mr John

Mackenzie, the best accommodation to his Hebridean passengers.

If any one be disposed to accept our advice on the subject of Scottish tours, we should repeat the counsel, not to hurry too quickly over the very interesting stretch of sea and land between Glasgow and Inverness. Don't push on as if between death and life. Do the thing deliberately and satisfactorily; stopping a day or two here and there; making little side-trips to see deep mountain gorges, strange geological formations, scenes of deep historic interest, and waterfalls which we can assure Londoners will be found somewhat more effective than that at Shanklin Chine. With Hutcheson's steamers, with boats and light Highland cars, which can be hired on every desirable occasion, and hotels with which even the most fastidious can find no reasonable fault, what can be more exhilarating—what, to many, more new in physical and social aspect—than a well-arranged excursion in the West Highlands and Hebrides.

W. C.

THE THEATRICAL WORLD.

THE theatrical world, considered more particularly as a branch of that literary and artistic 'Bohemia' which has recently attracted public attention, is in all probability a *terra incognita* to the majority of our readers. Next door to the theatre, however—'next door' to every temple of the drama we know—is invariably a public-house, where we can at any time see the world in question, a world embracing managers and actors, and their satellites and hangers-on in general, but more particularly made up of lessees, shareholders, renters, acting-managers, stage-managers, prompters, leading men, leading ladies, heavy ladies and heavy men, singing chambermaids, juvenile tragedians of both sexes, first old men, first and second light and low comedians, walking gentlemen, respectable utility gentlemen, character actors, eccentric men, copyists, scene-painters, clowns and pantomimists, leaders of the band, *répétiteurs*, fiddlers and other musicians, wardrobe-keepers, theatrical tailors, dressers, dancers, chorusers, ballet-masters, ballet-girls, master and working carpenters, gas engineers, property-masters, property-men, cleaners, stage footmen, supernumeraries, box book-keepers, money and check takers, and nondescripts of all kinds (including the watchful mammas of the afore-mentioned leading ladies and singing chambermaids), the more particular designation of whom can only be known by an inspection of the treasury books—the treasury being a place certain to receive a visit at least once a week from the whole corps of theatrical hangers-on, the dramatic playwright himself not excepted. In addition to these, we have a countless number of dangles after actresses, admirers of actors, adapters of plays, theatrical critics, garrulous old players, whose great point is the *début* of Mrs Siddons; stage-mad people, whose ambition is to talk theatrical slang and give imitations of Kean; a small poet or two, a few painters, and three or four budding authors, who have always a manuscript tragedy in their pocket. These varied elements, properly mixed together, like the brandy and water they consume, make up, as the old poet says, 'a mad world, my masters.' Next door to the theatre, then, at the actors' house of call, we might see representatives of this motley crew, and from their conversation gather an idea of their world. We say *might* do so, if we would; but, fortunately, we are not compelled either to endure the smoky atmosphere peculiar to the actors' house of call, or submit to suffocation from the fumes of the hot spirits and water which are there the fashion. Lend us your eyes, kind reader, and look upon this broad sheet with us, and we will put you on another

and a better plan for your explorations of this mimic kingdom and its painted inhabitants. Our advice to persons wishing to view the theatrical world is to study the *Era* newspaper.

The most correct idea of the theatrical world, and its appurtenances of men and things, is undoubtedly to be obtained from that world's own oracle and friend, the *Era*, which is, to those engaged in the theatrical profession, what *Bell's Life* is to the members of the sporting world. In the *Era* we find the week's theatrical affairs detailed at full length. No matter what branch of the profession we desire to scan, in that paper we find the necessary particulars—all that is known about theatres, opera-houses, singing-saloons, tea-gardens, circuses, and exhibitions in general is chronicled, from the announcement 'to proprietors of first-class concert-halls, gardens, &c.,' of the disengagement of that eminent nigger, Herr Guildenstern, 'the great original performer on ten tambourines at one time,' to the astounding intelligence that Mr Waverley Mortimer Blank, 'the renowned tragedian,' is again, and for the third time, re-engaged at the Theatre Royal, Slashington. We can see also, in the news-columns, that the walking gentleman, who was advertising his services in the number of a fortnight ago, has been engaged at the theatre of Bagot-on-Shipston, where, we are informed, he has made a favourable impression on the Bagotonians; but we regret to find that 'the heavy man,' whose wife is useful in the 'singing chambermaids' (their joint terms being very moderate), is still out of employment. Poor gentleman! perhaps he is too heavy for the present state of theatricals, which are indeed tending decidedly to a lighter style than has marked their progress of late years.

There is no want connected with the profession that cannot be supplied by the advertising columns. As an example of what is done, let us take the case of the aspirant to stage-honours. He will find from an advertisement that he can be 'practically instructed and completed for the theatrical profession,' by a gentleman who for twenty years has been 'manager, author, and actor of the Theatres Royal, Drury Lane and Covent Garden, Lyceum, Strand, Adelphi, Olympic, and Surrey Theatres.' Or if the aspirant be a lady, here is her chance: 'Miss Charming has returned to London for the season. She is prepared to resume dramatic instruction to ladies, and undertakes soon to render them competent to fill situations. Terms moderate. It is desired to form a company for the provinces, to commence about September, and those who evince aptness will be engaged.' Supposing the stage-struck hero to have undergone the necessary cramming as to the 'business' of the boards—that he has been taught how to kneel to a lady, how to cross from P.S. to O.P., and further, that the gentleman of twenty years' standing has given him hints on the expression of stage passions—that 'madness opens the eyes to a frightful wildness, rolls them hastily and wildly from object to object, distorts every feature, and appears all agitation; the voice sometimes loud, and sometimes plaintive, accompanied with tears;' or that 'affectation displays itself in a thousand different gestures, motions, airs, and looks, according to the character,' &c. Supposing the curriculum of practical instruction to have been achieved, the next business is to procure a wardrobe, and an—engagement. We presume, of course, that the tyro, ere reaching this stage of his career, has like all other novices, laid in a large share of burnt cork, so useful in the fabrication of stage-beards, eyebrows, &c., and also a few hares' feet for the due distribution of the rouge and pearl powder, so

kinds of stage-heroes. The wardrobe is easily managed, especially in London, and we presume it to be from the great metropolis our Novice is setting out. Let us suppose, also, that he has already applied to the theatrical agents, in order to have his name placed on the roll of actors wanting an engagement. If his instructor has not himself introduced his pupil to one, he finds the address of several in the *Era*. Having 'stumped up' what the agent will facetiously designate 'the needful'—about half-a-guinea, more or less—his name will then be entered on the books, and an engagement ought to follow in due time. The agent of course inquires carefully as to his 'props'—that is, his properties, in the shape of dresses, swords, &c.; and finding that the youth is unprovided in those indispensable articles of dress which all actors are expected to find for their own use—as boots, collars, tights, shape-hats, swords, &c.—the agent pretends to glance at the *Era*, and then starting up from his chair, he hauls off the youngster, exclaiming rapidly: 'It's all right, my boy; come along with me to Sam Days; he's advertising again, and I'll get him to do it at a moderate figure for you;' and so the business of costume gets settled; and of course, as the agent is Days's friend, it is but right for him to pocket a trifle of 10 per cent. or so on the transaction.

At this stage of the affair, we may almost hail our youth as a member of the theatrical world; he has now the *entrée* at the agent's chambers—agents' chambers are usually to be found in a public-house—and that gentleman very condescendingly partakes of the Novice's beer, and tells him stale anecdotes of the players in return. In due time, the promised engagement comes on the *tapis*; some Saturday morning, just as the Novice is getting restive, the *Era* announces that 'Mr De Courcy Smythe intends visiting London, for the purpose of making arrangements for his ensuing seasons at the Theatre Royal, Slopperton, and the Royal Lyceum Theatre, Swindleham; and will be prepared to treat with acknowledged stars and professional talent, for the regular company, on and after the 20th instant: all applications to contain a stamped envelope for reply, and to be addressed to L. Suckem, at the Sword and Tights, Wych Street, Drury Lane.' The moment Novice reads this, he is off to Suckem's, at full speed, and insists upon that gentleman procuring him an immediate engagement in Smythe's company. As Suckem does not see his way to any more plunder, in the shape of beer or additional goes of brandy and water, he reluctantly complies; and in the course of a few days, Novice finds himself in the green-room of the Theatre Royal, Slopperton, an undoubted member of the 'profession,' and certain to have his goings and comings duly chronicled in the *Era*, for the edification of the public in general, and the theatrical world in particular.

There now opens to the greedy eye of Mr Novice that inner theatrical arcanum, veiled from the common gaze by the impenetrable green curtain; and for the first time he sees the mass of people connected with the theatre, of which he is but a unit, all in motion like the heavenly bodies circling round a common centre—that centre being Algernon De Courcy Smythe, the sun of the theatrical world of Slopperton. We will not attempt to describe 'Smythe's lot,' as Suckem calls them. They are sufficiently seedy in their apparel, and starved-looking in their appearance, to indicate at once their profession. Our aspirant soon finds out how much of tinsel and paint is lavished upon all things behind the scenes; he also finds how unreal the talk is of the mimes; how much each is for himself, and how little he cares for his neighbour, except when he

respectfully, while the heavy woman retails her titbits of scandal about the singing chambermaid; or, by winks and nods, insinuates that the low comedian's wife was seen, upon a late occasion, in suspicious proximity to a pawnbroker's office; how beautifully, too, she throws out a little innuendo about the leading lady's penchant for brandy and water; and, finally, after settling these small matters, observes with what an air she manages to borrow five shillings from the edified Novice. Out of doors—in the tavern frequented by the company—our young actor, not having much study to get through, mixes in the outer theatrical world, and has already even a hanger-on or two wholly to himself, simply because he belongs to a place that has such an undefined charm about it as to command a larger amount of attention than almost any other world, whether of science or art. There is centered in the theatre so much that is novel or wonderful, that even the utility actors of a fourth-rate town command their little circle of followers. In high life, does not the *Court Circular* chronicle the exits and entrances of the great heroes and heroines of the lyric drama? Does not my Lord Fitzkernal get the programme of the opera season sent down to him by special train the moment it can be had—damp as it is—from the printing-office? Of course he does; and there are a score of other noblemen who are equally ardent; and if our aristocracy do this, is it any wonder that Tom, Dick, or Harry, follow suit, and like to know all they can about what is doing behind the scenes of the Theatre Royal, Slooperton?

But time flies, and the Theatre Royal, Slooperton, after languishing for a few weeks, and entertaining but scanty audiences, abruptly closes its doors; the manager, as the low comedian says—accompanying the information with a wink of the eye and a twist of the tongue—is 'nowhere'; and the company, left without salary and with no prospect of immediate engagement, make the best of their way to the nearest harbour of refuge. But our Novice needs not be discouraged yet; he will frequently have to encounter such mishaps; they are a part of the system. But how is it, we are asked, that the Theatre Royal, Slooperton, is obliged to shut its doors? Slooperton is a large manufacturing town with an intelligent population, fond of theatrical entertainments; and, in former times, when its population was much smaller than it is now, it gave to London some of its greatest actors. It was one of the nurseries for the London stage. Kemble, Kean, Mundell, Dowton, O'Neil, Liston, Mathews, Bannister, Incedon, and a dozen others equally celebrated, trod the Slooperton stage on their way to London. We cannot tell, but so it is: the class who now attempt the reanimation of our provincial theatres are, with some few exceptions, mere parodists on the players of the past.

We may now, leaving our friend to find out a new field for the exercise of his histrionic talents, just glance at the country theatre. It is generally a dim dirty house, with a repellent poverty-stricken air, and situated in some hidden corner of the town, which only the most determined perseverance will enable one to find out. You pay your half-crown, and enter. At once you are unfavourably struck with the dismal appearance of the place. The old tattered seats, damp and mouldy, the old torn green curtain, that never will come down straight, the old scenery bare and worn out, the old battered drinking flagons and other 'properties,' that have been shewn at innumerable banquets presided over by innumerable Macbeths, are all characteristic of the place. Year after year are represented the same old stock-plays—*George Barnwell*, or, it may be, *Castle Spectre*, with the everlasting farce of *Fortune's Frolic*, or the *Ploughman turned Lord*. There is no thought of attracting the refined and elegant, nor even of inter-

esting the intelligent mechanic; no idea is entertained of keeping pace with the advancing spirit of the age. In fact, the provincial theatre fell fast asleep fully forty years ago, and has not yet awakened. But if the country theatre is bad, the country manager is a great deal worse. In nine cases out of ten, he is a mere adventurer, with little or no education, boresome and vulgar, with bullying manners, and a tendency to oblivion in all pecuniary transactions. We don't allude to the managers of first or second class provincial theatres, who are most of them respectable men. The specimen we select takes a country theatre as 'a spec,' goes to some dramatic agent, such as Sockem, and so collects a company. He hires a wardrobe from some Jew costumer, and by hook or crook gets himself and his company forwarded to the scene of operation. For the first week all goes well, the company obtaining the whole amount of their salaries. 'Business,' as it is called, continues brisk, perhaps even for a fortnight, and then a dismal change comes over the spirit of the scene. Some fine evening, it gets whispered about that the manager is 'nowhere'; and early next morning, the leading lady, who is inclined to be stout, has the misfortune to be caught stuck fast in the rather narrow window of her apartment on the ground-floor—a predicament she has got into through a vain attempt to escape the just demands of her landlady. Her 'properties'—consisting of five silk stockings, a pair of black velvet shoes, one and a half pair of white satin slippers, a much-used suit of silk fustings, one sandal, four skirts, an old red silk train and a tinsel crown, with a box of worn gloves and a white muslin robe—have been previously spirited away by the leading lady's mamma, who travels with her. The low comedian of the company, who travels only with a pair of tights and a few wigs, has been more lucky; he never takes his 'props,' as he calls the articles in question, to his lodgings, but always leaves them next door to the theatre in case of accident. After the escapade of the leading lady, a miserable attempt is made by the company, as a republic, to keep the place open for a night or two; but the mysterious disappearance of the wardrobe creates a difficulty which no amount of ingenuity can overcome; in addition to that, the printer (a green hand, newly arrived in the place) is wondering who he is to look to for payment of his bill; while to crown all, the landlord has taken possession of the key of the theatre, glad to get quit of the vagabonds without any rent, and the place is peremptorily closed. So ends a season which is the exact counterpart of many more, and thus runs the theatrical world its exciting round.

We can assure our readers that the picture we have painted of the unscrupulous manager who takes a theatre as a 'spec,' and the dire consequences which follow, is not over-coloured. As a companion portrait, we present that of an honest manager struggling with adversity—it is painted by himself, and no touch from our pen could make it more graphic. As will be seen, it takes the shape of an address to his audience at the end of a disastrous season:

After the usual thanks to the 'ladies and gentlemen' for their presence, he proceeds: 'At the conclusion, however, of a season which is well known to be about the worst there has ever been in this town, you will not expect anything very cheerful of me, especially when I tell you that I am very ill, that my wife is worse, and that we are both weighed down with turmoil, anxiety, and disappointment. I commenced my unfortunate season with an opera company for a fortnight, which was very unsuccessful. I then commenced with the dramatic company, which was still worse. . . . Finding everything going the wrong way, I strenuously endeavoured to procure the visits of some first-class

"stars." One, however, was in America, another settled for the time in London, and a third did not think this town would pay him—and those who did come, soon found such was the truth. With such stars as I could get, our receipts never exceeded £5, 1s., and were as low as £2, 17s. My friends, however, assured me that if I could weather the storm till Christmas, and then get up a pantomime, I might be sure of a reward at last. I tried the experiment; produced one—with much difficulty—that I believe gave general satisfaction; but, alas! although there were one or two fair houses, the receipts fell during the first week of its run to L.4, 13s., and during the second to L.3, 1s. 6d. I unfortunately entered into a contract to pay the enormous rental of L.225 for the season, of which—notwithstanding the bad business and general depressions—L.175 has been paid. (Cheers.) Finding it impossible to pay the last instalment, I made an appeal to the proprietors, and assured them that the L.60 I paid down was sunk, that what money I brought with me was gone, what I had raised was spent, and what I had borrowed was unpaid—that having lost my all, my wife being so situated as to be compelled to give up her professional duties—with an anticipated increase to my family—my season at an end here, and nothing settled for the future elsewhere, I must throw myself upon their consideration, and—a good rental having been already realised—hope for a release. To all this I received no answer, but a brief inquiry about what *security* I could give for the balance. I replied that I had exhausted every resource, and could pay no more; but that I was anxious to do all an honest man could do—that there was a great holiday coming on the occasion of the Princess Royal's marriage, and I would get up a strong entertainment, and they might put their own men at the doors and take the receipts. (Cheers and cries of "Bravo.") Now, ladies and gentlemen, I know that not one man in twenty would have made such an offer, and I ask you if mortal man could do more? ("No, no.") Well, to that proposition I could obtain no answer; but all at once, while I was expecting one, I found the bailiffs in the theatre. But I had acted according to a hint I had received, very carefully removing all my best things, and safely disposing of my wife's dresses, upon the value of which I had heard certain parties had been calculating; so when the bailiffs came in, they found little more than would pay for the distraint. (Tremendous cheering, and cries of "Bravo," and hisses from the proprietors.) It is to that fact, ladies and gentlemen, that I am enabled to appear before you this evening. I was therefore placed in a position to treat; but no thanks to the proprietors if I am not now obliged to leave the town without one article of wardrobe, consequently, unable to take any other theatre, or even an engagement in one—for the wardrobe is to an actor what tools are to mechanics—and as the result, in a short time, perhaps, to find my children wanting bread.

As is the country theatre, so, generally speaking, are country actors. The damp and mould of the one, with its ragged seats and tattered scenery, are but representatives of the muddled brain and seedy habiliments of the other. One cause of their decline is, that, in the present day, they can have no hope of 'a career.' The two great theatres of the metropolis are closed to the British drama: the one is a temple for foreign music and dancing; in the other, horsemanship, tumbling, antipodean feats, Tom Thumbs, and performing elephants, have taken the places of Munden, Downton, Kean, and Mathews; in other places the sublimity of the tragic scene has been usurped by the red-hot bombast of melodrama; and the fine old comedy of other days has been banished

to make room for the 'screaming' farce and the extravaganza. If we are so fortunate as to have even one great man to play a hero, he is surrounded by a mob of nobodies—ill-trained, and worse dressed, having no fitness for their profession whatever, except their consummate impudence. A shadow, in fact, has fallen upon the stage; and at present we have few players worthy of the name. The great ones of former days, and the best of their offshoots, are dead, and their memories are all that is left to us, for nobody has caught their mantles.

London, however, is still regarded as the common centre of the profession. Country managers—of whom there is about one hundred, not including the directors of the few strolling companies still extant—always resort to the great metropolis to gather together their little band, and pay their annual round of visits to such of the theatres of London as have an open door, and play in the national tongue; at the present time, there are about twenty of these, of various kinds and ranks. The country manager, and also the respectable country actor, have both of them a great liking for London. There they can enjoy a peep of that greater theatrical world of which their little town is but the miniature. The respectable provincial manager has usually the *entrée* to the best of the London houses, because most of the London managers being actors, he receives an annual visit from them, in their capacity of 'stars,' and so keeps up a friendly acquaintance. He thus gets wonderful peeps into the inner circle of some of our London houses, and obtains ideas as to how all the different 'oracles' are worked which help to oil the machinery of a London theatre. He sees the great man in his 'sanctum,' finds out the true relation between the London dramatic author and the critic of the daily paper, and sometimes stares to find them one and indivisible. Most of our play and farce writers are 'on the press;' and a shrewd manager takes care to select his authors accordingly, knowing that they form a clique, of which each member is bound to puff the other's production, because all in their turn need a similar favour. Still, however, the production of the new farce requires tact and 'management;' and there are numerous interviews between the author (translator, ought we not rather to say?) and manager, before matters get finally arranged, and the puff preliminary is sent out. Outsiders rarely get a piece accepted; but when they do, what a gantlet of criticism they have to run!

The country manager of the old school—Mr Placide, we will call him—not being engaged to dine either with Mr Buskin or Mr Roscius, his two most profitable stars, both of whom are managers of London theatres, steps down to Wych Street to the Sword and Tights, to enjoy a quiet pipe before the parlour fills with its wonted company. The organ of the profession, which he finds lying on the table, opens up a new world to him: he recollects the time, not many years ago, when the drama had no such expositor; and he is more than astonished, as he glances over the advertising columns, at the wonders with which it is filled, never having known before that there were so many kinds of public amusements competing for patronage. What particularly strikes Mr Placide is the manner in which the actors and actresses of the present day advertise and puff themselves, and how men, who are but fourth-rate actors in a second-rate London theatre, pretend that they are stars of the first magnitude in the provinces. Then in every second advertisement he comes on the word 'professional,' and determines to hate it, because it is a new word to him. He likes better the old word comedian or actor: 'professional' includes, he thinks, all sorts of horrors, such as niggers, bounding brothers, anti-podeanists, and equestrian troupes.

'Ay, ay,' says Placide to himself over his pipe, 'no wonder we managers can't make our salt now, with such entertainments surrounding us on all sides. Here is no end of concerts and exhibitions, where the public not only get amusement, but beer as well. What theatre, I should like to know, can stand against beer? Or, if we can beat the beer, by means of either Buskin or Roscius, can we stand up against the performing monkeys who are starring all the year round at the theatre; or, suppose we can even do that, how about the niggers in the concert-halls? A new Shakespeare could have no chance against the niggers—that he couldn't. Then, again, here in London we have the squalling Italians: there's Tamberlik going to get a cool thousand a month; there's a palace been run up for them in five months' time. Who would run up a palace in five months for the British drama, I should like to know?' And Mr Placide having vented these opinions quietly to himself, replenishes his tumbler, and re-adjusts his pipe, and has what he calls 'another go in at the paper.' But we need not follow him further. Suffice it to say, that he cannot tolerate the modern system of advertising at all. 'Only to think,' says he, 'that men have such impudence—men I would not give fifteen shillings a week to! Advertising; ay, it may be all very well for Mr Smythe—I can't afford it. Here is the thing for me;' and Mr Placide runs over the advertisement of the 'Inauguration of the Burial Ground of the Dramatic, Equestrian, and Musical Sick-fund Association.' 'Ay, the grave will have us all at last; I'm glad to see that there is sense enough left in our actors to provide for this last scene of all. Truly doth Shakespeare say:

Life's but a walking shadow—a poor player,
That struts and frets his hour upon the stage,
And then is heard no more; it is a tale
Told by an idiot, full of sound and fury,
Signifying nothing.'

And with these axioms of the great bard, we humbly take our leave of both the country manager and the THEATRICAL WORLD.

THE STORY OF A GREAT DISCOVERY.

It is always difficult to shake off ancient prejudices. Without a struggle, the truth of no new theory has ever yet prevailed against the errors of long-received opinion; for the latter is strong at once in all the strength of its own prescription, and in all the weakness incident to the novelty of its assailant. Of this truth one striking instance familiar to our readers occurs in the history of the Struggles of Vaccination.* Another instance, more striking still, presents itself in the story of that Great Discovery from which the birth of modern physiology must be dated.

The history of the discovery of the circulation of the blood, which M. Flourens has a well-established claim to have told for the first time with scientific accuracy,† extends, from Galen to Harvey, over a period of more than fourteen centuries. It may be difficult, but it will not, I think, be impossible so to strip it of its technicalities as to make the story not only intelligible, but interesting to the least scientific reader.

The arteries which, during life, as we now know, are distended with blood, are found, after death, to be not only in a great measure emptied of that fluid, but to contain air in considerable volumes. Reasoning from these facts, the physiologists who

preceded Galen, and especially Erasistratus and his school, maintained the theory that, like the windpipe, the arteries were simply air-passages, the air which penetrated to the lungs by the trachea being conveyed by the venous (or, as we should call it, the pulmonary) artery to the left cavity, or ventricle of the heart, and thence by the aorta, or great arterial trunk, and its innumerable ramifications, to every part of the system. From the functions thus hypothetically ascribed to them, the arteries derived the name they still retain (from Greek, *aer*, the air, and *terein*, to preserve, as a pipe preserves the breath).

With this theory, Galen was so little satisfied, that, while yet a young man, he set himself first to investigate, and then to overthrow it. He proved, by a series of experiments on the living body, that the arteries during life contained blood, but did not contain air: he shewed that the air which entered the lungs by inspiration did not penetrate beyond their air-cells; and he even ascertained that in some essential property the arterial differed from the venous blood. But here this great physiologist stopped. He had made, indeed, a great stride in advance of Erasistratus; but he had not, from his necessarily limited knowledge of anatomy, the means of determining the real nature of the respiratory functions. He believed that the office of the air was simply to cool and refresh the blood; nor was it fairly ascertained until some years after the death of Haller, whose opinion coincided with Galen's, that the lungs, and not the heart, are, in truth, the centre of animal heat.

The service, then, which Galen rendered to physiology, was to establish beyond a doubt that air did not pass *en masse* into every part of the body—that it did not distend the arteries, nor cause the pulse to beat. His discovery that arterial differed from venous blood in some essential property, he accounted for by a theory which subsisted—so enduring was his authority—until the middle of the sixteenth century. The veins as well as the arteries—so ran the new hypothesis—were necessary to supply the system with blood. But the blood of the latter had its origin in the left ventricle of the heart, and therefore, as the more spirituous, nourished only the more refined and delicate organs, such as the lungs. The blood of the former, which issued from the right ventricle, nourished the more gross and solid organs, such as the liver. But the venous blood, without an infusion of the spirit of the arterial, would not always be able to perform its functions. The wall, or *septum*, therefore, which separates the two ventricles, must be perforated as to permit the inferior fluid to be easily and uniformly supplied with a portion of the ethereal properties of the superior. I have already said that it was not until the middle of the sixteenth century that this error was corrected and exposed by Vesalius, 'the father of modern anatomy.'

But here, in his turn, Vesalius stopped. The discovery of the pulmonary circulation was reserved for a man who had devoted his energies not to anatomy but to controversial theology, and whose name has, by a terrible and melancholy event, been inseparably associated with that of John Calvin—Michael Servetus.

Here, however, it may be necessary to remind the reader, that in all the higher classes of animals there is a double circulation, the one wholly distinct from the other. The first is that which, under the name of the *pulmonary* circulation, transmits the blood through the lungs for the purpose of its being exposed to the influence of the air in respiration. The second is that which, under the name of the *systemic* circulation, distributes it, after having been so exposed, throughout the body.

Servetus, like Vesalius, denied *in limine* the truth of Galen's hypothesis, that a spirituous influence of

* See *Journal*, vol. vi., p. 16, and vol. viii., p. 263.

† *Histoire de la Découverte de la Circulation du Sang*. Par P. Flourens, Membre de l'Académie Française, et Secrétaire Perpétuel de l'Académie des Sciences (Institut de France), Professeur au Musée d'Histoire Naturelle de Paris, &c. Deuxième Edition. Paris. 1837.

some kind is transmitted from the left to the right ventricle through perforations in the septum. But he so far agreed with him as to admit, first, that there was an essential difference between the venous and arterial blood, and, secondly, that by reason of the *spirit* it contained, the latter was fitted to perform a functional part in the finer processes of the system for which the former was utterly unfit. But here again the two hypotheses clashed. The air we inspire, Servetus argued, has nothing at all to do with the refrigeration of the blood—nay, it is the very *spirit* which Galen pointed to as distinguishing the arterial from the venous fluid; for the venous artery* conveys the blood from the right cavity of the heart to the lungs; there the artery divides itself into a multitude of smaller vessels, which again unite to form the pulmonary vein; and by the pulmonary vein the blood is transmitted to the left cavity of the heart. 'It is during its passage from the one system of vessels to the other that the blood comes in contact with the air, assumes a scarlet colour, and is purged of its impurities, which are expelled by expiration.'

It was reserved for modern chemistry to demonstrate the nature of the chemical change which the air undergoes from its contact with the blood in the lungs. It was reserved for Harvey to discover that the blood is transmitted through the artery and pulmonary veins, not in small quantities, but in torrents. Otherwise, Servetus's exposition of the pulmonary circulation, when divested of its metaphysical entanglements, is clear and satisfactory. The difference of the two circulating fluids was pointed out. The unity of the circulating current yet remained to be demonstrated.

Servetus fell a victim to Calvin's intolerance. His treatise *Of the Restoration of Christianity*, which contained his discovery, and of which only a few charred fragments remain in the Imperial Library of France, was burned with him, and the discovery itself was for a time lost. At length, about six years after his untimely end, Realduo Columbus, a professor of Padua, then the most celebrated school of anatomy in Europe, arrived by an independent process at the same results, and began to teach the doctrine of pulmonary circulation exactly as Servetus had laid it down. He was followed at Pisa by the celebrated botanist, Cesalpinus, who was the first to introduce into anatomical nomenclature the now familiar phrase of the 'circulation of the blood.'

Amongst the most distinguished of Vasellus's pupils was that Fabricius d'Aquapendente, who during fifty years filled the chair of anatomy at Padua, and contributed more perhaps than any other person to the scientific reputation of the school. In 1574, he discovered the valves of the veins and the mechanism which permitted circulation, and thus made another important step towards a knowledge of its true theory. 'But he did more than this; for Harvey was his pupil; and it was under his instructions that the mind of the young Englishman became stored with that knowledge, and was trained in those habits of reflection, which enabled him, some years afterwards, to arrive at results so important not only to science, but to the welfare of mankind.'

Fabricius survived his great discovery five-and-forty years; and it may well seem strange that he should have gone down to the grave without having seen its full significance. This was seen by Harvey, and by Harvey alone, of all the anatomists of that age; and in 1618,† the very year of Fabricius's death,

he first proclaimed the great truth to the world from his professorial chair.

'I remember,' says Robert Boyle, 'that when I asked our great Harvey, in the only discourse I had with him, which was but a little while before he died, what were the things which induced him to think of a circulation of the blood, he answered me, that when he took notice that the valves in the veins of so many parts of the body were so placed that they gave free passage to the blood towards the heart, but opposed the passage of the venal blood the contrary way, he was invited to think that so provident a cause as nature had not placed so many valves without design; and no design seemed more probable than that, since the blood could not well, because of the interposing valves, be sent by the veins to the limbs, it should be sent through the arteries, and return through the veins, whose valves did not oppose its course that way.'

In 1628, Harvey published his famous *Discourse on the Motion of the Heart and Blood*, which forms the basis of modern physiology. From a passage in this great work, it would clearly appear that its author fully anticipated the rancorous opposition which the startling novelty of his discovery excited. It was assailed at once by men of science, and by men of letters. By the former, the great anatomist was stigmatised as an impostor; by the latter, as a daw in borrowed plumes. By the vulgar at home he was held, says Aubrey, to be crack-brained; and, as he tells us himself, of all his proselytes amongst the faculty, not one exceeded the age of forty. On the continent, his assailants were numerous, powerful, and uncompromising. The opposition of the Paduan anatomists may have been in some degree influenced by jealousy of their ancient pupil; that of the medical faculty at Paris arose exclusively from what M. Flourens calls 'their ridiculous infatuation' for Galen. Still, the doctrine was early taught in the Jardin du Roi by Durozer, and by Dionis, the first surgeon of that age. 'If M. Durozer,' says Guy Patin, in one of his amusing letters, 'knew nothing more than how to lie and the circulation of the blood, his knowledge would be limited to two things, of which I hate the one and despise the other. Let him come to me, and I will teach him a better way to a good medical practice than this pretended circulation'—to Patin, whose practice was limited to bleeding and the administering of senna! 'We save more patients with a good lancet and senna, than were ever saved by the Arabian physicians with all their sirups and opiates.'

In France, however, as M. Flourens remarks, 'this folly was confined to the faculty; it did not belong to the nation. Molière ridiculed Guy Patin,* and Boileau ridiculed the faculty, and Descartes, the greatest genius of the age, proclaimed his belief in the circulation.'

Dr William Hunter has said that, after the discovery of the valves of the veins, the remaining step towards the discovery of the circulation might easily have been made by any person of common sense. It is remarkable that the simplicity of great discoveries should always be made to derogate from the genius of those who make them. Now, Aquapendente was surely a person not devoid of common sense, and yet even he failed, as we have seen, to perceive the true bearings of his own discovery. 'He said, indeed,' as Mr Lewes has remarked, 'that the purpose of the valves was to prevent the accumulation of blood in the lower parts of the body!' Nor would it be a hard task to prove, in spite of De Blainville's insinuations to the contrary,† that, even as a possible process, the true theory

* The *vena arteriosa*, or pulmonary artery, it may be as well to remind the reader, is so called because, although it has the structure of an artery, it contains venous blood.

† Dr Willis, in his *Life of Harvey*, published by the Sydenham Society, antedates this event three years, without assigning any reason for so doing.

* Guy Patin is the *Diafoirus of L'Ecole des Médecins*.
† *Histoire des Sciences de l'Organisation*, vol. ii. p. 227.

of the circulation was suspected by no European anatomist during the time which elapsed between 1574 and 1618, except by Harvey—who, as even Hunter admits, was at work for many years 'upon the use of the heart and the vascular system in animals.' Any attempt, therefore, to rob our countryman of the glory of his great discovery 'must be silenced by a decisive verdict.'

'Perhaps,' said Sir Humphry Davy, in reply to some one who was remarking on the value of his discoveries in the decomposition of the earths and alkalis—'perhaps you give me more credit than I am entitled to. Others discovered the voltaic battery; the time had arrived when it was to be applied to the purposes of chemistry; and it was into my hands that it first fell.' Something like this, perhaps, may be said of the discovery whose history we have been considering. A little earlier, and it could not have been made; a little later, and it would have been made by some one else. With the old dogma of a perforated septum unexploded, the discovery of the venous valves would have attracted no attention; and before the discovery of the venous valves, the idea of a double circulation would have been laughed at. Step by step in this wonderful story we mount, from Erasistratus to Galen, from Galen to Vesalius, from Vesalius to Servetus and Columbus, from them to Aquapendente, and from Aquapendente to Harvey, who, gifted with a more comprehensive genius than any of his contemporaries, took advantage of the labours of his predecessors, traced analogies which had been overlooked, laid bare the fundamental organism of the higher animal economy, and demonstrated the laws by which it is regulated.

DOWN AT THE GRANGE.

III.

It was on a Tuesday, in the midsummer, and the squire was gone to a meeting, likely to be a stormy one, upon education, at the neighbouring town; Miss Markham, ever desirous of a little shopping, had accompanied him, and I had intended to have done so likewise, had not the illness of a parishioner suddenly prevented it. His case requiring certain aliments which were not within the scope of our resources at the vicarage, I walked down to the Grange, according to custom, to request that they might be sent to the sick man's cottage. Mrs Markham was not within; but the beauty of the afternoon enticed me upon the terrace, the extremity of which communicated with the walled garden. The gate was always kept locked, I knew, and only the squire and the head-gardener had the keys of it. Sauntering slowly along upon the turf, and drinking in the prospect dreamily, I had reached the extremity of the walk, and was about to turn, when I heard the whispering of voices. I could not see who the persons were, for they were behind the wall in the garden close below me; they had no business there, I knew, and had probably come after some very choice melons of the squire's. I made no scruple, therefore, of listening; but after the first few words, I felt as though I would have given both my ears rather than have done so.

'I tell you, Jane, that now or never is the time. There is a heap of money in his desk to-day which will go to the bank to-morrow. Markham is away at Ruffham, and it will not kill him when he comes to find it gone.'

'Never!' said a clear full voice which I knew to be Mrs Markham's. 'I will die first. I will go away with you yourself, before I would rob my husband.'

'Your husband?' said the other with a sneer. 'Pooh, pooh! you need not be so squeamish for a few pounds, since you are in for so many pennies already. Why, you've made free of hundreds'—

'Not a shilling,' she interrupted vehemently—'not one single shilling have you touched of his. My own luxuries, my comforts, the wants of God's own poor, have gone to support your profligacy; but not one farthing of his, Heaven knows.'

'Jane,' said the ruffian slowly, 'take you good heed to what I say: I'll blow upon you, and tell all to his face. I'll carry you off, I swear it, before his very eyes. What you have known of me hitherto is nothing to what you shall know of me when you and I come to live together again.' I seemed to see and feel through the wall itself the shudder that ran through that poor lady's frame at these words. If I had thought the worst of her, instead of being assured, as I then was, that her wicked husband Heathcote was indeed alive, and persecuting her with a power more terrible than ever, my heart would not have bled for her less painfully, my indignation against him would not have risen higher; but as it was, my teeth were grinding in my wrath, and my stick was furiously gripped, as though it were a sword. Silently, like a thief in the night, I stole down to the wall, and setting my feet in some convenient crevices, peered cautiously above it. Both, luckily, had their faces turned away from me; but I could see, even on the man's back, scoundrel and coward written. His poor wife's wrongs and goodness, and all that I had heard of his brutality, swept over me in a sea of indignation. Oh, for one quarter of an hour of my college-days, before I had put on that ecclesiastical garb! Oh, to have given him ever so brief an example of that 'one, two,' which I remember to have had some skill in, in the bygone time. My years and profession, indeed, were already so far forgotten, that I rather wished he might just have laid his hand upon her in his rage. My stick was an ashen one, and would not have broken for some time, I think. He wanted to do it, I could see by his twitching fingers: the bowed and trembling, but still graceful figure; the appealing sob, of which I could only guess the meaning; the young life withered and struck down in its joy by his cruel threats and presence—they moved him not one jot. I dared not trust myself to look any longer, but resumed my station at the foot of the wall. After a storm of menaces, met by almost hysteric expostulations that grew feebler every moment, I heard him say: 'You know where I am to be found, woman; and if what I demand does not come to my hand within the next eight-and-forty hours, I come to this house as surely as you are my wife, and claim you.' I heard a fall upon the ground, and knew that his poor victim had fainted; but I waited until the wretch—who heeded her no more than if she were a log—had left the garden and plunged swiftly into the copse that fringed its northern side. I ran in then at the open door, lifted Mrs Markham from the path, and revived her at the spring that flowed hard by. She was afraid, on coming to herself, to look up at me, taking me for Heathcote; but I told her how I had walked in, seeing the gate open, and expecting to find her gardening, and how I feared the heat had been too much for her. She was ice-cold, poor thing; but she murmured: 'Yes, the heat, it was the heat,' as I supported her homewards up the hill. I got away immediately, and pretending a telegraphic message, packed up a little carpet-bag, drove down to the railway station at full speed, and arrived in time for the up express, as I had hoped:

IV.

On the next Wednesday at noon I was back again, and at once took my way down to the Grange. Mrs Markham had been very ill, I heard, and was now no better; the squire was even then at her bedside. I sent for him upon the plea of very urgent business, and he came down into the library at once. *His hand*

not been in his own house, and expecting to meet no other but himself, I should not have known him. His eyes were swollen and dull, his gait tottering, and his features white and drawn like the face of a dead man. She had told him all at last; his first and only love, his true devoted wife, the partner of six happy, happiest years, was to be torn from him by another, and doomed to a life of misery.

'Grantley,' said he, in a hollow unnatural tone, 'I have that to tell which will wring your heart, I know—it has already broken mine.' He had fallen into a chair, like one whose limbs refused to sustain him, and the tears coursed down his cheeks unchecked and unceasing.

'Markham,' said I, 'I know all—everything—more, I think, than you can tell me. Your agony is not for yourself, but for your—for her, I am well assured. She shall not be dragged away. Be comforted. He shall never touch a hair of her head.'

His despairing eyes turned towards me not without a touch of hope. I was about to speak further, when the front-door bell rang gently.

'The man is come,' groaned the poor squire, as if inexorable fate had laid its very hand upon his shoulder.

'Shew him in,' said I to the servant, for his master seemed to have lost all power of speech. For my part, I drew a hopeful augury from that delicate bell-ringing: a ruffian that had nothing to fear would have pulled with both his hands.

Heathcote slouched in with an insolent air, half sneak, half bully.

'I don't want the parson to hear what I have got to say to you,' were his first words.

Mr Markham, who kept his back turned towards him, waved his hand to me in sign that I should speak for him.

'You may say whatever you will,' said I quietly. 'I am aware of the object of your coming: you want to extort the money from this gentleman, which you tried to persuade another to steal from his own desk.'

'Oh, she told, did she?' said the villain, with a diabolical smile. 'It will be the worse for her, presently, that's all.'

'No, sir, she did not, if you mean your wife, Mrs Heathcote. Ay, sir,' added I, as he started back, 'we are aware of all that and very much more. You were overheard in the garden. There is more than one thing known, *witnessed*, Henry Heathcote, of your old doings, which you are not aware of.'

I saw him turn as pale as the poor squire himself. 'Whether or no,' said he after a little, 'I shall have the money or I shall have my wife—who has committed bigamy—whichever that gentleman there pleases.'

'That gentleman,' said I, as I observed Mr Markham was about to speak, 'is not to be intimidated month after month, as Mrs Heathcote was, into supplying your bottomless purse. Nay, sir, your oath is not to be trusted; I hold in my hand a warrant for your apprehension, procured yesterday from Hampshire by Mr Raby, upon a charge of forgery, the proof of which I have now with me. The consequences are upon your own head, remember, and when you leave this house, it will be for a jail.'

'I was quite prepared for this, sir,' said the ruffian, with a look of indescribable malice. 'Mrs Markham that was, will, however, accompany me to prison. Fine food for the scandal of the county that will be; and a good convict's wife she will make to me in my banishment without doubt.'

Mr Markham writhed like one in torture upon his chair. We were indeed in the man's power, as he said, and my journey into Hampshire had been but of small service. One desperate course, however, which

I tried it. 'Miserable man,' said I sternly, 'do you then dare to force us to extremities; you scoff at banishment, but what say you to the gallows? you'—I strode up to the trembling wretch, and laying my hand upon his shoulder, whispered aloud—'you murderer!'

The sweat stood out upon his pallid brow, his knees smote together, and his hair seemed absolutely to bristle up, so abject was his terror. 'Mercy, mercy! I never found the notes,' he murmured. 'No,' said I; 'but here is the packet'—and I produced it—and red with the blood that still cries out against you! At the sight of this frightful evidence, the coward knelt upon the floor and covered his face with his hands.

'Rise, wretch—go!' thundered the squire, who had risen up like a man returned to life from the grave. 'Here is money, the sum that you demanded—take it. If ever again these eyes of mine light on you, as sure as there is a sun in heaven, I hang you.'

The cast-down, half-paralysed figure of Mr Markham seemed to dilate as he said these words; he looked like some incarnate Nemesis denouncing a certain vengeance upon the creature at his feet. It gathered itself up like a stricken hound, seized the proffered notes without daring to look up into the donor's face, and rushing out of the door and from the house, as though the executioner was even then upon his heels, sped away under the flaming eye of noon from Woodislee, for ever.

V.

Mr Raby's guess had been a true one. The pocket of Heathcote had been picked by one of his wicked companions in the bush, and he had murdered the thief for the purpose of recovering the packet, in which hope he had been foiled. This having been found upon the body, had been judged conclusive to identify it with his own remains; and for these so many years he had not dared to shew himself in civilised parts to gainsay it, but had lived the marauding life of a bushranger. Tired of this, and having by a successful pillage obtained enough money for his transit homewards, he had ventured back to England. Finding his unfortunate wife well married and in such great happiness, his hatred of her was redoubled, and his determination strengthened to persecute her further at all hazards. The poor lady had never before had strength of mind to reveal his extortions, nor the horrid truth of his being still in existence; and now her confession, and the certainty of having to leave her beloved Markham for this dreadful husband, had brought her into the most dangerous state. She had prayed for death more fervently than any dying man for life; when, therefore, the squire had carried up to her the result of my interview with Heathcote—for he did not needlessly distrust her with the account of his new atrocity, and of the means whereby he had finally got rid of him—she was almost beside herself with joy. Her gratitude towards me was without bounds, and as she strove to raise her attenuated form from her couch to receive and thank me, tears choked her utterance. The squire was but little more composed. With their mutual confidence, which had been but this once broken, quite restored, and their very life-blood, as it seemed, set once more flowing in their veins, it fell to me to wake them from their dream of new-found happiness, by reminding them of the real position in which they stood. The reaction from the extremity of despair to the certainty of safety, had been too great to admit of any thoughts save those of unalloyed content. Good and Christian man as the squire was, the circumstance of Mrs Markham being still the lawful wife of Heathcote

therefore making her continuance at the Grange impossible, had never once occurred to him. The man having been thoroughly got rid of, and all idea of personal annoyance at an end, Mr Markham had dissociated her in his mind from all relations with her first husband at once. The poor lady must have indeed thought often of her sad case, but had put it from her, probably, as something too horrible to be dealt with justly; nevertheless, she was the first to see the rightness of the path, which it was my duty as a clergyman to point out to both of them. If ever there was a case wherein spirit and letter seemed at war; if ever one wherein an innocent error seemed to be more terribly avenged than crime itself, I acknowledged that it was this of theirs. My heart was wrung for them to its core, but I had no glimmer of doubt as to what was necessary for them to do. Tenderly, but firmly, I put it before them; and before I had done, Mrs Markham sighed to me that it was enough. 'I go,' said she, 'dearest George, at once, while I have still strength to travel.'

'The vicarage, madam, is of course your home as long as you please.'

'I thank you, dear Mr Grantley, but I leave Woodislee,' said she, 'as far behind as possible this very night.'

'And I,' chimed in the good little old maid, whom we had almost forgotten, she had been so silent a spectator—'and I with you, sister Jane, to the end of the world, if you will. She is my care, George, from henceforth, for I have wronged her in my heart.'

The squire's grief was terrible to witness; but he made no opposition. Miss Markham had a small estate in a distant county, to which it was arranged that the two ladies should immediately remove. Boxes were hurriedly packed, the travelling-chariot ordered to the door; and after such a leave-taking as I trust does not often fall to the lot of mortals, the invalid was lifted in, in a fainting state, and borne away swiftly into the night. Darkly, indeed, it fell upon the Grange, where the widower was left mourning for the wife that was yet alive. Weeks and months passed by, but he would not be comforted. The sketch-book on the table, the piano in the hall, the flowers that her graceful hands had tended in and about the house, the garden wherein she had loved to busy herself, her favourite walks, the very prospect which her soul had so delighted in, were robbed of all their charms for him at once. Tears instead of smiles sprang forth at the sight of them, horror was born of them in place of joy—skeletons of their former selves wherefrom the glory had departed, and into which the life was no more breathed. As kind and as good as ever, his cheerfulness seemed quite to have forsaken him, and he was growing old at heart and gray on head apace. Mrs Heathcote—for she had reassumed her former name—never wrote one line to him, nor he to her; but his sister corresponded with the squire daily, and to receive those letters and to talk with me and others who had known her of his departed wife was his sole pleasure.

It was some two years after the separation of Mr and Mrs Markham, that I exchanged my vicarage at Woodislee for the summer months, on account of the sickness of my eldest child, for a parish on the seacoast, and with much difficulty, I got the squire to accompany us. The novelty of the mode of life and scene were somewhat benefiting him, and long excursions on the water affording him most amusement, I persuaded him to take them continually. One evening, while he was thus employed, I was suddenly sent for to the beach, to see what could be done for a poor fellow who had fallen off the cliff. He was, the messenger told me, as we hurried along, a well-known accomplice of the smugglers infesting that part of the

coast, and had met with this accident, it was supposed, while signalling to some of them the approach of a revenue cutter. A little crowd had gathered round him on the shore, but not evincing that sympathy which is usually felt among the poor in places of that sort for victims to the excise-laws; they had, however, furnished him with a mattress, and were giving him water. He was speechless, and scarcely sensible, they said; but a glance at his terrified eyes as I came up convinced me to the contrary. Mangled as he was about the head, and altered by what appeared to me to be the certain approach of death, I recognised the wretched Heathcote at once. He was borne, by my directions, to the nearest cottage, and a man on horseback despatched for medical help, although I saw it could be of little avail. I remained by his bedside all through that night, and it was a fearful one. When the doctor told him that, without doubt, he was a dying man, I thought it would have killed him on the instant. 'I have done everything that is horrible, and nothing good my whole life long,' he said. I gave him such comfort as I could with truth afford him, and urged him to penitence and prayer. His murder, his felony, and whatsoever other crimes he may have committed, did not seem to oppress him so heavily as his treatment of his poor wife. 'An angel, an angel,' he repeated constantly, 'and I was a fiend to her. Markham, Markham, he will make her happy yet. Poor Jane!' 'Poor Jane!' were his last words. When, after his burial, I told the squire this, he was affected to tears. 'My hatred of that man,' said he, 'has stood between me and heaven, I believe; but I forgive him all.'

In twelve months' time from that forgiveness, he stood within this church upon the hill at Woodislee, and was married afresh unto Jane Heathcote by me. It was a happier day than any of us had hoped to see at the Grange again; the only person who shed a single tear was dear little Miss Markham, but that is her way of expressing intense satisfaction. Not a villager was there who did not rejoice in their joy, from the ancient clerk of eighty years, who kissed the bride's hand at the door, to the little school-children who scattered flowers before her feet. There is very little else to tell. Besides, see, there comes toddling up to us a little fellow before whom nothing further must be said; a pleasant-looking, handsome lad with the smile—the old smile that is worn again now—of his mother. Once upon a time, I remember, she said that she was happy not to have him; but they were both glad at the Grange, too, I think, to welcome the young squire.

OCCASIONAL NOTES.

MEDICAL WOMEN.

In a recent number of our *Journal*, we took occasion to make further known the very interesting history of the education of Dr Elizabeth Blackwell of New York; the first woman, or certainly the first Englishwoman, who has become a regular diplomaed physician. Such trials and difficulties as that lady had to go through and overcome are now happily at an end for all others of her sex who contemplate making themselves useful to humanity as healers of disease.

A female medical college—of the sort which Dr Blackwell in 1849 trusted to see instituted 'in course of time'—has been established at Philadelphia for some seven years, and we hold in our hand the valedictory address to its students of Ann Preston, M.D., Professor of Physiology and Hygiene.

This seems to us to be a prudent as well as an eloquent composition. There is no indignant declamation about women's wrongs or alleged intellectual inferiority, and no ambitious exultation at the idea of

'medical men' being supplanted by medical women. The sphere of the new practitioners is declared to be mainly confined to the sufferers among their own sex, who 'are especially the victims of a wrong hygienic condition, and need medical advisers with whom they can commune freely,' and by whom they can be physiologically instructed. In the *Appeal of the Corporators* of the college, affixed to the valedictory address, this point is also judiciously urged:

'They consider that woman, as a wife and mother, pre-eminently needs a clear understanding of the functions of the human body and the means of preserving health; and that high-toned and intelligent female physicians, from their relations to their sex, must be most important instrumentalities in imparting such knowledge, where it is most needed and will do the most good.'

'It is well known that there is a vast amount of suffering among women, which is left without relief, from the shrinking delicacy of its victims, and it is therefore a demand of humanity that women should be put in possession of the requisite knowledge to administer the required treatment in such cases.'

Indeed, among the more liberal of the faculty here in England, we have often heard it admitted that women would be, for many reasons, far siter medical attendants upon their own sex than men; 'but,' add these ungallant sons of *Æsculapius*, 'though we believe they have nerve and intelligence in plenty, we fear their *crotchets*: we scarcely ever knew a woman of mind without some twist in it.'

Dr Ann Preston, however, affords an example of one who has either been born without the twist, or whose professional education has enabled her considerably to rectify it; she gives satisfactory evidence, too, upon another matter, concerning which the ladies have been much maligned.

'Notwithstanding the common reproach that women are ungenerous to women, and that they exhibit pettiness in transactions of business, I am glad to be able to tell you that in my intercourse with them I have found, with few exceptions, the reverse to be true: nobleness, generosity, and sympathy all unhopd for, have been largely manifested, and my professional experience has deepened my respect and regard for woman and for humanity.'

'Ladies, if you prove yourselves capable and worthy, as we believe you will, society is ready to receive you; on every side the demand for your services is becoming more imperative.'

'But you must not expect a lucrative practice to spring up in a day. Solid superstructures are the work of time; and slowly, carefully, woman also must work her way, building up the reputation which is her professional capital.'

The opposition which these female practitioners have had to encounter has, of course, been very considerable; and even now the professor warns her class of the unacknowledged, or but half-acknowledged, position which they must needs occupy. 'That sympathy and assistance from older members of the fraternity, which the inexperienced practitioner so much needs, will indeed be given you by many of the wise and good: even now, numbers of those who are recognised as standing among the highest in the profession will meet you freely in consultation; but still we cannot ignore the fact that, as a body, physicians have not yet welcomed woman into their ranks as a useful or desirable auxiliary.'

The whole cost for two or more courses of lectures and for graduation at this Philadelphia college is only 175 dollars. And for the encouragement of those whose means will not allow of the usual expenditure, six students will be admitted annually on the payment of twenty dollars per session, exclusive of the matriculation, demonstrator's, and graduation fees.

A department of remunerative and virtuous activity is indeed thus opened, with very moderate outlay, to females. And we cordially agree with Professor Ann Preston, M.D., that those women who shew themselves competent for the medical profession, deserve without doubt to succeed in it. 'Fitness and capability will indicate themselves against the world: they are God's endorsement of the rightfulness of any position.'

EXORCISM OF THE SMOKE FIEND.

An act is to come into force next month for the final putting-down of smoke in factories. It becomes of course a point of wisdom with factory proprietors to prepare for a change which it will no longer be possible to avert; for, though their reluctance to make the required alterations has heretofore baffled local acts and local authorities, we apprehend that this will no longer be possible with a general act, any more than it was with the proprietors of the Thames steamers four years ago—all of which are now smokeless, much to the comfort of the public. We have no doubt that the old proverb, 'where there is a will there is a way,' will receive fresh illustration on this occasion. The old objections as to impossibility of preventing smoke in engine-furnaces without diminishing power, can no longer hold, after what we have seen on the Thames, and what we see in many furnaces on land—our own, for example, where for nine years past there has been no smoke whatever, excepting for a few minutes each time the fire is put on after an interval of work, and this without any detriment to the efficiency of the machinery. Our plan, thus proved so effectual, and by which *ten per cent. of fuel is saved*, is Jeuker's patent (revolving bars for slow feeding); but there are many other effective plans, some of them perhaps even simpler,* and it is likewise ascertained that, with 'ample boiler-power, good draught, and a regulated and moderate admission of air into the furnace,' there can be no offensive amount of smoke. There will, therefore, be no valid excuse for breach of the law. Its violators must be held as making plain confession that they refuse to take a little trouble and incur a little expense to save the public from this intolerable nuisance; and they will stand the consequences.

We most earnestly hope that there will be no slackness on any hand in carrying out the behests of the act. The physical annoyance sought to be put down is 'gross, open, palpable,' leaving no excuse for neglect of remedial measures; but it requires only a little reflection to see that there are also moral and social consequences of smoke, and these of no light importance. In large towns much exposed to smoke—Manchester and Liverpool form marked examples—we everywhere see a tendency of the upper class of people to live in places by themselves out of town, the main purpose of the movement being to get pure air. That the smoke is the main grievance sought to be avoided, becomes evident when we view the case of a city like Edinburgh, not much polluted by smoke, where we find no similar tendency. There, the people really live in town. Now, when families are thus dispersed, and for any intercourse a large space has to be traversed, it becomes impossible to have an easy and inexpensive style of entertainment: hence an encouragement to ultra-luxurious habits—itsself a great evil. The worse evil, however, is, that the cultivated and intelligent classes are wholly separated after four or five o'clock every day from the mass of their fellow-citizens, who, thus deserted,

* The system of revolving bars necessitates the use of a kind of coal which does not form large *scories* (clinkers), as these make a choke at what is called 'the bridge.' Where the suitable coal cannot be got at a moderate price, it will of course become necessary to resort to some other plan.

seek amusements and indulge in tastes of their own, wholly free of the moral element which an upper class can impart. A separation of *sympathies* also becomes unavoidable, and thus it may be that revolutions are partly prepared for even by so apparently insignificant an agent as—*smoke*. If this fiend, then, can be effectually put down in our large industrial cities, we conceive that an improvement is effected, not merely in our daily physical experiences, but in our social and political estate.

DAS SECHSE LÄUTEN, OR THE SIX O'CLOCK BELL.

IN the present age, when practical usefulness and scientific inventions are driving poetry and imagination from the field, the old customs and festivals of former ages are rapidly disappearing. We are not amongst those who desire to mourn over the departure of 'the good old times.' If, with the sports and pastimes of former days, something of light-hearted mirth and fun has passed away from this worky-day world of ours, we believe it is only the shadow we have lost, and that the substance still remains; we believe that with fewer stated periods for festal enjoyment, man is a happier, nobler being than in the days of tourneys and morris-dancings, of May-poles and mummings. But we would not have the memory of these things die; they are interesting as signs of the times; and indications of national manners, customs, and feelings, deserve a place more important than is usually assigned them in the pages of history. These fêtes, which melt under the progress of civilisation like snow before the mid-day sun, still linger in some parts of Europe, and are cherished by the inhabitants of certain districts or towns with fond reverence. One of these national festivals which prevails still at Zurich, is curious and interesting enough to merit especial notice. It is called 'Das Sechse Läuten, or the Six o'clock Bell.' This custom has existed from time immemorial, and its origin remains a matter of dispute.

Those who refer its commencement to a historical event, tell of a time when Zurich, having expelled from its councils certain men obnoxious to the state, was threatened with an attack from these malcontents, who incited the neighbouring Counts of Hapsburg and Toggenburg to join them in their treacherous design. The plot was defeated by the penetration of the boatman employed to ferry them across the Limmat, who, detecting in their words and gestures something which savoured of treason to his beloved city, contrived to sink the boat, and bury the conspirators in the waters. Meantime, a boy who had been concealed behind a large stove, had overheard words which betrayed the treacherous plan, and conveyed intelligence of it to the burgomaster; the great bell of the church tolled an alarm, and quickly the inhabitants flew to arms: those conspirators who had escaped drowning were met by men prepared for their reception, and speedily put to the sword. A walled-up door was formerly shewn in the church, as a memento of the bloody night, through which some traitors attempted in vain to force a passage to stop the ringing of the bell. This account of the origin of the Sechse Läuten is accepted by many, who affirm that on the anniversary of that day of deliverance, a kind of carnival was held in the town.

Another version, and one more consistent, we believe, with probability, is, that it was a festival in honour of the approach of spring. When the sun begins to rise higher and higher in the heavens, and the winter is retiring before his warm and life-giving beams, then the people rejoice with great joy; and on the first Monday after the spring equinox, the fête is held. On this day, the bell of the principal church

begins to toll at six o'clock P.M., and continues its evening chiming until the autumnal equinox returns. Those alone who know what a winter amidst snowy mountains is, can comprehend the joy of the Swiss peasants when the days begin to lengthen, and the sun penetrates for a few more hours daily the deep recesses of the valleys. Nature, which has so long presented one monotonous and dreary aspect, puts forth new signs of life; green leaves appear, and tiny flowers peep above the snow; the meadows look fresh, and the birds begin their sweet spring songs; the snow yields its place to verdure; and the brooks, forced from their icy fetters, dance as if from joy. Then the human heart rejoices too; the intercourse between the mountain hamlets and the towns, so long suspended by snow-drifts, is resumed; and man once more meets his fellow-man in the market-place or in the church. Surely it is a season for joy and thanksgiving; and as a celebration of this return of life and gladness, we are inclined to regard the Sechse Läuten.

It is impossible to fix any date to the commencement of this festival; it seems to have been held annually, and reminds us strongly of the ancient German festivities with which the return of spring was hailed—remnants of which may still be found in the Steiermark, Silesia, and Bohemia, &c. Here, as there, the fir-tree—usually associated with Christmas in other parts of Germany—plays a conspicuous part; it is decorated with garlands and bright ribbons, and carried through the town by girls dressed in white.

The Zurich records furnish accounts of the various modes in which the Sechse Läuten has been celebrated. The ceremonies observed were in some points always the same, but additions and variations were made each year, which prevented monotony. The Zünfte or guilds of the different trades undertook the chief management. The freemen or livery of each guild assembled in their respective halls to share the mid-day and evening meals; the rooms were ornamented with boughs, garlands, and streamers; and as the six o'clock evening-bell tolled its first note of welcome to the spring, the halls, brilliantly illuminated within and without, resounded with shouts and toasts, songs and speeches. Processions were formed, and one particular hall having been selected as the place of rendezvous, the guilds assembled there. A silver goblet, chosen from the plate-chest of the corporation, was borne by the leaders in the procession, filled with sparkling wine, and quaffed in sign of the amity and harmony existing amongst the trades.

While these processions and festivities were enacted, the hills around the town were blazing with huge bonfires, in one of which an effigy of Winter was burnt. The figure represented a decrepit old man, with hoary hair, and a long snowy beard, enveloped in warm wrappings. It was borne about the town amidst universal derision and contempt; and finally, suspended over an enormous fire, it was consumed, while the people shouted for joy, and piled fresh straw and fagots on the flame, until not a vestige was left of poor old Winter but a heap of burnt-out ashes.

These are the usual ceremonies of the fête which are always observed, while each year some new sport is invented, adding fresh interest to the scene. These often take their rise in political events, local reforms, or social changes. The custom had fallen somewhat into disrepute, when, in 1819 A.D., it was revived with fresh vigour; and from this time it seems to have flourished in unbroken prosperity. Sometimes one guild took the lead, sometimes another; the processions were ordered with much care and forethought; beautiful coloured lamps were borne by the members of the corporations, on which were painted their arms and the insignia of their

trade; banners were embroidered, the halls beautifully decorated, scenic representations given of historical events, the costumes for which were carefully prepared; declamations and speeches both grave and gay were held, and imagination tasked each year to produce some novelty. While the citizens were thus busy in their guilds, the people caught the spirit, and added their part to the gaieties of the scene. Early in the morning, boats, adorned with flags, and steamers filled with peasants from the neighbourhood, arrived, all in gala costume, and the streets swarmed with festive groups.

In 1880, for the first time, processions passed through the streets in broad daylight, with bands of music, all who joined in them being attired in the costumes of the olden times. In 1888, the guild of the smiths undertook to solemnise a political change which had taken place in the canton, in which a young Zurich had been actively engaged in destroying old customs; in grief for these innovations, the guilds, headed by the smiths, bore their colours in funeral-procession to an elevated spot above the town, and buried them beneath a group of lime-trees.

We shall endeavour to give a more detailed account of two of these singular festivals, each of which was characterised by peculiar and interesting ceremonies. On one occasion, after a very severe winter, during which great hardships had been endured by the Swiss people, there seemed an unusually eager desire to make the *Sechse Luten* brilliant and imposing. As the spring broke with its promise of warmer days, and relief from the pressure of want, the joy of the people was unbounded; a general enthusiasm pervaded all parties: crowds filled the streets; and beggar and burgher, peasant and townsman, joined heart and soul in the rejoicings and festivities.

By noon, the burghers, in their plain but honourable craftsman-dresses, were seen hastening to meet their brethren at the well-furnished tables in their halls. After the dinner was ended, it had been arranged that the visits to the different guilds should then be paid, rather than defer them until the evening. The processions were marshalled accordingly. First came the butchers, in the full costume of their trade, attended by their apprentices, dressed as maidens; twenty-five of these bold butchers' boys bore on their shoulders a gigantic sausage, measuring fifty feet in length, and containing three hundredweight of the best pork, veal, and beef; across its aldermanic proportions lay two huge knives and forks, which subsequently served in the carving and distributing slices among the people. Next came the fishermen and boatmen, carrying on a large pole a fish of enormous dimensions; this proved to be a sham specimen of the finny tribes, which, when ripped up, showered abroad a quantity of perches and smaller fry, composed of sugar and sweetmeats. Amongst the bakers, a prize had been offered for the best and largest loaf; and in their procession, these prize-loaves were placed on gaily decorated carts, bearing other specimens of the skill of the Zurich bakers. The largest of these loaves was two feet wide, and ten feet long, and weighed 260 pounds. These guilds were succeeded by others too numerous to be mentioned particularly, each one bearing specimens of their particular trade—in wine, cheese, tobacco, and other wares. Before each division, a silver vessel was borne, filled to the brim with sparkling wine. About five o'clock, all the processions, after parading the town, formed into one line, and proceeded to the *Baugarten*—a kind of park on the shores of the lake. Here the sausage was cut up and, with the other good things, dispensed among the admiring crowds; and soon the bell was heard pealing forth its solemn tones, calling on all to join in one song of universal thanksgiving. As

night, fires blazed from the hills, fireworks shot their brilliant lights of varied tint high into the air, and the quiet stars shone brightly down on the scene—all lay reflected in the tranquil waters of the lake. Night deepened, the fires were burned out, the rockets were spent, the lamps dimly flickered, the crowds returned to their various homes; another winter had been dismissed into the abyss of time, and a new summer was opening on the joyous and grateful people.

The next *Sechse Luten* we propose to describe was celebrated in 1856. Expectation had been highly raised: it was noised abroad that preparations were being made on a scale of magnificence unequalled in former years. On the morning of the 7th of April, the city began to fill; steam-vessels from all parts of the lake arrived, bringing crowds of passengers; gay motley groups of peasants in their pretty picturesque costumes, ladies in fashionable attire; officers, priests, people of all ranks and ages. Hundreds of little boats covered the waters, and train after train brought new multitudes of eager spectators by the railway. This new means of conveyance, but recently established in the country, tempted thousands from all parts of Switzerland, so that Zurich had never before seen her streets so densely crowded.

Hitherto, these annual festivals had been peculiarly local in their character; this year, for the first time, they assumed a cosmopolitan form. The march of civilisation was felt even in the remote cantons of the republic; the spirit of innovation—that restless sprite whose influence no nation can resist—asserted her right to share in the *Sechse Luten* of Zurich. The guilds, inspired by one idea, agreed to unite in carrying it out in the best manner possible, and the result surpassed all expectation. Zurich was to be regarded as the centre-point of all the railways in the world; trains were supposed to arrive from all the four quarters of the globe, bearing deputations from all nations and peoples, who subsequently forming into processions, paraded the streets. Switzerland, with the strong prejudices peculiar to her national character, had long opposed the introduction of railways: at length one or two lines had been constructed, and the wild whistle of the locomotive, the whizzing and hissing of the steam, were heard resounding amidst her mountains and valleys, disturbing their peaceful tranquillity, yet bearing in their train blessings undreamed of by the alarmed inhabitants. It was a happy thought to mark this epoch; to bring before the Swiss people thus assembled from all parts the advantages which intercourse with other countries would bring their own, and, in sport, present them with pictures suggestive of so much future benefit.

The hour appointed for the opening of the festivities approached; every window and balcony was filled; the streets and roofs of the houses presented a dense mass of heads; the guild-halls gay with banners; music sounding everywhere; and all was gaiety and expectation. Suddenly the sound as of a rushing wind was heard; smoke curled in dense clouds from the chimney, the whistle shrieks, and the huge engine appears in sight, the *Miracula Spectaculara*, covered with the flags of the federal states. Eight carriages followed in its rear: the northern and north-eastern trains; the eastern and south-eastern; the southern and south-western; the western and north-western, bringing people from every country lying between the poles and the equator. Soon the streets were alive with the various groups which these trains had conveyed.

To describe the scenes which now followed each other in quick succession would be impossible; every moment brought a new party under notice, all mingling in seeming confusion, yet each retaining its

full costume from the Black Forest, from Saxony and Mecklenburg, &c.; here was seen a wedding-party from the rich Altenburger peasantry, with gaily dressed maidens and gallants on horseback; there, a gala-coach filled with Hamburg merchants and brokers, with a shipful of Vierländer (the people who live in the neighbourhood of Hamburg). These were followed by Danes, Swedes, and Norwegians; and bringing up the whole, Mr and Mrs Esquimaux were seen, seated in a fur-covered sledge drawn by six panting dogs. The north-eastern division sent forth vine-growers from the districts of the grape; a gay summer-party from Munich; carriages, laden some with nobles, some with peasants, from Bohemia; Berlin with her Kladderadatsch (the 'Punch' of Germany), guarded by a policeman in Prussian uniform; Polish droschkies, accompanied by noblemen on horseback. Then came the Emperor of all the Russias, surrounded by his staff and guard of honour, Cossacks and Bazouks; while a huge Russian carriage filled with nobles, a cart with serfs, brought up the rear. From the arctic regions there were Tongenses and Finlanders with their reindeer sledges, and the whole summer establishment of a Kamschatka family. Amongst the eastern companies were seen the brave lads and lasses of the Tyrol and Steiermark, with Viennese citizens in gay attire; a marriage-party from Appenzell and St Gall; proud Hungarian magnates in their splendid gala costume, on horseback; horse and cattle dealers from the Carpathians, and in their suite a troop of dark-eyed gipsies. The east sent forth her fair Circassians, Tatars on foot and horseback, with wandering families in tented wagons; even the Celestial Empire deigned to furnish representatives for this great world's assembly. A Chinese fair was arranged, and a mandarin in solemn state was borne in rich eastern litter; and a Japanese general followed, attended by the clang of martial music. New elements came to the fête with the southern train—Italian serenades and carnival antics, bright eyes glancing, and soft mandolines keeping time to merry dancing feet; English tourists in Italy, brigands and Swiss guards; a strain of delicious church-music, wafted, one knew not how, from Rome; peasants from the Campagna in all the glowing colours of the rainbow; pifferari, friars, and monks; lazzaroni and Neapolitan fishermen, Calabrians and Corsicans. The new civilisation of the south-east, headed by the Sultan Abdul Meschid, seated in a carriage surrounded by his new Christian allies; fair creatures from the harem, for this day unveiled, and exposing their charms to vulgar eyes; deputies from the Suez Canal commission, marching under a huge umbrella borne by Egyptian attendants; grotesque Bashibazouks, Greeks, pious pilgrims to the shrine of Mecca, Bedouins of the desert—all following in the sultan's train. Then came the dreamy fire-worshipper, the follower of Zoroaster; the Indian nabob in his palanquin; a carriage filled with colonists from Sydney; and Lola Montes, with her graceful arts and wiles, taming the savages of New Holland. Africa, too, sent Arabs from Sahara, Algerine pirates, and the dark negro from Nubia, with Caffres and Hottentots from the south. Then came the aborigines from New Zealand and South-sea Islands, tattooed and draped in feathers. In the south-western division came Savoyard boys, with marmots, and organs, and plaster-casts; a bridal-party from the south of France; muleteers and herdsmen from the Sierra Nevada, smugglers from the Spanish coasts, and piccadors ready equipped for the bull-fight. The Spanish islands were represented by slave-drivers and planters, and his serene majesty Soulouque from Hayti, attended with his dusky suite; merchants from Buenos Ayres; and giants from Patagonia.

The birth of a young heir to the French imperial crown was marked by a stork bearing a child in its bill, while market-women (*dames de la halle*) brought gifts to grace the event; Paris sent her grisettes and students, soldiers and civilians; and the peace congress—at that time sitting in Paris—was duly represented; the four great western powers solemnly seated in an open carriage, with Prussia and Piedmont standing as footmen behind, and Elihu Burritt and Cobden sitting on the box attired like *Mercuries*, each bearing a palm-branch, the accompanying servants dressed in green, the livery of hope. In the western train was Barnum, with his wondrous shows; while Mexicans and Red Indians closed the procession. England came in the north-western division, with her weavers and colliers; the queen and prince-consort in an open carriage; milors and miladys, boxers and engineers; a faithful impersonation of John Bull accompanied by Punch; while Irish beggars and Scotch *sans culottes* brought up the rear. The processions took more than four hours to pass through the streets of Zurich. The whole was closed by an enormous cosmopolitan omnibus, and a peace-battery, from which genii fired amongst the people rounds of shot, consisting of little rolls of bread. The evening's amusements were terminated, as usual, by corporation visits to the various guild-halls; toasts were drunk, speeches made; and thus ended the curious and interesting festival of the *Sechse Läuten* of 1856.

THE NIGHT BEFORE THE MOWING.

ALL shimmering in the morning shine,
And diamonded with dew,
And quivering with the scented wind
That thrills its green heart through—
The little field, the smiling field
With all its flowers a-blowing,
How happy looks the golden field
The day before the mowing!

All still 'neath the departing light,
Twilight—though void of stars,
Save where, low westering, Venus sinks
From the red eye of Mars;
How peaceful sleeps the silent field,
With all its beauties glowing,
Half stirring—like a child in dreams—
The night before the mowing.

Sharp steel, inevitable hand,
Cut keen—cut kind! Our field
We know full well must be laid low
Before its fragrance yield.
Plenty, and mirth, and honest gain
Its blameless death bestowing—
And yet we weep, and yet we weep,
The night before the mowing!

THE QUESTION BETWEEN THE FARMERS AND BIRDS.

The truth seems to be this: during the spring, birds do great good by killing insects on which they feed themselves and their young; but when the corn is ripe in the ear, and ready to shed out, the crowds of birds which flutter about on the tops of the stalks are said to beat out the grain in large quantities, which falls on the ground, and is wasted. Young birds should be killed down before harvest; there will generally be enough left to breed in the spring. Something analogous may be said as to rabbits. They do very little harm, if any, except when the corn begins to form its stalk, and when the green crops, as peas, tares, &c., begin to start; then they do considerable damage. They should therefore be killed down during winter, a few only being left to breed.

No. 239.

SATURDAY, JULY 31, 1858.

PRICE 1½d.

LETTERS.

THERE are few things by which the flight of time is more sensibly measured than by the difference of feeling with which at various periods of our lives we indite or receive Letters. In the dawn of life, indeed, as at its close, we have the greatest unwillingness to set pen to paper at all; but the causes of the disinclination are quite different. In those very early times, we are not perhaps confident about our *ps* and *qs*; whether our *h* should have a loop in them, or whether the personal pronoun should be a little *i* or a big one. Our spelling is entirely phonetic; and maybe we are not unconscious of our want of ear even for the attainment of *that* accomplishment; while, in addition, we are sure to have some misunderstanding with our own middle finger, which the writing-master requires us to straighten, and which Nature as imperatively demands shall be kept bent. Unhappy epoch of pothooks and hangers, how well do we remember it! when we could not persuade our teacher that a child could possibly be near-sighted, and 'Sit up, sir! will you sit up, sir?' sounded so implacably in our ears. How nose and chin followed closely that serious pen of ours in all its rounded turns and exquisite up-strokes! How our lips, through a sense of the overwhelming importance of the task, formed themselves into the shape for whistling—when whistling, goodness knows, was far from our thoughts—as it delicately dotted the *is*! How our whole face accompanied its horizontal movements, when it crossed—not the Rubicon, but—the Tees! Still, what we had to write, we wrote willingly enough; albeit, for the above reasons, and because composition itself was not at that time a very easy matter, our epistles were not of the longest; the paper superficies they covered was indeed considerable, but they did not in those early school-days contain much epistolary matter:

'MY DEAR MA—I am very well so is bob all our tin is gone, a cake would not be unexceptable we dont wet enough to eat dear Ma indeed. Love to Pa and Nero who i hope is looked after.—Your dutiful and affectionate son, JEMMY.'

We always accomplished that 'dutiful and affectionate' without mistake, on account of our having to send off a 'holiday letter' at the conclusion of every half-year, which ended with those adjectives. Doctor Whackem himself set the copy of this for the whole school, and looked over our shoulders with painful frequency during the epistolary process. What a number of fine sheets, with lines so carefully ruled

a hypocritical piece of composition it was when all was done, and how it smelled of india-rubber where they had tried to erase the pencil-marks!

'MY DEAR PAPA AND MAMMA—I am very well and happy here, for Minerva Hall is indeed a home to us; but I shall of course be very delighted to see you again. This is to inform you that the holidays begin upon the Friday after next, when Doctor Whackem will give out the prizes in the schoolroom at half-past one, D.V. The Earl of Reddiforaniman has consented, with his usual urbanity, to take the chair. I hope I shall please you, my dear parents, by getting a prize. Doctor and Mrs Whackem desire me to give you their kind compliments; and believe me to be your dutiful and affectionate son, JAMES GOODCHILD.'

It was a pleasure to write even such an epistle as that in those times, because of the holidays it heralded.

Then the Letters we received at school, how unexceptionably welcome they were to us, especially if they weighed somewhat heavier than usual, and cunningly and safely imbedded in the sealing-wax there was found the desired half-sovereign; or if they conveyed tidings of 'a parcel'—expression delightful in its very vagueness—already despatched to 'my dearest Jemmy' by the carrier, the contents of which were to be equally divided with our brother Bob. Alas! what memories the sight of one of those letters would awaken now; what regrets! what tears! We sometimes grudged poor Bob that equal share of his; we were glad when there were pots of gooseberry-jam sent—Bob didn't like gooseberries—and on all occasions drove too hard a bargain with him, he being the youngest. He never grew to manhood and to 'Robert,' but lived and died; and will be ever known among the rest of us—who are thinning by this time sadly—as our boy-brother, 'Bob.' There were no such associations about those school-letters then.

In our adolescence, letter-writing was even a blyther matter still. There was then never any necessity compelling us to it. Out of the abundance of our heart, the pen indited. Our honest thoughts, fresher far than afterwards—and not less true, perhaps, though somewhat crude—flowed from us without effort and without fear. What aspirations had we at that epoch, which—to our present shame, be it confessed—our cheeks would burn with self-contempt to hear now uttered by the friend to whom we wrote them; and he again had the like radiant visions, and laid before our sympathising eyes his own fond dreams of life. What vigour, what elasticity, what overflow of genial humour one must

Now, unless compelled by direct need, we never catch ourselves leaning over foolscap, except for a consideration.

Love-letters—what a splendid occupation the writing of those was wont to be! How pleasant to issue from our mental mint a thousand honeyed synonyms for the Beloved Object! How we lingered over each soft expression, toying with it tenderly as though it were itself the half-angelic being to whom it was addressed!

She is sixteen stone by this time, and her (second) husband's name is Potts, a drysalter; but that dread future was, in mercy, unrevealed to us at one-and-twenty.

Jones was in love with her also; and I have got one or two of his letters now, which the dear girl let me have at that time, in the strictest confidence.

What an unsuspecting, generous, impulsive, affectionate young fellow he must have been! (I hope Jones has not got any of mine, composed about the same epoch). Wizen, bloodless, grasping little money-seeker that he is, how *could* he have ever concocted such epistles! I can't fancy him inditing anything beyond 'Received yours of the 24th instant,' and 'I am, gentlemen, your most obedient humble servant;' by which he means their commercial rival, and most uncompromising foe.

I wonder whether it would be possible for a man to write a *bond fide* love-letter to a wife; I mean, of course, to his own wife, for in the case of another's (we have heard) the thing is practicable, and even easy enough. One couldn't have the face to call her an angel, although one might wish her in heaven; and as to her being addressed as a fairy—think of Belinda Potts, and a fairy of sixteen stone! The handwriting of dearest Belinda resembled a slanting shower of summer-rain; and when it was crossed, as it very often was, by another slanting shower, it was rather difficult to decipher. I think, however, that only enhanced the interest of her delicious meaning, which came out, when it did come, all the fresher, like a flower from the mist. I could detect her long-looked-for communications by more than one organ of sense before they left the postman's hand; their envelopes being pink, and redolent of patchouli. That was how I discovered that Belinda was corresponding with young Hitchins, as well as with myself and Jones. Hitchins was her first husband, and ran away with her from her paternal roof. I should like to see any unassisted individual attempting to run away with the present Mrs Potts.

When Cupid has once departed, taking with him the golden pen and the red (heart's blood) ink, there is no more joy in Letters. They henceforth become a matter of business only and of compulsion. We strive to trick the post-office by making a single stamp do double duty, and, on the other hand, grudge bitterly having to pay the least over-weight in the communications of our friends.

In our married and settled condition the postman becomes to us a daily nuisance. He brings earnest manuscripts from our wife's brother, who is in want of a hundred and fifty pounds for a special purpose, after which, he says, he will be an honour to the family; affectionate notes from our mother-in-law, who is looking forward to spending three or four months with her dearest Jemima, and her James, who

seems like her very own blood; circulars from charitable societies, who 'make no apology for appealing to our sense of Christian duty' (there are no such satirists as your philanthropic people). Worst of all—because reminding us in the cruellest possible manner of the genial past—college bills for wine, cigars, or other vanity we had fondly deemed to have been paid for years ago.

Then, as we grow to be more and more of a *paterfamilias*, more and more bills; we groan in spirit as our delighted daughters hasten at that dread 'rat-tat' (rustling those expensive morning-dresses of theirs), to open the letter-box. What contents they bring us, to spoil our matutinal meal, and to impair a digestion which is already in the most artificial state imaginable!

Here they are. Bill, Bill, Business, Circular (social), Circular (religious), Death (Poor Smith gone; our own age, too, within six months or so, and similar habit of body; horrible!), Bill, Bill ('I wish, Jemima,' tossing it over to the wife of our bosom, 'you would dress the girls more like young people of moderate means, and less like balloons; I won't pay for such foolery, that's flat'), Mother-in-law ('Here's your mother coming *again*; let *her* pay for them'), Business, Brother-in-law, Bills.

Alas, this laughing mask of ours conceals a sad countenance. The satirist of our own day who calls old letters the best satires in the world speaks a frightful truth. Unlock the old chest full of them, the old drawer, or the old desk, and cast your eye over the yellowing rubbish it contains. Open the worn covers, superscribed in the forgotten handwritings, and read the once welcome words spoken by hearts that have long been changed: your mistress's, 'she that married the nabob, and for whom you now care no more than for Queen Elizabeth;' or your beloved sister's—oh, 'how you clung to one another until you quarrelled about the twenty-pound legacy!' This humor of the modern humorist is terribly grim!

A genius, of our own day likewise, but of a very different kind, has written something worthier than this upon the subject of Old Letters—'of those fallen leaves which keep their green (he calls them), the noble letters of the dead.' He shows himself sitting alone in his chamber at late eve, when the rest of the house have retired, and when, without, 'the white kine glimmer, and the trees lay their dark arms about the field,' reading aloud the old letters of his dead friend: when, strangely on the silence broke the silent-speaking words, and strange was Low's dumb cry, defying Change to test his worth; and strangely spoke the faith, the vigour, bold to dwell on doubts that drive the coward back, and hush, through wordy snares, to track Suggestion to her inmost cell; and word by word, and line by line, the dead man touched him from the past, and flashed his living soul on his—— Thus he held awful converse, till the doubtful dusk revealed the knolls once more, where, couched at ease, the white kine glimmered, and the trees laid their dark arms about the field: till, sucked from out the distant gloom, a breeze began to tremble o'er the large leaves of the sycamore, and fluctuate all the still perfume; and gathering fresher overhead, rocked the full foliaged elms, and swung the heavy-folded rose, and flung the lilies to and fro, and said, 'the dawn, the dawn,' and

died away; and East and West, without a breath, mixed their dim lights like Life and Death, to broaden into boundless day.

A WEEK AMONG THE HEBBIDES.

SECOND ARTICLE.

IMAGINE a pretty little town of white-washed houses stretching like a semicircle round the head of a bay with a sunny western exposure—a background of irregular protuberances rather than hills, which terminate on the right in the woody heights and picturesque ruined castle of Dunnolly, and on the left by a similar piece of rugged scenery, amidst which, among embowering trees, are placed two or three villas: then, imagine that the bay is bounded so completely in front by a green and pastoral island, as to seem enclosed by the land, and you may have some notion of Oban—an object so calm, so pretty, so uncongenial on these wild and secluded shores, that at first sight it occasions an emotion of surprise. A little inquiry makes the stranger aware that Oban, like many other towns in the Highlands, is a modern Seso-Saxon settlement, founded for the purpose of improving the country; and that latterly, very much through the efficacy of Hutcheson's steamers, it has undergone considerable extension. Tasteful villas are perching themselves about on the rocky knolls behind the town; branches of banks and other commercial undertakings are being established; and hotel and lodging-house accommodation is recently much enlarged. Already, I have spoken of the Caledonian Hotel as a high-class establishment; but there are some other good hotels for tourists: I am, in short, told that the town can accommodate five hundred strangers, and that, by casual visitors alone, as much as £10,000 is spent annually in the place.*

Two objects of much antiquarian interest in the immediate neighbourhood, the ruined castles of Dunnolly and Dunstaffnage, usually attract the notice of visitors. By the politeness of the proprietor of Dunnolly, the small party of excursionists of whom I formed one, were permitted to visit the ruins, which, clothed in ivy of the brightest green, and placed on the summit of a huge rock overlooking the sea, form a beautiful and imposing feature in the landscape. Dunstaffnage Castle—gray, massive, and of greater historical interest than Dunnolly—is situated at the distance of three miles from Oban; and being shewn by a resident keeper, it can be seen at all times with no more trouble than a short walk or ride. No stranger should omit visiting Dunstaffnage, for independently of its connection with events during the old Scottish monarchy, and its being the original repository of the famed Stone of Destiny, now forming part of the coronation-chair in Westminster Abbey—the scenery around, a happy blending of sea, rocks, islands, and lofty mountains, of which Ben Cruachan is the most conspicuous, cannot fail to evoke the most pleasing emotions.

It is time, however, to be getting on. While I have been talking in a very rambling way about how tourists are to transfer themselves to Oban, and of some things that are to be seen there, the *Mountaineer*, distinguishable, like all other of the Hutcheson boats,

by its red funnels, is hissing and snorting at the pier like an impatient Highlander, and threatening to break away and be off on what was intended to be a special cruise among the islands. It is a summer morning in the end of June, and our party, seven in number, having hastened from the hotel, are now on board; the hissing ceases, the paddles begin to rumble, and in five minutes we are steaming at the rate of nearly eighteen miles an hour down the Sound of Kerrera. It was a very joyous-looking day, bright patches of sunshine interspersed with deep shadows on the hills of Lorn; the air crisp and dry; and the sea in a tolerably well-disposed mood.

Our first destination, of course, was Iona, 'that illustrious island, which was once the luminary of the Caledonian regions, whence savage clans and roving barbarians derived the benefits of knowledge and the blessings of religion.' To reach this classic spot, steamers proceed from Oban according to wind and tide, either round the north or south side of Mull: if by the northern route, Staffa is first visited; if by the southern, Iona—the usual practice, we believe, being to go one way and return another; by which means the tourist circumnavigates Mull, and has an opportunity of seeing, close inshore, various lofty and jagged precipices, and several ruined castles standing in desert loneliness on half-insulated peaks over the white foam which dashes on the iron-bound coast, while far above and beyond these objects he will have a view of huge, misty-topped mountain masses, one of which, the giant of a particular group, attains the height of 3000 feet. The voyage to Iona, by the shortest or southerly passage, ordinarily occupies about four, but on the present occasion, it was effected in three, hours. We left Oban at seven, and at ten were in the Sound, a mile in width, which has the Rose of Mull on the east, and Iona on the west—the isles of Colonsay and Jura being seen far away in the south. At this point, the territory of Mull sinks into tameness, and offers some scope for cultivation, with space on the level shore for a village, whence there is a boat-ferry to Iona, which, at a glance, we perceive to possess the same unpicturesque features as the opposite coast.

Running up within a hundred yards of the island, a boat is seen to put off, manned by two or three natives, the leader of the crew being Alexander Macdonald, an intelligent and obliging Highlander, who speaks English, and acts as guide and interpreter to strangers. Approaching the shore, which is covered with big boulders partially overgrown with sea-ware, and over which, on landing, we pick our way to the dry sward beyond, we perceive that, in the present day, the island of Columba is a simple pastoral bit of land, rising in the middle to a height of two or three hundred feet, and with a slope towards the sea, on which is concentrated within a space of a hundred yards all that is interesting to visitors. But, then, such interest! Standing right in front of this gentle slope we have, first, close on the shore, a row of low huts covered with thatch, a species of roof not seemingly able to encounter of itself the gusts occasionally blowing from Mull, since it is enshrouded in a netting of straw-ropes, held down by big stones, in a manner rather threatening to the heads of the Celtic children, who are sprawling about in their little kilts before the smoky doorways of the clachan. It is proper to understand that this collection of some forty hovels is called, in Gaelic, Baile Mor, or the Great Town. I have no doubt that it is considered by the natives a very fine city, more especially as it possesses a slated house at the south end, where refreshments of a simple kind are dispensed. Baile Mor contains no inn, nor are any spirituous liquors sold within it, on which account it requires no policeman or magistrate.

* Parties under any difficulties respecting their movements, may apply to Mr. McArthur, agent at Oban for Hutcheson's steamers. His office is on the quay, and he will be found an

little distance, on a rocky point of the shore, stands a newly built Free Church; and scattered about behind the village are an Established Church, a parish school-house, and manse for each of the two ministers. These last-mentioned buildings, which are of respectable dimensions, are, I believe, the only dwellings in which lodgings may be obtained by persons who desire to make a deliberate inspection of the island and its curiosities.

Let us have a look, however brief, at what distinguishes this otherwise uninteresting island. Partly behind the row of thatched huts, and partly a little to the north, amidst enclosures of low stone dikes, are a series of ruins in three detached groups, to which we gain access by a rude kind of pathway, environed by the patches of potatoes and corn of the humble villagers. Guided by Macdonald, we do not reach the ruins in the order of their antiquity, but according as they happen to lie. The more southerly group reached first in the series, is a nunnery, of which the chapel, with walls tolerably entire, is the principal remnant. This monastic establishment for females is said to have been founded in the early part of the thirteenth century, a date almost indicated by its finely rounded Saxon arches. Within and around it are some flat tombstones commemorative of prioresses and ladies of rank who were here interred. On one, considerably mutilated, the sculptured figures are exceedingly fine, representing the last prioress; her head supported by angels, and the figure of a little dog on each side—indicating, possibly, that she had been attached to these animals. The date of her death is 1548. Turning round an angle of the building after examining these relics, there stood before us, ranged demurely along a wall, about a dozen little girls, each holding in her hand a small plate of pebbles and shells, which were silently offered for our inspection and purchase. There was something affecting in the attempt of these poorly clad, but clean and orderly children, to pick up a few pence in exchange for the only articles they could find for sale, the coloured stones—bits of serpentine, quartz, and feldspar—which had been worn by the attrition of ages on the shore of the adjacent seas. We selected and purchased some of these tiny fragments; but on giving a shilling to be divided among the party, we were disconcerted to find that the girls did not understand a word of English—a circumstance not very flattering, I must needs think, to those who charge themselves with their education. Luckily, Alexander Macdonald made them all happy, by translating and explaining our intention. Strangely enough, it is alleged that the custom of offering pebbles and shells for sale dates uninterruptedly from the period when pilgrims to the shrine of Columba piously bore away relics of the saintly island; morsels of serpentine, in particular, being prized for the purpose of being set in rings, which possessed a certain protective virtue against divers accidents and misfortunes. Wordsworth, it will be recollected, alludes in one of his sonnets to the pebble-sellers of Iona:

How sad a welcome! To each voyager
Some ragged child holds up for sale a store
Of wave-worn pebbles, pleading on the shore
Where once came monk and nun with gentle stir,
Blessings to give, news ask, or suit prefer.

The next group of ruins to which we are admitted is that of St Oran's Chapel, being apparently a sepulchral chapel in the midst of the burying-ground, which had received the remains of Irish, Scottish, and Norwegian kings for several hundred years, besides those of abbots, bishops, chiefs, and others who had deemed it an honour to be entombed in what, during the middle ages, was one of the most noted resorts of learning and piety in Western Europe. Several rows

of flat tombstones, sculptured and in good preservation considering the usage they have received from iconoclasts and fanatical relic-hunters, are pointed out by the guide; the whole being of a durable species of mica slate, but gray, and partially covered with vegetation. Eight hundred years ago, this spot of earth received the mortal remains of Duncan—an historical event of which Shakespeare, with his usual tact, makes proper use:

Rosse. Where is Duncan's body?

Macduff. Carried to Colme's-kill,
The sacred storehouse of his predecessors,
And guardian of their bones.

The various names given to Iona can hardly fail to perplex a number of tourists. On the tombstones, it is uniformly called by a word formed of the single letter I or Y—pronounced *E*. Colme's-kill, sometimes written Icolmkill, signifies the cell of Colme. Latinised according to the mediæval usage, Colme becomes Columba, and I is euphonised into Iona. The real name of the island, therefore, is I, or, in pronunciation, *E*. While so called, it became in 563 the chosen residence of a handful of Irish missionaries, who, under the charge of Colme, their gifted superior, introduced the knowledge of Christianity into Scotland. Of St Colme, or Columba, however, the island cannot with certainty shew any trace. The early and simple edifices of the apostolic band were merged in edifices of a more aspiring kind, which sprung up under the ritual of the Church of Rome. The nunnery, as already seen, is a comparatively modern erection, and so is the third or last group of buildings to which we are conducted, consisting of the cathedral, which latterly became the seat of the bishops of the Isles. This edifice is the most imposing of all the ruins. Its tall square tower, seen at the distance of several miles, rises from the centre of a cruciform structure, of different ages—in the older Saxon arches there being added the pointed Norman, along with decorations of a still later period. It will be for ever matter of regret that the rage for indiscriminate destruction which marked the Reformation in Scotland, should have been carried the length of pulling in pieces all that was artistically beautiful, all that was consecrated by learning and religion in Iona. Buildings were destroyed, clergy and educators chased away, piles of documents of vast historical value dispersed, and the island allowed to lapse into barbaric rudeness; the only parties benefited, as was usual in such cases, being those singularly disinterested personages who accepted from the crown gifts of the varied patrimony of the colony of Columba. After much dilapidation, some care has been taken by the proprietor, in conjunction with the Iona Club, to secure the ruins from utter demolition; nevertheless, it is painful to say that the whole place is kept in a shabby, ill-assorted condition, and if something be not done to secure by masonry several finely groined vaults, damp and decay will speedily lay them prostrate. Both in going to and walking about the ruins of the cathedral, the visitor sees several upright crosses, consisting of slabs of sculptured slate; such being everything that remains of some hundreds of similar elegant objects with which the island was at one time adorned.

Once more on board, the *Mountaineer* steamed rapidly out of the Sound of Iona, with her bows pointed in a northerly direction to Staffa, which was seen right ahead, at the distance of six or seven miles; the view towards the east disclosing Ulva, with the small island of Gometra, at the opening of a bay on the coast of Mull. As Ulva, like Staffa, is a basaltic formation, we now may be said to have got into an archipelago of a very remarkable kind.

geologically; it being far from improbable that the whole is but part of a range which comprehends the Giants' Causeway. Perhaps nothing more strikingly marks the low state of public intelligence which prevailed eighty to ninety years ago respecting the Western Islands, than the fact that Staffa was then unknown as an object of scientific interest. Pennant, who made his journey in 1772, did not land on the islet; he only speaks of seeing it at a short distance. Sir Joseph Banks visited it a month afterwards; spent two days on it, having brought a tent for the purpose; and he was really the first man of science who became acquainted with its wonders. Before either Pennant or Sir Joseph had made any public statement of their discoveries, Johnson and Boswell visited the Hebrides; and, strange to say, they knew nothing, and were told nothing, of either Staffa or Ulva. Boswell observes that when about to quit Col, 'they were informed that there was nothing worthy of observation in Ulva;' and so they took boat to the small island of Inch Kenneth, on their way to Mull. It may be doubted whether these wandering philosophers would have cared much for seeing Staffa, even if they had heard of its natural marvels. Johnson had no regard for scenery, however grand; he liked to go from one private house to another, conversing about social and political questions; while, in his peregrinations generally, he was at the mercy of any one who had a boat, and would, as circumstances served, generously send him on from island to island. However this may be, the fact is certain, that not till 1774 did the world know anything of Staffa, of which Sir Joseph Banks, in a burst of enthusiasm, says, 'compared to this, what are the cathedrals or the palaces built by men?—mere models or playthings, imitations as diminutive as his works will always be when compared to those of nature.'

Staffa makes no great appearance from the sea. It is only when we get near it that the grandeur of its character becomes apparent. Ordinarily, boatmen with boats from Ulva are in attendance to land passengers from the steamer. When the sea is calm, they conduct their boats to the inner extremity of Fingal's Cave, which penetrates a high precipitous cliff with a southern exposure. On the occasion of our visit, the sea was too turbulent to admit of our taking this liberty. A boat from the steamer landed us on a lower part of the rocky shore near what is called the Clamshell Cave; and thence we climbed to the grassy surface of the island. We were enabled to make this ascent by means partly of a wooden flight of steps, that forms one of several appliances with which Mr Hutcheson has provided the island for the convenience of passengers by his steamers. To leave nothing in this respect undone, he has leased the island, and sublet it at a loss for feeding sheep, of which we saw a few browsing about. The surface is irregular, shelving generally down in a northerly direction with a kind of ravine in the centre. The only appearance of a human habitation is the open ruin of a hut on the higher grounds; and besides its sheep, the only inhabitants of the island are various kinds of sea-fowl, which are seen in myriads, hovering and screaming in front of the precipitous headlands. To have a view of Fingal's Cave, the party walked along the tops of a lower range of basaltic columns—not very even footing—which skirts the shore on the east, and in a scrambling fashion got safely round to the cavern. The description of this wondrous recess—70 feet in height and 230 feet inwards—has been so often given, that it would here be superfluous to offer any account of it. By means of a rope, held by iron bolts to the rock, visitors with nerve to do so, may walk on the slippery tops of columns some way within the cavern, about half-way from the water to the roof.

crested billows rolled angrily inward, dashing themselves on the irregular sides, and surging up in masses of foam on the further end of the gulf. The Queen, on her visit to Staffa a few years ago, was so fortunate as to be favoured with that degree of calmness in the ocean which enabled her to be rowed in a boat to the innermost recesses of the cave, a feat in which her Majesty shewed her usual intrepidity.

For the sake of science as well as art, it is to be regretted that there are no means of making a protracted stay in Staffa. During the necessarily short time allowed to tourists, they can just see that the whole island is a mass of basalt, broken irregularly into columns, perpendicular and sloping, some large and some small, some entire, and others which, being broken off midway, offer a convenient footing to visitors in their rambles about the shores. A regular inquirer into basaltic phenomena would, however, need to extend his investigations far beyond Staffa. Besides the curious formations of Ulva, there will be found fantastic groupings of columns on the coast of Mull, Skye, and Eig; those in the latter island being of magnificent dimensions, towering as they do to the height of thirteen hundred feet above the level of the sea.

From Staffa, the *Mountaineer*, still early in the day, steamed her course northward; passing on the left Tiree and Col, and on the right Ardnamurchan, a bold headland, the most westerly point of the mainland. We then proceeded towards the Sound of Sleat, leaving on the left the conspicuous islands of Muck and Eig, and more distantly the island of Rum. Entering Sleat Sound, we had on the right successively the districts of Moidart, Morrer, and Knoydart—all bold, rocky, and with huge hills forming extensive pasturages; the coast being indented at several places with long withdrawing lochs, of which Loch Nevish seemed to be the most extended. On the opposite or northern side of the Sound was that part of Skye called the Point of Sleat, near which, amidst plantations, stands Armadale Castle, the seat of Lord Macdonald, the principal proprietor in the island. Although passing quickly up the Sound, we could see that on each side beyond the sphere of his lordship's grounds, the slopes of the hills were dotted over with the diminutive thatched huts of that aboriginal race of crofters whose miserable existence is an anomaly in the middle of the nineteenth century.

In the afternoon, a drizzle came on, the mists settled down on the summits of the hills, from which and other appearances, it was judged prudent to cast anchor for the night in the small and well-sheltered bay of Eillan-Oronsay, in Loch-na-dall. Here the *Mountaineer*, accordingly, came to a pause about a hundred yards from the shore. The idea of lodgings for the night at a small inn was suggested, but overruled. The steward had provided bedding for the sofas in the saloon, and could accommodate us all nicely; so there was no further trouble on that score. It was proposed that after dinner a good deal should be done in the way of fishing over the side of the vessel, with lines provided for the purpose at Oban. But, here, again, anticipations expired in talk. The evening was pronounced rather moist for any amusement of this sort, and lighted candles and what for a time banished the notion that we were moored within hail of a state of social life which had not been seen in England since before the landing of Julius Cæsar. A long day's exposure to the air made us all sleep soundly. On retiring, if such a phrase may be employed under the circumstances, a law was passed enjoining heavy penalties on snoring, a crime which, as it turned out to the credit of the whole party, no one was even in the most distant manner charged with.

Next morning, betimes, all were alert. At seven,

continuation of our cruise. A council being called, it was resolved to proceed first up Loch Houra, an arm of the sea projected eastward into Inverness-shire from the Sound of Sleat, and which is bounded on the north by Glenelg, and on the south by Knoydart. Loch Houra is so rarely visited, that to nearly all on board the excursion was perfectly new; nor probably would it have been quite safe, if we had not had the good-fortune to have with us a retired veteran in Hebridean navigation—Captain McKillop, who, it may be noted, was the conductor of her Majesty when visiting the Western Isles.

On entering Loch Houra, which varies from a mile to less in breadth, we are struck by the picturesque mountain masses, here swelling into rounded pastoral hills, and there rising into lofty jagged peaks, from which, down precipitous gullies, dash long foaming cataracts that, from their whiteness, resemble at a distance streams of milk, while around the more elevated hill-tops, at the height of a thousand feet, play the morning vapours not yet dispersed by the sun. On the lower braes, browse flocks of Cheviot sheep; and these, with the figures of shepherds and their dogs, not less than the absence of smoky huts, plainly tell us that Knoydart has passed into the hands of an improving low-country landlord. The scenery, interspersed with natural oak and hazel, continues beautiful as far as the steamer can advance. At a turn of the loch, a boat having been sent ashore to a village for a native pilot, the vessel securely passed into an inner reach of the loch, up which it proceeded to nearly its furthest limits. Here, on the south side, the party landed, and, favoured by a bridle-path, which, by and by, widened to a sufficient breadth for carriages, we walked several miles to the pass into Glen Quich, a gorge in the mountains environed with huge isolated rocks and boulders strewed about in all the rude grandeur of nature. Retracing our way, and again on shipboard, the vessel proceeded by Glenelg Bay into Loch Alsh, and then struck up Loch Duich, the mountain scenery at the upper extremity of which transcended, as we thought, even that of Loch Houra. At the entrance to Loch Duich, situated on a rocky knoll on the beach, are the ruins of Eillean-Donan Castle, an ancient seat of the Mackenzies, 'high chiefs of Kintail.' On the same side of the loch, in Loch Alsh, are seen various modern improvements, including the mansion and new inn of Balmacarra.

About this spot, the channel between Skye and the mainland makes a sudden turn, and the steamer shortly passing through the strait of Kyle Akin, where there is a ferry, enters a wider Sound, and for our gratification turns to the right up Loch Carron. The scenery on this loch, which is about twenty miles long, is no doubt fine, exhibiting here and there along the shore good specimens of raised beaches; but we are by this time not a little spoiled for sights, after Houra and Duich, nothing of the loch nature will pass muster; and returning to the more open Sound, we hasten on to Portree in Skye, where we are to pass the night. This part of the voyage was made by first touching at Broadford, where there is an inn, and then, after rounding the north of Scalpa, proceeding past Raasay, on the shore of which island stands Raasay House, a handsome modern mansion—an improvement on that in which Johnson was hospitably entertained; the estate having passed from the hands of the Macleods into the possession of Mr G. Rainey, by whom great changes for the better have been effected.*

* It will be recollected that Johnson and Boswell went in an open boat, manned by four stout rowers, from Corriachachin, near Broadford, to Raasay, the doctor, as Boswell says, sitting high in the stern, 'like a magnificent Triton.' Malcolm Macleod, one of the Raasay family, celebrated in the year 1745-6,

The harbour of Portree, so completely enshrouded by jutting high grounds as to afford the best shelter to vessels, received ours for the night, and all was ashore to Ross's Hotel, a house offering good and extensive accommodation. Portree—a name dignifying King's Port, being so called from a visit of James V. of Scotland, on one of his western excursions—is a substantial little town occupying the brow of a high ground overlooking the harbour. The place was thrown somewhat into confusion with the unexpected visit of the *Mountaineer*, but the inhabitants gradually subsided into tranquillity, and unmolested we rambled about the neighbourhood in search of anything to look at. The only objects which attracted us were a recently erected octagonal tower, on a conspicuous height, destined to ruin from sheer neglect, and on some low ground a parcel of those diurnal straw-covered bignings of which we had seen distant specimens on the coast of the island. Aided by an interpreter, a gentleman and I ventured on paying our respects to the inmates—but such a scene of dirt and poverty presented itself as filled us with horror and compassion. Bare stone walls, rafters overhead glittering with soot, and in which a few fowls were perched, the smoke of a peat-fire in the middle of the floor, finding its way out by a hole in the roof, window-holes, and door; the sty-lie beds, straw and dingy blankets huddled in confusion; the clay floor and ragged yet healthy-looking children. In only one of the houses was English spoken. And how do these wretched people live? Small patches of ground under crop, but ill cultivated, and showing about as many weeds as stalks of corn or potatoes, as their principal reliance, along with fishing or earning any odd jobs that come in the way. In one of the huts, on looking into a gloomy recess separated from the rest of the apartment by a few ill-patched boards, we saw a man lying ill—a sad spectacle of human desolation. The only house in which there was an effort at cleanliness was that in which English was spoken. The inmates here appeared to labour under the like desperate poverty; yet there was an air of the most pious resignation to what was probably felt as a dispensation of the Divine will. I could almost wish that habitual grumblers about trifles had been with us on this occasion. On one side of the peat-fire, which, as usual, was in the middle of the floor, sat an aged and lame man, the father of the family; on another side was the old mother, curling wool; while on a kind of cushion on the ground, with legs drawn up and helpless from rheumatism, we placed their daughter, who, according to her own account, had been so addicted for the space of ten years. Administering on our departure some slight gratuity to this unfortunate being, the melancholy consideration was forced upon us that the old crofting system, which is throughout signalised by this depressed and hopeless kind of existence, is totally wrong, and should be obliterated at every available opportunity. Situated as they are, the poor people of whom we had a specimen, can neither do any good for themselves nor in any sense benefit mankind, and but for what to many may seem a certain degree of harshness, they would absorb in the form of poor-rates more than all the rental of the land. The common sense of the country, I should think, must come to this conclusion

acted as pilot, and sang a Gaelic song, which was chorused by the boatmen. 'We sailed,' adds Boswell, 'along the coast of Scalpa, a rugged island, about four miles in length. Dr Johnson proposed that he and I should buy it, and found a good school, and an episcopal church (Malcolm said he would come to it and have a printing-press where he would print all the lies that could be found). With such lively chat, did they try to mitigate the terrors of what seems to have been a very boisterous sail of several hours. In the present day, one of Hutchison's steamers would have carried the party from Broadford to Raasay in an hour, as easily as an oarboat would take them from Charing Cross to St Paul's.

at last. Cruel as it may appear, there is nothing for the poorer inhabitants of Skye, and some other portions of the Highlands and Islands, but emigration. It is true, an outcry has been raised against expatriating an old race, for the sake of depasturing their lands with sheep for a southern market; but let any one visit the smoky hovels which are scattered along so many damp and unreclaimed hillsides, and see how utterly hopeless is the condition of their inhabitants—their very contentment being not less an evil than the language which cuts them off from any chance of intercourse with the busy world beyond—and seeing all this, say whether the removal of this Celtic population to scenes calculated to evoke their latent energies would not manifestly be a blessing.

Having caught a few glimpses of the Storr, the Cuchullin Hills, and some other striking features in the scenery of Skye, we returned with the *Mountaineer* to Oban.

In this voyage homewards, the vessel, after passing Ardnamurchan, proceeded down the Sound of Mull, by adopting which we were afforded an opportunity of calling at Tobermory, a neatly built modern town within a sheltered bay on the north-eastern shore of Mull. On the opposite and equally bold coast of Morven, a part of the mainland adjoining Ardnamurchan, we observed in succession, placed on craggy steepes overhanging the sea, the ruins of three old castles—Mingarry, Aros, and Ardtornish; this last the scene of the opening passages in Scott's *Lord of the Isles*, having been the residence of the proud chieftain of Lorn, whose

Turrets' airy head,
Slender and steep, and battled round,
Overlooked dark Mull! thy mighty Sound,
Where thwarting tides, with mingled roar,
Part thy swarth hills from Morven's shore.

On the point of Mull, at the entrance to the Sound, are the remains of another of these strongholds, Duart Castle, an ancient residence of the chief of the Macleans. On the point of Lismore, a long green island which we skirt on the route to Oban, is seen another picturesque ruin. Associating these old Hebridean fortlets, places of importance in their time, with Dunnolly and Dunstaffnage, Dunvegan in Skye, and other remains of a similar nature—all admirable studies for the landscape painter—along with the still more touching ruins of Iona, the conviction arises in the mind that here, in this western region washed by the waters of the Atlantic, and in ages long past, there existed a state of refinement, which receives little notice in the page of ordinary history—in fact, we see what till this day is so very limitedly known in the eastern and more populous districts of Scotland, that the sight for the first time, not only of these decaying remains of art, but of the grand and more imperishable features in nature, comes upon one with something like the effect of a revelation.

A special object with us in returning to Oban, was to visit the sinuities of the Linne Loch as far as Lochail and the entrance to the Caledonian Canal; and this was pleasantly accomplished by the *Mountaineer* in the space of a single day. What tourists have an opportunity of seeing in this accessible quarter, has been already hinted at—Glencoe, the scene of the unprovoked and horrid massacre of the Macdonalds in February 1692, being alike for its historical interest and sublime physical features, a spot pre-eminently deserving of a visit.

An impression left on the mind by a Hebridean excursion is, that the world generally is as little aware of the deeply interesting character of the scenery of the western islands and coasts, as of the comparative ease and inexpensiveness with which a pretty length-

appliance, can now be effected. Another thing which, being pressed on our notice, affords no little satisfaction: I allude to the obvious improvement of the country, mainly, as we learn, through the transfer of property to men of capital and enlarged intelligence, from England or the Lowlands of Scotland. In sailing about, you can always see at a glance, by the erection of substantial villas and farmhouses, the clearing and draining of fields, the growth of plantations, and the building of piers and wharfs, that energetic Anglo-Saxon minds are busily at work; and that at no distant day, by the gradual thinning of the numbers of the aborigines, the state of the Highlands and Islands will be entirely changed, of course vastly for the better. It is very pleasing to know that the progress of improvement is found to be compatible with the preservation of much that is picturesque and admirable in Highland costume and character; and perhaps I do not exaggerate in saying, that many of the new English proprietors are in this respect, by adoption, more patriotically Highland than the Highlanders, and possess as keen an appreciation of the matchless scenery to which they have migrated as the Celt of twenty generations.

W. C.

A SCREW OF TOBACCO.

AMIDST the whirlwind of the late tobacco controversy, any statement irrespective of party, illustrative of that unfortunate narcotic, would have been listened to by either side with impatience. Now that the storm has somewhat abated, all the smokers who are likely to be convinced at all having given in their adhesion to moral and medical authorities, and the rest being beyond the power of eloquence—a brief narration, having tobacco for its subject, may perhaps be borne. Being merely annals and impartial history, we say, the author of that celebrated tract, entitled *The Pipesmoker's Fate, or the End of a Cigar*, may appreciate the information we have to give him, equally with the wretch who may read it with a Havana in his mouth.

We are tobacco-merchants ourselves, and therefore open to the charge of prejudice if we took it in hand to give our own account of this matter; and we have accordingly selected the most sagacious-looking of the very oldest bundle of cigars we have in our possession, and requested him to narrate to the public his own story:

My ancestors first visited this country under the auspices of Sir Walter Raleigh; they were at that time foreigners, nor, indeed, are any of the thousands of us born and reared here, acknowledged to be sons of the soil up to this present writing. By a pleasant fiction of the tobacco-dealers, readily entered into by their agreeable patrons, we are supposed to be indigenous only to alien climes. As a matter of fact, we flourish almost everywhere. The American branch of our family is supposed to be the best—a word which signifies in that country, as in this, the richest. In Virginia, we are the *crème de la crème*, the weed of weeds. Next to that favoured region, perhaps Kentucky is entitled to make her proud boast of us. From Maryland we come with light bright faces, and are exceedingly esteemed in this country. Those of us who belong to South America differ much from their northern brethren. Brazil tobacco is a very short scrappy-looking leaf of the family tree, and is covered with the sands of the plains. That of Columbia is more tolerable, and of a fair complexion. German tobacco is a poor relation whom we are loath to own, with a most prolific growth—which poor relations always have—of dark-coloured leaves with little flavour.

the heads of our family there reside, respected and esteemed, and emitting a most agreeable odour. Yarn, an independent member of our race, with a dry—almost sarcastic—amontillado kind of disposition, has also his admirers. In Turkey, we are very bright coloured and sweet tasted, without having, however, much strength in us. Latakia is an especially aristocratic, enervated, listless species of this description. Greek, Hungarian, and Chinese tobacco assimilate to the Turkish. In Java, we are said to be 'of volcanic growth and gutta-percha flavour'; an evidently malignant and exaggerated definition, invented, as is most probable, by a detected cabbage; in Holland, we are very respectable; but all these latter branches of us can be purchased in the London markets at from 8d. to 7d. a pound.

The great object of the manufacturer of tobacco is to make a mixture of us that will stick together, and absorb as much water as possible without our getting absolutely mouldy and fermenting—through sheer sulkiness and indignation, and when all bounds of endurance are passed. One species of us, cut by itself, is too strong; another is too mild: one will break to pieces in cutting; another bears to be pulled about in all directions. Different proportions of us are used in different seasons, in summer, in autumn, in winter. The quantity of water each kind of us will imbibe is calculated to a drop, and its increased weight known to a fraction; the profit is confined to one or two per cent. At first, a moderate quantity of water was applied to moisten us; now, the demand for cheapness, and the increased competition, compel us to derive one-third (nearly) of our total weight from moisture, and drive us, as it were, to drink, whether we will or no. The ancients may have had perhaps a higher moral standard for their commercial transactions; the moderns must needs have a sliding-scale of principle, it seems, unless they would visit Basinghall Street, and we suffer from the times. The genuine Yankee tobacco won't take much water; but the German—poor stuff enough in its natural state, without any Anglo-Saxon blood in him—soaks like a sponge: these two, therefore, are mixed together, and other growths are added of all kinds. Next to making us heavy, the great object is to render us 'flescy,' so as to be held up in a large piece of several pounds-weight together; for the retail shopkeepers will not buy us when we are 'short,' as it is called, for then being weighed and sold out in small quantities, but too much of us becomes dirt and dust. The object of the importer is of course to get a perfectly dry leaf, so that the enormous tax upon us may be levied independently of any weight of moisture. He buys us from samples drawn at the Custom-house, and very queer stuff we look when he takes us for the first time out of our bales. These bales, by the by, are generally made of the hides of the animals of the Pampas, and are sold, on account of their enormous strength, to oyster-dredgers. We resemble, on our first release, shut up fans, of the colour and texture of dried badlocks; we are then called 'hands,' on account of our possessing five leaves, or fingers, upon each stem; but so brittle are we, that we can't bear even shaking.

We suffer ourselves, however, to be softened by steam, and in the thus warmed state, become perfectly pliable and supple. Our backbones, or stalks, are then extracted; we are next mixed together in great cakes, squeezed in hydraulic presses until rendered solid, and then subjected to an improved chaff-cutter, which chips us, with the perfectest regularity and dispatch, to any degree of fineness. When cut, we are passed through a steam-chamber, which expands us a good deal, then—having been shaken about on a heated copper, and all objectionable foreign substances being removed—we remain cooling in little

mole-hills for twelve hours or so, and are then ready for sale. Our leaf, cut without the central stalk, is called *Shag* tobacco; when cut with it, *Bird's-eye*. Different prices are caused by certain varieties in colour and flavour; and to produce them, we have to be sorted, out of an original imported case.

Cigars are made from different kinds of tobacco: Havana, Cuban, Yarn, Columbian, and German are most generally used. Each cigar consists of three parts; the interior is composed of what is called 'fillers,' with scraps of leaf of every sort and kind, this is surrounded by a tolerably large piece, which is yet not good enough to form the outside 'wrapper,' and this last, selected for its beauty of appearance and smoothness, is the mummy cloth which encases the whole. There is great difficulty in getting leaf to 'dress itself' well enough for this purpose; it is apt to look shabby and torn, and scarcely decent. German leaf makes the neatest and cheapest wrapper. Both the inside and outside of a cigar are of course made of materials varying as their price. A cigar that sells at threepence, is made of Havana leaf and out; one at twopence, of Cuban inside, and German out; one at a penny, of German inside and out; or, as some assert, of straw inside, and cutbagg out; but that has nothing to do with us.

When we are rolled into cigars, we have our aliases bestowed upon us then pickpockets; 'a good deal of water, and a great many names,' as the song says. Your twopenny cigar, for instance, is *Woodchuck*, alias *Hayden*, alias *Cabana*, alias *Tropica*, alias *Mama*, and is a scam of the deepest dye. Names mean absolutely nothing. Boxes, brands, and labels are all imitated, or made up by the junior clerks of the Spanish dictionary.

Foreign cigars are rarely met with in any quantity, the price being so very great that dealers scarcely care to keep them. They pay nine shillings a pound duty, and cannot be sold under fourpence each. They are superior to those of home-made appearance, in consequence of having been made up soft, and dried gradually upon their voyage from Havana; the material also being in that country of comparatively little value, only the best parts are used. Otherwise there is no reason why they should be better than the best English cigars made from the best foreign leaf. The foreign cigars are packed in hexagonal bundles of one hundred each. Manila cheroots have been analysed by an eminent chemist, and proved to contain no opium—which has been the heinous offence hitherto laid to their charge—and they are clearly of a more refined form than the cigar. The point of the latter is made with considerable trouble, only to be blown off and thrown away. Cheroots would be made of as good a material as are cigars, were there as great a demand for them. The cigar-makers make out three or four hundred daily, and earn from one to two guineas a week. While they work at their desks—in the large establishments, to the number of thirty or forty in a room—one of them, whose work is of course done for him, is often accustomed to read aloud to the rest. The employment of these human rollers is not easy, ladylike one enough, and might be practised instead of potichomania. Every fragment of us is applied to some purpose. Our stalks are made into Scotch snuff, the Irishwoman's 'soft roe' ground up very fine, sifted and scented (or not) with different mixtures. Rappee snuff is our leaf powdered to a fine powder grain—sifted, and wetted, and scented with essences of roses. Roll-tobacco, used for 'plugging,' is made of the richest Virginian, span into different thicknesses, and pressed for months. There are far worse things done with us in some places than those I have been described; there is quite a Borgia system of poisoning administered to the British public, under pretence of

the pipe of peace. I am myself, however, in a respectable house. I am bound round with a spangled ribbon, like those worn by Spanish dancers, in company with ninety-eight of my fellows. The name that I at present enjoy is that of an *Imperial Lopez Regalia*; but to-morrow I may be a *Nicholas*, and the next day an *Omar Pacha*. Tobacco for pipes comes to the consumer, as I have said, with but small profit to the dealer, but the cigar must be paid for—as that cadet of our family, Snuff, would say, ‘through the nose.’

But, alas, alas, I am in the hands of a purchaser; it is well that my story is told; for my existence will be but for a few minutes longer, and then my ashes will be scattered on the winds!

THE FALSE DREAM.

SOME time after Louis XVIII. was restored to the throne of his ancestors, when the last of the emigrants had returned and set themselves up in the dilapidated *hôtels* of Paris and the still more ruinous *châteaux* of the country, with a large display of old crests and titles, and a great diminution of ancient state and style; when the Faubourg St Germain and its adherents firmly believed that the Bourbons were never more to be rooted up, but the régime would go on from one generation of Louises and Charleses to another, always maintaining etiquette and keeping down the people—the entire house of Courtois was thrown into confusion by two young persons, who insisted on getting married.

The house of Courtois belonged to the noblesse of Brittany. It was very numerous and very poor, with the exception of its venerated chief, a marquis of seventy-three, who had come back in the time of the Emperor, recovered all his own estates and part of somebody else's, married in regular succession three handsome dowries, wore crape for the ladies who accompanied them, and was now a widower with no children. The marquis kept fast hold of all that came into his hands, and gave laws to the whole of his kindred. They knew he would die some day; and as most of their prospects depended on his testament, there was not a more absolute monarch in ancient or modern history. They managed their houses, they educated their children, they were married, and, it was said, born according to his commands. The number of the families that existed on the hope of his demise, and obtained consideration from their neighbours and credit from their tradesmen in consequence, may be imagined, from the popular assertion, that there was not a town or village in France destitute of a Courtois. Every one of them enjoyed a pedigree reaching from the first crusade; but, for the sake of ancient blood, it is to be lamented that not only fortune, but nature herself, had behaved in anything but a liberal manner to that noble house. It was a fact not less generally recognised than their numbers, that all the sons were stupid, and all the daughters plain; and the disposal of either was always a difficult business. The disturbing young persons above mentioned were striking exceptions to this family rule. Silvestre had been born at Bordeaux, and Adeline at Avignon. They were both orphans. Their relationship was that of cousins thirteen times removed. The gentleman's estate consisted of a ruinous building, half farmhouse and half *château*, which one of his ancestors had built for a hunting-lodge in Bas Bretagne; but the surrounding domain had diminished to some metres of garden-ground: and the lady's dowry was

old lace bequeathed to her by her grandmother. The whole house of Courtois had, nevertheless, formed high expectations of their future. Silvestre had taken so many honours at college, that his granduncle, who was confessor to one of the Duchess de Berri's maids, promised to get something done for him if he went into the church; and Adeline came from the convent of St Clair such a pretty, graceful girl, that her cousin, the count's widow, who wanted somebody to enliven her large dreary *hôtel* in the Faubourg, and cheer up her very small parties, said she would introduce her to good society. Who knew but the girl might make a brilliant match, and the marquis might give her a dowry?

If there was ever the slightest probability of the latter event, it was rendered null and void by an unlucky meeting at mass in the Madeleine, where Silvestre saw Adeline, and Adeline saw Silvestre. Both remembered that they were relations. An acquaintance and a love-making followed; and then, in spite of all good advices and every manner of warning, the pair would make a match of it. Of course the marquis was consulted by a family deputation, for he lived in strict retirement, at least from his relatives, though his house was never empty of company and cards. His decision was given in the course of a fortnight: that the young unmanageables should be married with all convenient speed, supplied with two cheap suits each, and sent to live at their ancestors' hunting-lodge in Brittany. These orders were carried into immediate execution. The lovers promised to pray for the marquis all their days, and went rejoicing, with the two cheap suits, to lead a life of Arcadian simplicity and unalloyed happiness, under the administration of old Jacquette, who had been Silvestre's nurse, and stewardess of the *château* and garden-ground, ever since he grew too tall for her management.

Their appointed residence was situated in a wild and solitary dell about a league from the village of St Amand. The country round was half marsh and half moorland; it had once been a forest, and in some spots there was still underwood enough for the wolf and wild-cat to bring up their families. The house had been a low square fabric, with four turrets; these were gone, and so was part of the roof. There were just four rooms habitable on the ground-floor, and only two of them furnished, with chattels which Jacquette had inherited from her grandmother; but the arms of Courtois were still discoverable over its moss-grown entrance. There was a tradition that a robber had been hanged there by one of its ancient lords; so the whole country was proud of the place, and called it the *Château St Amand*. St Amand itself was one of the poorest and oldest-fashioned villages in all Brittany. Under the roofs of its timber cottages, the cows and the sheep, the hens and the family, all lived sociably together. They ground corn there with a handmill, and believed that the oxen talked to each other every Christmas-eve. No physician or notary had ever looked for practice there; no government had ever thought it worth while to appoint a *préfet* or postmaster in that village. All its public affairs were managed by Father Martin; he had said mass in St Amand for thirty years, and so many changes of governors had occurred in that time, that the good man could never distinctly make out who had last come back to the Tuileries; but nobody had ever known him to forget a fraction of his own dues. Under such temporal and spiritual direction, a Breton village might do very well without physician or notary, postmaster or *préfet*; but it could never do without a wise woman; and that important office was, by common consent, assigned to the stewardess of the *château*. Nobody knew her age; the more her

it with the red handkerchief which formed her only head-dress. Sun and wind had brought a naturally dark complexion to the identical tint of the russet woollen gown she wore invariably week-days and Sundays. Jacquette's costume was not *raché*, nor her beauty striking; but she was a short, robust, muscular woman, very active, very thrifty, generally good-humoured, and always proud of herself and her mansion. In one of its furnished rooms she had lived with her cow for the last ten years, keeping the other, which contained the flower of her grandmother's legacy, religiously shut up against the coming of the young master; for it was her conviction that, when Silvestre made his fortune, or a great match in Paris, he would retire to his family seat and live like a Courtois. In the meantime, Jacquette looked after her one cow and bit of garden-ground as the only estate she had to manage; and never were cow and garden turned to greater advantage. The good woman was accustomed to boast that she grew the strongest garlic, and made the hardest cheese, in the commune. Certain it was that on the cow and garden she lived, and contrived to save something—how much, no man was permitted to know—and that mystery, as usual, added importance to the subject. But though deeply respected on this account, Jacquette was still more venerated by the villagers for a faculty she had of dreaming. It was asserted even by Father Martin, that no event, public or private, had ever fallen out in the land, without information of its coming being conveyed to her somewhere between the setting and rising of the sun. The number of births, deaths, and marriages she had thus foretold, would have astonished anybody but a Bas Bretagne. The loss of cattle and sheep, the falling of old houses, and the occurrence of thunder-storms, had been made known to her without measure. The young people of St Amand were accustomed to consult her regarding the prosperity of their love-affairs, the old about the probabilities of their harvests; and Father Martin himself held conferences with her in hard winters touching his Christmas dues.

To this gifted woman, her cow, her garden, and her two furnished rooms in that crumbling old house, came the newly married pair. Of all the relations, Jacquette had been most disappointed and indignant at the match, particularly, it was thought, because she had received false information on the subject in some of her dreams, and predicted a charming bride and a surprising dowry for Silvestre. The honest woman scolded them to the whole village till they arrived; then she did her best to make them welcome: opened the state-apartment, turned the cow into an empty one, worked early and late to make things go far enough for three, taught them all she knew of gardening and cow-management, and kept a sharp eye on their conduct, for Jacquette knew they were but foolish young people. Count nor seigneur had resided in that neighbourhood for three hundred years; the villagers had, in consequence, an immense respect for nobility; and, as the young strangers were of the house of Courtois, did not wear sabots, and enjoyed the protection of Jacquette, they were received with uncommon reverence at the church and market of St Amand. It was not a gay life or a very promising one, but Silvestre and Adeline were in those years when prospects are of little account, and in that state of mind which makes people everything to each other. The young man had not been long enough in view of having something done for him, to miss that outlook and all its accompaniments. The girl had seen just sufficient of her cousin's good society to know that it regarded her as a young person brought home from the convent to be disposed of if possible. They had been poor and despised in Paris, it was better to be poor and revered in

Brittany; so they lived contentedly under Jacquette's government, shared her labours and her fare, and repeated to each other all the verses they could remember about the happiness of a quiet country-life, far from the cares of courts and the sins of cities.

Things had proceeded in this fashion for about six months at the château St Amand. By good-luck, no more of its roof had fallen in, nor had the cracks in its walls grown much wider, and there was every probability of its holding out for the rest of that season, as the winter storms were almost over and Easter at hand; yet her cow and two old hens, accustomed as they were to the good woman's eccentricities, must have been astonished one Saturday morning, for Jacquette got up sighing and groaning, as if not only her own days, but those of the château had been numbered. The young people were not permitted to know it, but they could not help seeing that there was something wrong: she groaned over her spinning-wheel, she grieved to her garden spade, she paused in frying an omelet to cross herself devoutly, and admonished them to go and say their prayers. More amazed than edified by these signs of affliction, they naturally began to fear that Jacquette's senses were giving her the slip; but, after mass next day, when they stayed to see the dance on the village-green, the secret was revealed to her Sunday visitor. It has been stated on good authority that there is no such thing in France as a woman without a lover. The stewardess of the château, accordingly, had one: the widow Renée's son, commonly known in the village as Lazy Jules, had paid his respects to her every Sunday evening, through shower and shine, for the last five years, and been hospitably treated to the hard cheese and the strong garlic. For the latter delicacy Lazy Jules had a special preference; but, on this eventful evening, instead of producing the consumables as usual after the first salutations, Jacquette seated herself on the opposite bench, crossed her arms, and gave a deep groan.

'What is the matter?' said Lazy Jules.

'Don't ask me,' said Jacquette; 'I would not tell it for all the world; but I suppose I must to you, Jules. Listen then, but you won't speak of it—no, not to Father Martin himself. I had such a dream on Saturday morning, just before the cock crew. Jules, I can't make it out; but I never had such sorrow in my sleep. I thought that Father Martin had come here early in the morning—though, good man, he never gets up too soon—and brought, oh, such bad news to my young master and mistress. What it was, I cannot remember, nor make out at all; but I woke with the tears in my eyes and the grief in my heart, and I know there is some great evil hanging over them. Maybe, it's my own going home, Jules. I have led a good life and a hard one, and should not care much for myself. Nobody would miss me, I suppose,' and she glanced at Lazy Jules inquiringly. 'But these young people, what would become of them without a caretaker?'

On which grievous consideration, Jacquette began to cry. Lazy Jules assured her she was good for forty years to come, seriously recommended her to trust in Providence, and finding that the cheese and garlic were not forthcoming, he soon after took his leave.

Jules had been for some time contemplating the propriety of breaking off his suit. A suspicion had crossed both him and his mother that Jacquette's savings might not be as considerable as they had been led to imagine; and now that such shadows of coming evil had fallen on her sleep, his resolution was taken, never to be found another Sunday at the château. In the succeeding week, his spare hours—and they were always numerous with that young man—were spent in imparting to the whole neighbourhood

the tale which was not to be communicated even to Father Martin himself; and before the next Sunday, all St Amand were waiting for the château to be blown down or burned, in fulfilment of Jacquette's dream, and were also aware that Lazy Jules had determined to visit there no more. Of course, the state of the public mind at length reached the ears of the wise woman; and what she said on the occasion concerning Jules, his mother, his family, and his ancestors, need not be recorded here, for Jacquette's tongue was none of the smoothest when she had cause of wrath; but the scold was not fairly over till about three weeks after, when she was roused one morning in the early gray by a loud knocking at the outer door. The good woman's heart died within her as Father Martin presented himself; but the priest's countenance was full of joy and triumph.

'Wake up your young master and mistress,' he said, 'for I have brought news they will dance to hear, in spite of all your dreams. The old Marquis of Courtois is dead, and has left all his fortune to them.'

Father Martin never made a joke about money; it was too sacred in his eyes. Jacquette knew that; and scarcely was his tale told, till she was at the bedside of the sleeping pair, vigorously shaking them both, and crying: 'Get up, get up; you'll lie no more in my old grandmother's bed, nor eat garden-herbs; there's silks and satins, horses and carriages for you; you'll go to mass with two footmen behind, and be called my lord and my lady.'

After this rousing, it was some time before the young people could understand that Jacquette's senses had not departed, and that the legacy for which the whole house of Courtois had done suit and service before they were born, was actually their own. The old marquis had died at last, and whether to disappoint all his relations, amiable man, or to enrich the only promising members of the family, he had previously made his will in favour of Silvestre and Adeline, constituting them joint-heirs of all his possessions except the title, which descended to his heir-at-law, a lieutenant in the African Chasseurs, whom the noble marquis had cordially hated. The rage and disgust of his numerous relatives when this testament was made public, may be imagined. They unanimously refused to attend any mass said for the soul of the deceased, and it was debated among the pillars of the house in Paris, whether or not a commission of lunacy should not be had recourse to. Equally high rose the tide of public feeling at St Amand. It was feared that the widow Renée and her son would drown themselves on the first announcement of the event; but they only set off for Upper Bretagne. Jacquette utterly lost her repute for dreaming from that day; nobody would believe in any subsequent revelation she might get in her sleep; but the honest soul thanked God and all the saints; and it was glorious to hear her dilate on the new roof, the four turrets, and the general plastering the château would get when her young master and mistress came back from Paris in full possession of their great fortune, to keep their family coach, and buy up the whole country, with the right of hunting boars and hanging robbers, like their noble ancestors in the good old times.

To Paris her young master and mistress went in pursuit of their legacy. They had left that centre of civilisation under the cloud of a penniless marriage—they returned to it people of mark and consideration, protected by notaries, and envied by all their relations. As the commission of lunacy was not likely to be got, the latter transferred to them the homage they had been so long accustomed to pay the departed marquis. Once established in his hôtel, friends and advisers mul-

those young people so fresh from the country sensible of wants and requisites becoming their new position. What the granduncle and cousin of former days did or proposed to do, history does not inform us; but Silvestre and Adeline were introduced to fashion, to elegance, and to society with the celerity known only to the happy possessors of large fortunes. German barons, Italian counts, and Russian princes came and did them honour. Madame learned the value of diamonds, Monsieur the use of cards. They forgot all the verses about country-life; they did not like to hear Bas Bretagne mentioned, lest the château and Jacquette might come to people's knowledge, and it would have been an unpardonable offence to suppose that they had ever been out of Paris.

These were not the only changes their good-fortune wrought on the young Courtois. At the particular suggestion of their evil genius, the marquis had so made his will that it was impossible to say where their individual rights terminated, or what was the boundary of each legatee. They would not have disputed for mere bank-paper or acres; but there was a latent love of power and command in both characters, which had not been visible in the young man for whom something was to be done: in the girl brought home from the convent, or in the pair who married for love without a sou, and lived and gardenized with Jacquette in the ruined château. Scarcely had the novelty of being in Paris and having money worn off, when questions regarding privileges and proprietorship began to arise. The joint legacy made them separate interests. First came debates, and then quarrels. The husband found out his authority, the wife her munitions of war. Both parties got lawyers and friends. Within a year after their happy accession, they were holding rival state and receptions in the marquis's great house. Adeline was flirting desperately with a Russian prince of the true Tatar type, by way of avenging her wrongs; and Silvestre was paying court to a terribly rouged duchess of sixty-five. There were temporary reconciliations, and still fiercer quarrels. There were family councils, and suits in law-courts; and at length, all Paris talked of the trial of a lady, young and beautiful, rich and nobly born, but accused of poisoning her husband—it was said to frustrate his design of shutting her up in a lunatic asylum.

Jacquette had gardenized and spun, and looked after her cow almost two summers; every evening and morning walking up to the rising ground above the village, in hopes of seeing her young master and mistress return with the family coach and other requisites for putting on the new roof and four turrets. Letters never came or went from St Amand. Jacquette knew no surer method of getting intelligence of her young people than a journey to Paris. It was a long way, and made a sad inroad on her savings; but she reached the great city just in time to hear that Madame Courtois had escaped the guillotine—her sentence being commuted, in consideration of the above-mentioned set-off, to twenty years' imprisonment. Sad of heart, and sorely disappointed, the faithful stewardess returned home. She never told the story to anybody but Father Martin; and in process of time, it seemed to have slipped out of her own mind, for as the roof crumbled away, and the walls grew more crazy, she was accustomed to wonder to the good villagers who looked in upon her and her respected mansion, why the young people did not come back and begin the repairs. Latterly, as revolutions multiplied in the land, and even the Bas Bretons began to talk politics, she was heard to say that things would never be right in France till the château got its new roof and four turrets; but the predictions of her later years had

remembered that a great fortune had come to Jaquette's young master and mistress, in spite of her false dream.

THE MONTH:

SCIENCE AND ARTS.

To say that hot weather has been the chief subject talked about, that it has taken the vivacity out of all other topics, except, perhaps, the noisomeness of the Thames, is to begin with a truism. As usual in extraordinary cases, Mr Glaisher and his brother meteorologists have been trying to find a parallel season, and they have had to go back forty years. Such extreme heat before mid-summer is indeed a rare phenomenon. As a consequence, rains almost tropical in character have fallen. In one of the storms, three inches of rain fell at Birmingham within three hours, and one half of the quantity in twenty minutes. Hence we of the temperate zone have seen somewhat of the effects of great heat and moisture peculiar to the torrid zone.

The functionaries of the British Association have issued a very good-natured circular, to announce the meeting at Leeds for September next—22d to 29th—and to invite many, both Britons and foreigners, to the gathering, assuring them of amusement and comfort, as well as science. They promise a sight of manufactures, of interesting natural scenery, caverns, cascades, and so forth, attractive alike to the geologist and artist. If the invitation had only promised, besides, an entire absence of smoke, it would have been perfect.

With a view to foster their art, the Photographic Society are organising a scheme for the exchange of photographs among their members.—Photography is now brought into play for one of our social usages; and people who make morning-calls, instead of leaving a card with their name, will henceforth leave a card on which their own portrait has been photographed in miniature. Likenesses instead of names; the notion is a good one; but will the select few who indulge in the luxury have a fresh portrait taken every year to insure a faithful likeness?

According to official returns, the quantity of paper charged with duty in this country in 1857 was 187,414,667 pounds, shewing a decrease from the former year. This falling off, it is said, would not have taken place but for the injurious and unfair operation of the paper-duty. Were this duty taken off, we should see a rapid development of ingenuity in the art of paper-making—materials which cannot now be worked up at a profit would then come into use, and many a languishing mill would revive into busy life. The government is not prepared to remove the tax; but the House of Commons have resolved that the duty on paper is 'impolitic,' so we may hope that in the course of next session the obnoxious impost will be repealed.

Mr Carrington of Redhill Observatory has drawn up a set of instructions for the guidance of astronomers who may travel to South America to observe the forthcoming eclipse of the sun. It has been suggested, that while one party observes on the east coast, and another on the west, a third should take observations from one of the elevations of the Andes, between the two.—We hear that the United States government, now that the delusion about 'British outrages' has died away, intend to equip an expedition to follow up the discoveries made by the late Dr Kane within the Arctic Circle.—News from the Niger expedition reports that Dr Baikie was at Rabba in good health and condition.—We have another instance of the intelligence of the New Zealanders in the establishment of the *Port Nicholson Messenger*, a

newspaper printed in the native language for the benefit of the natives. Communications from natives in their own vernacular are frequent; and considering the advances they have made in other ways, we shall not be surprised to hear before long of Maori editors, printers, compositors, and publishers.—At Cape Town, a new building has been erected for a library and museum; which affords satisfactory evidence that money-making does not, as has been said, engross the whole attention of our brethren on the other side of the globe.

In a communication to the Statistical Society on Public Works in India, Colonel Sykes rectifies certain popular misconceptions, and shews that much more has been done than is commonly supposed. Nearly nine thousand miles of road have been made in the Punjab states—the countries on both sides of the Indus—in Hazara—the Peshawar Valley, since 1853. A considerable portion is, of course, roughish in quality; but a rough road is better than none, and improvements are continuous and systematic. The Grand Trunk-road from Calcutta to Delhi, 837 miles, is as good as any turnpike-road in England, and cost L.489,100. The Great Deccan Road from Mirzapoor to Nagpoor is 400 miles in length, and the road from Bombay to Agra, 785 miles. Four steamers and four flats ply on the Ganges, and on the Indus ten of each. A line of what are called steam-trains is to be established on the river, to run between the terminus of the Sind railway at Kotree, and Moulton, the terminus of the Punjab railway, each train to be capable of carrying a thousand men, or a proportionate burden of merchandise. The whole outlay for public works in 1854–55 was L.2,230,000. Irrigation works are in progress; and where these are introduced, the land is fertilised, and the wealth of the empire increased. The Ganges Canal is to yield L.145,000 a year of revenue. The value of water is great in a country where little or no rain falls for eight months of the year; but, as Colonel Sykes observes, it is not all land that will bear a water-rate, and 'it is, moreover, quite a mistake to suppose that the bulk of the population in India lives upon rice, which, from requiring a water-supply, has its cost so much enhanced above that of the plentiful panicums and sorghums: as a general food, the consumption of rice is only general in the low districts of Bengal, Orissa, Madras, and Malabar.'

The carrying out of public works in India is a very different thing from what it is in this country, where all means and appliances are abundant. There the chief engineer must be ready with manual labour as well as mental labour; 'his resources are chiefly in himself, for he must be not only the designer of the work, but the head-mason, the head-carpenter, the head brick and lime-burner; in fact, the man of all detail, and of all general design.'

The Acclimation Society of Paris, having obtained a grant of fifteen hectares of land in the Bois de Boulogne, are about to establish a garden for the better carrying out of their various operations, which are 'to acclimatise, multiply, and distribute animal and vegetable species, either useful or agreeable.' With this resource the Society will be able to accomplish more than heretofore. As we have shewn from time to time, they have already done great things: they have introduced the yak, with its wool, into France; a new species of yam, as a substitute for the potato; potatoes fresh from South America; to renovate the worn-out stocks of Europe; the sweet sorgho, in the culture of which Southern Europe will become a sugar-producing country; the silkworm of the castor-oil plant—*Palma Christi*, and with such success, that the worm is now in its twenty-first brood, and is accustomed to feed on the leaves of the teasel; moreover, by careful management, the hatching

of the eggs is made to time with the growth of the teasel leaves. This is a remarkable result, as the silkworm in question is a native of Algeria, where the warm temperature is earlier than in France. Aided by French missionaries in different parts of the world, the Society have nearly succeeded in propagating the oak-silkworm in the open air, in countries where the climate is dry. And they have recently received plants of the *Loza*, a species of buckthorn, which produces Chinese green, or green indigo, as it is sometimes called; which plants, it is said, will bear the winter of Paris. Other facts might be enumerated; but in these the Society fully demonstrate their claim to consideration.

This Chinese green will become a valuable addition to industrial resources, particularly for dyers. M. Rondot has written a book about it, entitled *Notice du Vert de Chine*, giving a clear history of that remarkable product and its properties. The book contains specimens of calico and silk dyed with the 'green,' and engravings of two plants, *Rhamnus utilis*, and *Rhamnus chlorophorus*, from which it is derived. These plants are new to European cultivators; they are, however, allies of the *Rhamnus theeensis*, which has long been known as a tree from which the poorest class of Chinese pluck the leaves to use as a substitute for tea. The colour of the dyed silk is remarkably bright, a blue green, one of that class of colours which increase in brilliance in the light. It contains, in fact, some immediate principle which can only be developed by light, and it is a nice task for chemists to discover what this is. Persoz says that light will have to be more and more regarded as an industrial agent; and of the Chinese green he remarks that it is *sui generis*, containing neither yellow nor blue. By experiments made at Lyon, it appears that six species of the European *Rhamnus* will yield a green dye: all the others are to be tried.

Natural history has been somewhat popularised of late, and now another contrivance for promoting the study is put forward in the Butterfly Vivarium. Youthful students will doubtless derive as much pleasure and amusement from butterflies and moths as from fishes and water-snails. We have heard, too, of a Bryarium—a glass-case for mosses—a description of which was communicated a short time since by the Rev. H. Higgins to the Linnean Society. He fits the case with shelves, and keeps the plants in pots in proper soil, and waters them when needful by means of a syringe. Some of the pots require to be placed in trays of water. In this way a large collection of mosses may be grown; and a little experience shews which kinds thrive best. Mr Higgins finds some species of *Bryum* very successful, and mentions the *Pseudoselago* as 'gems for cultivation.'

A botanical subject reminds us that a veteran botanist, Mr Robert Brown, died last month, at the age of eighty-five. He was in many respects a remarkable man. As keeper of the Botanical Department in the British Museum, he continued his duties there within a few weeks of his decease, retaining his usual clearness of mind and cautiousness of expression; and his sight was so good that he never wore spectacles. In him we have lost a link with the men of science of the past generation—John Edward Smith, the founder of the Linnean Society, Banks, Solander, Davy, and others.

Mr Sclater has read a paper before the Linnean, in which he attempts to systematise a part of natural history in a way that will interest naturalists. Among the facts which he brings forward, he states that there are in the globe 7500 species of birds, and 6000 square miles of the globe's surface to each species.

The fourth volume of General Sabine's translation of Humboldt's *Cosmos* is published, or rather the first

pages. It treats of the 'organic and inorganic domain;' coming down from the sidereal universe, where we can use only our eye, to the earth, which we can examine and experiment on by our other senses and other means, and in which we are more interested. It sums up what is known of the phenomena of terrestrial magnetism; of the density and ellipticity of the earth; of certain volcanic phenomena of the aurora; and all with the same masterly insight and power of generalisation as in the former volumes.

Apropos of volcanic phenomena, Sir Charles Lyell has read a paper before the Royal Society on lavas and the formation of Etna. His recent visits to Sicily and Naples, and persevering and laborious investigations while on the spot, have led him to conclusions opposed to those of Von Buch and Elie de Beaumont, who hold that volcanic craters are the result of upheaval. Sir Charles attributes them rather to the repeated outpourings of molten material which have built them up, so to speak, on the outside. With this the question is raised, and now geologists of both schools have only to argue it out to a true conclusion. Meanwhile, Vesuvius is pouring out new floods of lava, repeating phenomena which they may witness with their own eyes, and inform themselves by actual operations. Sir C. Lyell expresses surprise that so little should be known of the last eruption of Etna, 1854-55, and so little notice taken of it, considering its magnitude—the greatest for centuries. Where, on his former visit, he had seen verdant glens and forests, now all is obliterated, and for many a league the eye views nothing but ridges of black lava.

Some curious experiments have lately been made, shewing the effects of electricity on thin jets of water. If an electrifier be held near a jet which forms a sheaf-like stream on passing through an orifice, the dispersion ceases, and it becomes a single thread of water; but if the electrifier be brought yet nearer, then the drops are reproduced. Again, hold an electrified stick of sealing-wax at the top of a small column of water, and the cylindrical form will be unbroken; but shift the electrifier to the base, and the brush forms at once at the top of the jet.—Mr Faraday shews that if a ball be placed on a flat metallic plate connected with a Grove's battery, it (the ball) sends off a stream of sparks as soon as the current is established, and runs rapidly around the plate.—De la Rive, in a letter to Mr Faraday, explains a method by which he produces an artificial aurora. Into a glass balloon, he introduces one end of a bar of soft iron, fitted with the necessary connections; he exhausts the air, and sends in a very small quantity of vapour of alcohol, ether, or turpentine, and then making a communication with a Ruhmkorff's coil, he gets an aurora on and around the end of the rod, which throws off luminous coruscations and rotates quickly. The direction of the rotation may be changed at pleasure. But for surprising effects produced by electrical discharges in a vacuum, Mr Gassiot's experiments, shewn before the Royal Society, excel all other. He produces quivering bands of light of surpassing beauty; and to demonstrate what further can be accomplished, he is making glass tubes for the vacuums of dimensions far exceeding any hitherto attempted for the same purpose. Out of all this it is thought we shall arrive at some positive conclusions concerning the phenomena of the aurora, besides other manifestations of electricity.

As regards a useful practical application of electricity, we hear that a manufacturing chemist in France, taking advantage of the sulphates thrown down by a battery in action, has produced 180,000 kilogrammes of 'metallic white,' fit for house-painters, since 1853.

applications: Mitteleldorff of Breslau heats wires to a white heat by means of a battery, and uses them for cauterising interior surfaces, or to cut off tumours. The advantage is said to be great, because the wire can be applied to the part affected before heating, and that the heat, though intense, can be withdrawn as instantaneously as it is produced, and the patient is spared the alarm of seeing a red-hot wire brought near his face, breast, &c.—The *Nuovo Cimento* contains an account of experiments by Count Linati on that interesting subject—the reinvigoration of nervous energy by electricity. He brings a current from a Daniell's battery to bear at the same time on the dorsal and the epigastric regions of his patients for two or three hours at a sitting; and, after several sittings, he finds that the circulation is increased in activity by about one-seventh, with a more energetic pulse; that the respiratory function is augmented in a similar degree, as also that of the stomach and intestines, while the repairing power of assimilation is sensibly facilitated.

A frog poisoned with *curare*, that South American poison, exhibits curious results: the nerve will not contract on the application of electricity—shews, indeed, not the slightest sign of sensibility; but if the muscle is touched with the wires, it contracts strongly, and preserves the contractile power longer than if unpoisoned. Cold has the effect of diminishing the rapidity of a current of electricity through a nerve; a fact from which operators may take a hint. M. Duchenne of Boulogne—on whom a decoration was lately conferred by a decree published in the *Moniteur*—turning these and other conclusions to account, has demonstrated, and with marked success, the therapeutic effects of electricity. He owes much of his success to the means by which he localises his applications. He makes use of three terms in his process—namely, electrification, galvanisation, and Faradisation; the last, which is induced electricity, is the best agent in muscular electrification, especially when required to be long continued, and is, as M. Duchenne avers, the medical electricity *par excellence*. By dint of experiment, he has determined the proper dose for the respective nerves and muscles, an essential consideration, seeing that an overdose involves danger, and the patient might find himself fixed with a contraction, or deformity, greater than that he wished to cure. Some of M. Duchenne's cures are astonishing; by persevering in his electric applications, he has restored paralysed and contracted limbs to their natural condition, inducing the power of voluntary motion; and when that is once achieved, even in a small degree, he leaves it to the will to finish the work. His electric moxa is described as more severe than the actual application of fire.

Mr Gant, of the Royal Free Hospital, has published an inquiry on the *Evil Results of Overfeeding Cattle*, the main point of which is, that meat forced and formed unnaturally is unwholesome; hence disturbance or loss of health in those who eat thereof. Cattle, sheep, and pigs, are now fed up to a size quite disproportionate to their age, or rather to their youth, that prizes may be won at cattle-shows. The heart and lungs are in consequence made to work at high-pressure; these organs thereby become diseased, and with them the whole carcass. Mr Gant tested his conclusions by following the unwieldy creatures from the show to the slaughter-house, by observing what there took place, and by examination of the meat after it was cut up. Among the overfed animals, he mentions the Prince Consort's pigs as distressingly fat and heavy. These evils have been complained of before; but the answer is, that by overfeeding a few, you improve the whole breed of cattle, and so supply the market with better meat. However, seeing that Messrs Lawes and Gilbert have

written a paper on the feeding of cattle, and presented it to the Royal Society, we may hope ere long to be in the possession of sound, practical conclusions on the subject.

M. Gobley has made a careful analysis of milk, to determine anew the constituents of which those slow animals are formed, with a view to ascertain whether they really do contain a cure for thoracic affections. His conclusions negative the belief that the carbonate of lime acts on the tubercle; there is nothing, he says, 'which makes it possible to consider the constituents as exerting any specific action in maladies of the chest.'

PRECEDENCE IN THE FIFTEENTH AND SIXTEENTH CENTURIES.

HAVING given a view of housekeeping three hundred years ago, we readily embrace an opportunity that now presents itself of saying a word on the table observances of the time, as regards precedence. A rare black-letter book, to be found among Bishop More's valuable collection in the Cambridge University Library, and entitled *The Boke of Kerynye* [Carving], W. de Worde, 1506-8, affords us an interesting insight into the table etiquette of our ancestors of the fifteenth and sixteenth centuries. It gives us also an additional proof of the fallacy of the prevalent opinion as to the simple and patriarchal habits of our forefathers of 'the good old times.' In point of fact, society was hampered with absurd conventionalities and cumbersome ceremonials, which only ceased to be in vogue with the reigns of the later Stuarts.

These relics of a quasi-obsolete feudalism, as regards the table arrangements, were still fully practised in the households of Elizabeth and the first James. We read that fully half an hour was occupied, after the table had been laid for the royal repast, in entries and exits of court officials, ushers, marshals, chamberlains, and married and single ladies of honour, who each made a prostration or genuflection in turn on entering or retiring, either to imaginary majesty, which was not then present, or literally to the bread or the salt, &c., as was then, it seems, their duty.

The present article treats of that portion of the *Boke of Kerynye*—a species of servant's manual of the time—which details the duties of the marshal and usher in a nobleman's house, and consequently combines the etiquette of precedence, as it then existed. It even gives us a tabular list of titles, ranks, and offices, which cannot but be found interesting.

Shenstone, a keen observer of the human mind, says, that there are no persons so punctilious as to preservation of rank, as those who have no rank at all, while the querulous assumption of the *parvenu* is proverbial; and when we recollect that nobility in Europe, as an institution, certainly dates no further back than the eleventh century, we can easily account for the tenacity with which the notables of the last at the feudal period held to their aristocratic position, and the importance they assigned to its different phases and gradations.

In our own day, the exclusive order has been well ventilated; but we rather believe that the most incorrigible member of the 'Upper Ten Thousand' would be surprised to hear, that in the fifteenth century a duke might not 'kepe the hall, but sede estatte by thyselfe in chambere or in pavilion'—that is, that he could not eat in the public room, but only in private with his own rank.

There are a few more things fully as interesting in the following extracts:

'The marshall and ye usher must knowe al the

estattes of ye lande, and ye highe estatte of ye kinge with the ye bloude ryall, the estatte of a kinge, of a kinge's son, a prynce, of a duke, of a marques, of an erle, of a bysshop, of a vysscounte, of a beron, of ye three chiefe judges, of a mayer of London, of a knyghte batchelour, of a knyghte, deane, of ye archdeackon, Master of ye Rolles, of ye other judges and ye Barons of Cheker, of ye mayre of Calice [query, Calais], of a doctour devine, of a doctour of bothe ye lawes, of hym that hathe beene mayer of London and sargeaunte of ye lawes. The estatte of a maister of the Chauncerie (and othere worshypfull prechers), and clerkes that be graduable, and al othere order of chast persons and prestes, worshypfull marchauntes and gentlemen—all these last may set at the squiers tabell.'

It must have been something to have had 'esquire' tacked to one's name in those days. However, could the editor of the quaint old *Boke of Kerynges* be brought to life, and could he stop one of our modern postmen, he would be as much astounded as scandalised. But to proceed:

'Marques, erles, bysshops, and vysscountes—all these may set together at a messe.

'And beron, and mayer of London, and three chiefe judges, and ye Spekere of ye parlyment—all these may set, but onlie two or three at a messe.

'And al other estattes may set, or three or foure at a messe.

'Also, ye marshalle must onderstand and knowe well of the bloude royall—for some lorde is of the bloude ryall, and peradventure of smal livelyhood. And some pore knyghte is forsoothe wedded unto a ladye of ryall bloude; but she shall kepe the estatte of lordes bloude, and therefor ye ryall bloude shall have ye reverence as before have I sayde.

'Also, a marshalle must take grete hede of ye byrthe, and next of ye lyne of ye bloude ryall.

'Also, must he take hede of the king his officers—of the chauncelor, steward, chamberlan, tresurere, and comptrouller.

'Also, ye marshalle must take hede onto al straungers, and put them onto worshyppe and reverence, for minde; and if that they do have goode cheare, it is much to your soverayne his honour. Also ye marshalle must take goode hede if that the kinge do sende your soverayne anie message; and if that he sende a knyghte, receive him lyke to a beron; and if that he do sende but a yeoman, see ye receive him lyke a squier; and if he sende but a groome, receive ye him lyke a yeoman.

'Also marke, it is no rebuke even unto a knyghte, that ye set a groome of ye kinge's at his tabell.

'Thus endeth the Boke of Serryce and Carvynges and Servinge, and al mannere of offyces [in his kinde] onto a prynce, or anie otter [other] estatte, and al ye feestes in ye yeares.'

It is amusing to remark, that all throughout this rare old tract, each servant—as in this case the usher or marshal, in our day known as groom of the chambers—invariably styles his employer his 'sovereign.' The master may be a nobleman, however, as this quaint relic of the past sets forth on its title-page that its information is intended 'for the service of a prynce or anie otter estatte.' In those days, dukes, marquises, and earls were called 'princes.' This *brevet* arrangement of titles of nobility was prevalent, indeed, for at least two centuries later; and we find that the profligate Buckingham is addressed, in one of the servile and fulsome dedications of the period, as 'The most High and Puissant Prince, the most Exalted and Noble Duke of Buckingham,' &c.

That portion of the above extracts which speaks of some 'pore knyghte' married to a lady of the 'ryall

faction, violence, or intrigue having disposed of British kings in the very summary way peculiar to our early history, set up new occupants of the throne, whose families, and even distant connections, must have been often surprised to have suddenly found themselves included in the 'ryall blond.' The marshals and ushers of those days would have found such changes particularly perplexing to them occasionally, in the exercise of their somewhat onerous and responsible vocations.

STORY OF A RURAL NATURALIST.

THE following truthful narrative exhibits, we think, a degree of devotion in the pursuit of science under difficulties which has rarely been paralleled.

There lives at present in Banff a journeyman shoemaker named Thomas Edwards. Ever since he can remember, Mr Edwards has had a strong predilection for pursuits connected with natural history; more especially, he has devoted himself to making a collection of the land-animals of the district around Banff, as well as the productions of the neighbouring sea. In making this collection, he was engaged for eleven years. During five particular summers—between 1840 and 1846—when he was from about twenty-five to thirty years of age, Edwards generally passed only part of two nights each week in his own house—namely, from a little before twelve on Saturday night till late on Sunday morning; and again on Sabbath evening till near dawn on Monday morning. But even this latter portion of the night he frequently passed dozing in a chair, or lying across his bed, having previously donned his working-clothes, so as to be prepared to start with the first peep of day. All this time Edwards was working from six in the morning till between eight and nine at night; his wages, with which he maintained a wife and a family of five daughters, being about twelve shillings a week. The other nights of the week, unless a storm prevented him, he spent out of doors in the woods with his gun, or by the sea-shore, or wherever he expected to find what he was in search of; but regularly he was at home for his work by six in the morning.

He used to sleep an hour, or so during the darkest part of the night, wherever he found himself; if the rain was heavy, if possible under a tree, or such-like accommodation; if not, he did without shelter at all. By persevering thus, he made a collection numbering two thousand specimens. These, on certain fair-days, he used to arrange in the town-hall—filling three sides—and expose for a small charge. Sometimes he made a pound or two this way. Unfortunately, he was advised, some years ago, to try an exhibition in Aberdeen. He paid a pound a week as rent for a shop in Union Street, and advertised liberally. The consequences were to him ruinous. In six weeks he was hopelessly in debt. A party of equestrians arrived in the town, and, to use Edwards's own words, 'a few came to him after the performance, and said the birds were nearly as good as the horses'—not so the mass. He commenced by charging sixpence, and ended by admitting visitors for a penny; but all was in vain.

Not having the means to pay the charges he had incurred, he advertised his collection for sale, and, after considerable negotiation, got £20 for it. This sum cleared him of Aberdeen, and brought him back to Banff, a sadder, if not a wiser man. For a while he was sorely discouraged; but, by and by, his old tastes returned, and although pursued now with moderated zeal—for exposure has not strengthened his constitution—Tom has again begun to collect specimens, has been appointed keeper of the local museum, which he has aided in bringing to high

again eagerly employed in illustrating the natural history of Banff.

While still a journeyman shoemaker, he corresponds, on his favourite subject, with several magazines, as the *Naturalist* and the *Zoologist*, and his services are recognised by Mr Spence Bate and Mr C. W. Peach, well known for their zeal in natural history.

RAREY ANTICIPATED.

DR CASAUBON, in his work, entitled *Of Credulity and Incredulity in Things Natural, Civil, and Divine*, printed in the year 1688, speaks of one John Young, a 'horse-courser,' as follows:

'Whilst we were above, in the best room I had, and the servants in the kitchen by the fire; my son—the only I then had, or since have had; some twelve or thirteen years of age—comes in with his mastiff, which he was very fond of, as the mastiff was of him. John Young, to make himself and the company sport: "What will you say, sir," saith he, "if I make your dog, without touching of him, lie down, that he shall not stir?" Or to that effect. My son—for it was a mastiff of great strength and courage, which he was not a little proud of—defied him. He presently to pipe, and the mastiff, at a distance, to reel; which, when the boy saw, astonished and amazed, he began to cry out. But the man, fearing some disturbance in the house, changed his tune, or forbore further piping, I know not which, and the dog suddenly became as well and as vigorous as before. Of this I knew nothing, till the company was gone. Then a maid of the house observing that I much wondered at it, and wished I had seen it—"O master," said she, "do you wonder at it? This man doth it familiarly, and more than that, the fiercest horse or bull that is, if he speak but a word or two in their ears, they become presently tame, so that they may be led with a string; and he doth use to ride them in the sight of all people."'

Dr Casaubon hears also, upon good authority, that 'this man was once in company, and being in the mood, or to that effect, began to brag what he could do to any dog, were he never so great or so fierce. It happened that a tanner, who had a very fierce mastiff, who all the day was kept in chains or musled, was in the company, who presently—not without an oath, perchance, it is too usual; good laws against it, and well executed, would well become a Christian commonwealth—offered to lay with him ten pounds he could not do it to the said dog—that was, without any force or use of hands to lay him flat upon the ground, take him into his arms, and to lay him upon a table. Young happened to be so well furnished at that time, that he presently pulled out of his pocket—I think I was told—ten pounds. The tanner accepts; the money on both sides laid into the hands of some one of the company, and the time set. At which time, to the no small admiration, certainly, of them that had not seen it before, but to the great astonishment, and greater indignation of him that had laid the wager, with a little piping the party did punctually perform what he had undertaken. But instead of the ten pounds he expected, being paid only with oaths and execrations, as a devil, a magician.'

Our author himself never sees any of these wonders performed, but he appears to be well convinced of them, and he is greatly impressed with Mr John Young's own manner, who, 'earnestly looking upon him, begins a discourse, how that all creatures were made by God for the use of man, and to be subject unto him; and that if men did use their power rightly, any man might do what he did.'

COLOUR OF WINE.

The colour of wine is owing to the following causes: If the skins of the grapes, or marc, are entirely excluded from the fermenting vat, a white wine is always obtained, the juice of almost all grapes, black and red, as well as green, being colourless. Champagne is made from a red grape, so deep in colour as to approach to black; and

sherry is made from a mixture of white and coloured grapes. The colour of red wine is derived from permitting the wine to ferment in contact with some of the marc, the colouring matter of the grape residing altogether in the skin, with the exception of the grape called tintilla, from which tint-wine is made, in which the juice is coloured. This colouring principle is soluble in alcohol; therefore, when the alcohol is developed by the fermentative process, the must becomes coloured in consequence of the action of the spirit upon the marc. The wine is also more deeply coloured from a higher degree of pressure given to the husks of the grapes. The colour of red wine varies from a light pink to a deep purple tint, approaching to black; the clarets hold the intermediate rank between these two extremes. Dr Henderson observes that 'on exposing red wine in bottles to the action of the sun's rays, the colouring matter is separated in large flakes without altering the flavour of the wine. The colour derived from the skins of the grapes alone is not generally very deep; the high-coloured wines of France and Portugal are often rendered so by colouring ingredients, particularly by mixture with an intensely deep red wine, called *vino tinto*, and sometimes by elderberries and colouring drugs.'—*Housewife's Reason Why*.

CUCKOO.

THE moon is but a crescent white,
Toward the setting of the sun;
Through the throbbing of the night
Comes a mellow monotone:
Cuckoo!—cuckoo!

You may take a crimson cloud,
Bind it with a golden band,
All its richness were a shroud
To this o'er the meadow-land:
Cuckoo!—cuckoo!

Glory, might, and mystery,
Beauty, wonder, and unrest,
The whole soul of melody,
In a rolling note express:
Cuckoo!—cuckoo!

Gleby fields it overfloats,
Like a tidal wave upbent,
Over wheat and yellow oats,
In the valley falling spent:
Cuckoo!—cuckoo!

It will touch the soul to tears,
List'ning in the falling dew:
All the sadness of the years
Cometh rushing over you:
Cuckoo!—cuckoo!

Things of beauty and delight
You have dreamed of, overjoyed,
Will loom out as though you might
Reach and clasp them through the void:
Cuckoo!—cuckoo!

It will touch from summer woods
Joyous heart or wo-begone;
Melteth music for all moods
From the rapture floating on:
Cuckoo!—cuckoo!

Balmy airs of autumn nights,
Any charm or spell that is,
Windy whispers on the heights
Know no magic like to this:
Cuckoo!—cuckoo!

Sphered notes of starry belts
In its airy net are kuit;
All the heart of nature melts
On the twilight out of it:
Cuckoo!—cuckoo!

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 240.

SATURDAY, AUGUST 7, 1858.

PRICE 1½d.

FEATHERED MINNESINGERS.

THERE are two things for which I have a passion—wild-birds and wild-flowers; by which avowal let me not be understood to mean that I am insensible to the delicious aroma of conservatories, or the gorgeous bloom of parterres; much less that I have any rooted affection for the harpy-eagle, or entertain a special predilection for the serpent-eater. But I fear I must confess that I prefer a harebell to a cactus, and speedwell and forget-me-not to calceolarias; and no rajah lory or scarlet macaw need attempt to make up to me for the little wildlings that, 'whether heard or not,' sing by myriads in the hedgerows, hiding in the scented clumps of the milky hawthorn, or shaking free its ruddy berries from the new-fallen snow. Since the days when I gravely followed sparrows in my pinafore, with a handful of salt, the victim of an infamous nursery fraud relative to a caudal application thereof, I have been a devout bird-worshipper, loving with my whole heart, though perfectly innocent of scientific mysteries. My ornithological conclusions at that time, however, were chiefly derived from the curious antediluvian specimens indigenous to a Noah's Ark, and the sparrow-stalking alluded to took place in one of those small mural enclosures which go in cities by the name of gardens.

The dove was my undoubted favourite, secretly, I believe, owing to its prerogative of olive-branch; and after this, my affections wavered between two chrome-yellow canaries and a very remarkable pure scarlet species—name unknown. There was no robin that at all came up to my preconceived ideas, formed upon the dear old ballad that has immortalised the bonny bird—no modern version, plastered with prosy incident, or hammered out into smooth and polished rhymes, till its pathos and its raciness are lost, but the real lilting lines that are so inexpressibly sweet and touching. Children who have read the original, scoff at *Babes in the Wood* in prose. I suppose I may have been six years old, and the book has long been dust; but do I not remember the thin octavo, precious as an Elzevir, with its limp, shining cover of paly green, and leaves of burnished satin; the clear type, speaking from the glossy page; the soft wood-cuts, infrequent, perhaps, but each one honoured with a separate leaf, and its own excerpted legend, and carefully protected from the ravages of the unwary by a dainty film of pink paper! We are not so prodigal of margin and letter-press now.

The *Death and Burial of Cock Robin*, a legend of a very different stamp, unveiled new marvels of bird-flore, infusing martial ardour by the very abruptness

of its initial question and answer, and the haught apparitions of the audacious criminal, bow and arrow in hand, on the title-page. The catechetical plan of this startling drama is highly original, and the excited spectator is introduced to a wide field of ornithological inquiry, not to mention the edifying episodes of the fish and the beetle, and the rather anomalous introduction of the bull as bell-ringer. How the fish obtained possession of that most terrene-looking dish, used to be to me a serious mystery, rousing painful misgivings as to the individual honesty of the benevolent blood-catcher, and involving deep speculations on the subject of fish-potteries and their possible connection with potted fish. The beetle's undertaking capacities were more admissible; but I always considered the owl's feat of sextonship as the *ne plus ultra* of legerdemain. Why the lark so strenuously insisted on the obsequies taking place by daylight, I never could understand, since she made it a point of honour that she was to carry a torch on the occasion; but I rather contemptuously concluded that she must have been afraid of ghosts, and suffered the matter to drop. Of course, I had not the remotest suspicion of any base, underhand doings between rhyme and reason. But all honour to these good old nursery classics! I would give a whole wagon-load of modern importations for *Jack and the Beanstalk*, *Cinderella*, *Cock Robin*, and the *History of an Apple-pie*—which last, by the way, forms the most admirable system of baby mnemonics, and whose most illogical sequences I now gratefully acknowledge, for they taught me the alphabet.

'One swallow does not make a summer,' says the ancient adage; and yet when we see the beautiful darting creature careering swiftly in the pale April skies, we are apt to ignore the wary old saw, though the hedges are sprouting very timidly, and the morning primroses are still cold with frost, and the hoary dew lies white upon the dead beech-leaves till the sun is hot, and hardly a tree but the larch and the sycamore is green, and the snow-clouds are perhaps hovering ominously upon the sky-line. We cannot, it is true, take up the full burden of the quaint old English song—

Summer is yoomen in,
Loud sing cucku;
Groweth seed, and bloweth mead,
And springeth the weed new;

but there rise to our lips the words of a yet older refrain, that 'the winter is past, and the time of the singing of birds is come.' We must, indeed, make up our minds to wait for the halcyon days when the life of the little lovers is nothing but a gush of song;

when, from dawn to twilight, the ear vainly listens for a break or a lull in the 'fast thick warble;' but even now, many a winged minnesinger is piping music by snatches, and the faithful triad of voices that cheered the long, lonely winter, is already merged in a fuller chorus: the brave sweet robin, the daisy of birds; the little wren, chirping softly by her 'ain firsie,' as she looked out at the drifting snow; and the stormcock, or mousel-thrush, whose cheery whistle was heard among the loud bleak winds that swept howling through the rowan-trees, and stripped the branches of their scarlet fruit.

The robin and the wren are among the sacred birds of England. This is the odd chant current among the peasantry of Warwickshire, who make their children learn it with all reverence:

The robin and the wren
Are God Almighty's cock and hen;
The martin and the swallow
Are God Almighty's bow and arrow.

This feeling with regard to the redbreast is perhaps connected with the pretty legend—one of those harmless and suggestive superstitions which extend to certain of the dumb creation an indirect interest in the higher mysteries of the universe; and which, scattered among the more questionable traditions of the Romish Church, certainly tended to humanise the masses, by bringing all things that had life within the limit of a catholic blessing, and casting over the birds and the flowers the beautiful shadow of Christianity. As in the German myth of the crossbill, a place is claimed for the robin among the Josephs and the Magdalenes, who were not contented with standing 'afar off' the day that the sun was darkened. It is said the fearless little mourner flew straight against the heart that had just been pierced by the soldier's spear, and was bidden to wear his ruddy plumage for ever.

Of course, robin is a favourite with the poets. Thomson draws him tapping at the frosty window, and boldly picking up his morning crumbs; Keats hears him 'whistling from a garden croft,' when the swallows are gathering in the autumn skies; Gray's robin 'builds and warbles' among the church-yard violets; Wordsworth's chases the crimson butterfly; Collins pictures him still at his legendary toll, heaping up moss and flowers in the warm summer evenings; and Cowper, wandering through the silent, leafless woods, hears no sound among the powdery trees except the loosened icicle that drops in the winter noon into the rustling leaves at his feet, and the short, broken song of the robin, perched in a gleam of frosty sunshine among the rimy branches. The affectionate and confiding nature of this little bird wins him a way everywhere. He is capable of strong personal attachment; and one of his most winning attributes is a strange rapport, which he has not seldom evinced towards the sick and the infirm. Wordsworth has a pretty sonnet to a wild redbreast that pecked confidingly from his lips in Rydal woods; and he tells of another which took up his nightly abode in the chamber of one entirely confined to a sick-bed. Roosting there upon a picture-nail, he constituted himself the delegate of the countless warblers from whose songs she was shut out; and his cheery matins broke forth with the returning dawn, sweet and clear as if he was nestled beneath the stars in the whispering greenwood. We knew a robin which displayed a similar instinct, emboldened, it would seem, by the presence of sickness; and which in the fresh summer mornings would enter unbidden at the open window, take his welcome for granted, fly without the smallest fear upon the bed, and take his breakfast under the very eye of the invalid. The robin builds a neat and unpretending nest, rather

brown than green, and generally contrived so as to elude observation. An anecdote is preserved of one who made a little autumn eyry in the shreds of the war-ship which was building at Chatham to commemorate the victory of Trafalgar. The work was suffered to proceed unmolested, and the little patriot actually laid the first of six eggs on the 21st of October, the anniversary of the battle—quite unmoved by the presence of the hundred guns, whose sleeping thunder was destined to waken across the sea the name of England and the memory of Nelson.

But 'the wren, the wren, the king of all birds,' bears off the palm in nest-making. Fabulist as that she alone of the whole feathered race had patience to conclude her studies in architecture; and she certainly presents the most finished specimen of patience and perseverance. The tiny moss-house, roofed over from the rain, appears hardly large enough to accommodate the diminutive owner; yet it affords a cradle to bear a score of wrenlets; and during the leafy summer the wren alone can fill literally the pretty line of the American poet,

The little bird sits at his door in the sun;

so in the darker days, when the infant brood is fed, and the leaves are blown from the shivering bough, the parent bird returns with faithful love to its summer home, and, hidden in its mossy porch, sings out its music, a voiceless minstrel, to the wintry wind.

Nor is the wren without his proper legends. But in Ireland and in Germany, the story goes how he crept unperceived on to the outstretched wings of an eagle, when the birds were flying high for a king; how he was borne aloft by an impetus quite independent of his own volition; and how the statesman politician was thus enabled to outscar his magnificent rival, and had the crown-royal set upon his back by the universal suffrage of the over-reached specter. Paddy, however, has private reasons of his own for paying homage to his little majesty, who is said, during the commotions of one of the civil wars, to have awakened a sleeping sentinel by tapping them with his beak upon an adjacent drum, and by the timely admonition, to have saved a party of royals from impending destruction. The Munster boys still drink to his health and happiness on St Stephen's Day, and think him worthy of being ranked with the geese of the Capitol; and so he is.

But the gem of our British birds is the regalia, or golden-crested wren. This fairy 'kinglet'—as he is sometimes called—is not more than three inches long in his feathers; but this is only the full-dress standard; for those who have studied him in *paris estrados*, aver that his actual longitude is somewhere about an inch. He sits with his tiny queen among the post oaks and alms, like an autumn leaf, or a swallow-tailed butterfly; and bows, with a slender cardage of moss and down, they sling their nest, something a sailor-fashion, from a bough, and bring out a numerous progeny of crested atoms—more like him the birds—to swing in turn upon the swaying boughs, and creep among the sunny leaves.

Lower down, upon the same tree, fixed, perhaps, in some young bough that has sprouted from a low in the elm, or hidden in the brier-rose that is twining round the roots of the oak, is the beautiful nest of the chaffinch. No one who has not seen a sparrow's nest, knows what a bird can do. The delicate cup, covered with lichens, might have been turned on a potter's wheel. It resembles an exquisite bowl of frosted silver, within which lie the fawn-coloured eggs, flecked with irregular purple stains. The chaffinch, like the West Indian humming-bird, makes use of the cobweb in its architecture; for it is with the silken thread of the spider that it stitches the mossy thatch to its flower walls. It commonly shuns the larger forest trees,

and chooses a box, a juniper, or an apple-tree in the garden, a furze-bush or a bramble by the roadside, to shelter the callow nestlings that come blind and helpless from the shell. This bird does not sing in winter, for its voice breaks entirely, and nothing is left of its summer melody but a shrill cry of terror or defiance. Yet it does not leave its familiar haunts; and its well-known form may still be seen, with wings of ashy blue, and a breast paler than the robin's, as it detects with quick and sparkling eye a worm or a barley-corn in the brown stubble-field; or roots out with its azure bill the soft golden heart of the scarlet dog-hip. In Thuringia, that ancient home of the troubadours, the chaffinch is so highly esteemed, that a large price may be obtained for one by those who make merchandise of the 'feathered minnesingers;' but in some of the continental countries, this lovely little bird is the victim of a barbarism so cruel and dastardly as almost to exceed belief. With the avowed purpose of *improving* the wild forest music that it has of nature's gift, its hazel eyes are burned and seared away with red-hot iron, and it is condemned to beat its pretty wings for ever in a wooden cage some few inches square. Here, in its blind and hopeless captivity, it sings, and sings, as if it was mad with joy; its wild glad music bursting in piteous frenzy up the warm sunbeams that creep through the grating of its narrow prison, past the mute, merciful sky, till it rings in the ears of Him who, amid the loud harpings of heaven, hears the young ravens cry; and who, throned among worshipping angels, numbers the sparrows as they fall.

Honourable mention must be made of the goldfinch, the most beautiful of all the *Fringillide*, and called, from the perfect finish of its small but exquisite nest, the 'Arachne of the grove.' This gentle and lady-like bird is extremely sociable in its disposition, ready not only to be at peace with all the world, but even to attach itself to a cage-life with happy docility. It has not the slightest objection to practise under a singing-master, and can soon be taught to echo in its soft flute-like tones the louder strains of a professional wood-lark or canary. But fascinating as the little creature may be in his *civilised* state, go with old Chaucer into the Saxon fairyland; and with feet crushing the glittering dew, seek him out among the broad branches of the hushed, sunshiny trees, the charm, the silence, the freshness of that golden summer morning, which, caught by a sunbeam, lives for ever in that ancient heliograph, *The Floure and the Leafes*:

And as I stode, and cast aside mine eye,
I was ware of the fairist medler tre
That ever yet in all my life I se,
As full of blossomis as it might be;
Therein a goldfinch leping prettily,
Fro bough to bough, and, as him list, he ete
Here and there of buddis and flouris swete.

And at the last the bird began to sing
(When he had eten what he eten wold),
So passing swetely, that, by many fold,
It was more pleassant than I couth devise.

And again, at evening:

The goldfinch, eke, that fro the medler tre
Was fled, for hete, unto the bushis cold,
Unto the lady of the floure gan fle,
And on hir hond he set him, as he wold,
And pleassantly his wingis gan to fold.

The bullfinch, a native of England, but much more common in Germany, is quite as fond of 'buddis and flouris' as the hero of the medlar-tree. He is, moreover, quite as amenable, much more sagacious, and will readily exchange his wild-wood warble for human

ditties, which he learns to whistle with a sweetness and correctness truly astonishing. The little tricks and devices to which he can be trained add to the attractions of the piping bullfinch. He is likewise capable of the most ardent personal attachment, and the most violent hatred, is easily ruled by his affections, and is possessed of a memory wonderfully acute and retentive. The following passages are from the life of a pet bullfinch, now departed, who, if he had been born a Douglas, might have carved upon his scutcheon, 'Tender and true.' He had conceived, from the first, a passionate and instinctive affection for his master, which he evinced on all occasions by the most winning ways, and tokens the most intelligent and unmistakable. A soft whistle from the well-known voice would bring him fluttering to the side of his cage, where he would lay his little velvety head against the brazen wires, rubbing it caressingly on his master's cheek, pecking food from his lips with his bright ebony beak, and sending forth the whole time, from his rosy breast, a low chirrup of deep joy. His rooted antipathy to another member of the family was equally striking; and as there was no ostensible ground for Bully's determined hostility, every endeavour was made to arrive at an understanding; but both emotions stood the test of flattery, cajolement, and coercion. In vain the enemy assumed friendly tactics, made humiliating advances, offered ambrosial sugar, and strove to undermine the citadel of honour by a nefarious system of sapping and mining, and then to take the fortress by storm. 'Unshaken, unseduced, unterrified, his loyalty he kept;' and not only never wavered in his allegiance, but refused to avert, by the most equivocal token, the rising cholera of the foe. At last, during the absence of his owner, by a most unjustifiable travesty of that ancient fraud by which Jacob imposed himself upon his blind father, the little hero was cheated into a momentary acceptance of the hostile advances. Arrayed in stolen raiment, his features hidden by a large green shade—the well-known signal of the beloved presence—the wily masker softly approached his face to the bars; and after enjoying for a few moments the wicked satisfaction of the fond twitter of recognition that was meant for another, suddenly withdrew the visor, and revealed his identity to the deluded little Isaac, who nearly broke his heart upon the spot with wild and bitter rage. But Bully was to have his triumph. It was not till a full month had elapsed that the absentee returned, and then without any previous intimation; so that nothing could possibly have transpired to awaken the expectation of the sagacious little bird. He had betaken himself to bed as usual, at sunset, after the manner of all well-ordered 'foulis,' and was roosting peacefully when the parlour clock chimed ten, with his little black night-cap under his wing. Suddenly the outer bell rang; and roused by the sound, the creature started on his perch, and began to move his head from side to side with an uncertain and attentive gesture, which quickly became impatient and eager. Every moment increased his flutter; his feathers were ruffled, his eyes danced, each motion bespoke expectation. A step sounded at the door; he became more and more excited, and began to cheep and whistle. The little faithful thing was not deceived; and when his anticipations were realised, and his master actually entered the room, he shook his pretty wings, struggled against the bars, and poured forth such a flood of joy and welcome as Blondel rang from his minstrel harp when he found his minnesinger king. Alas for the gallant little hero! Not long after, a hateful cat, ripe for blood and murder, made her way to his defenceless prison; and dashing himself in his wild terror against the wires, her cruel claws choked out his innocent life. It is a pitiful consolation

to add, that his tiny corpse was rescued unprofaned from the clutches of the destroyer.

Let us hasten away from these poor little unfortunates, out into the free blue air, where the sky is filled with the warble of swallows, and God's sunlight flashes on their blue glossy wings; where the swifts wheel onwards and upwards for ever; when the house-swallow caters, open-mouthed, for her young; and the marten hangs with clinging feet to its nest on the face of the sea-cliff, and the bank-swallows creep into their sandy burrows. Surely there was never a captive swallow; for over this beautiful bird there rests an almost universal magic, a feeling of veneration something akin to that which is so magically woven into the *Rimes of the Ancient Mariner*. Nor can we wonder at the innocent superstition that hallows the 'prophet of the year.' All glad instincts are awakened by the reappearance of the little Ariel who is chasing spring for ever round the world, himself the living sapphire that girdles earth with flowers. Only the lightning itself is more rapid than that darting wing, which fascinates the eye by its wonderful grace and velocity, as it wheels its ceaseless and untiring flight from the deep sunrise, when it bathes in the dewy purple which is the home of the morning-star, till the last golden tinge has faded and rippled from the edge of the western sky, and it is sheathed in the trembling silver of night. One of Shelley's most exquisite stanzas to the skylark would apply with even greater felicity to the swallow:

In the golden lightning
Of the sunken sun,
O'er which clouds are brightening,
Thou dost float and run,
Like an embodied joy whose race is just begun.

Has anybody ever seen a Pre-Raphaelite swallow? Would Mr Millais ask this one to sit for its picture in the sun? We hope not. What sort of a hybrid, compound reflecting micro-telescope does he use in drawing his perspectives? But get the little 'winged seraph' for one moment into your hands, and observe how passingly beautiful he is. Stroke the sleek purple of his slender wings, note the soft scarlet of his sobbing throat, feel the warm panting of his snowy breast, meet the quick terror of his pleading eye, and then let the 'musical cherub' away. You will from henceforth be able to form your own conclusions on the pros and cons, the spirit and the letter, to put your own sense, comment, and interpretation on the literal, grammatical, possible, and intrinsic philosophy of at least one old English proverb: 'A bird in the hand is worth two in the bush.'

For house-sparrows, it must be owned, we have no especial favour. They are greedy, and noisy, and impudent—lazy withal, when it serves their purpose. Still, as we have no desire to lay ourselves open to the charge of partiality, we must acknowledge that if the sparrow is a thief, so, if all tales be true, revenge is bound up in the heart of a swallow. We will, however, state the case, without pre-judging either party. It is said that a newly married pair of sparrows, thinking it would be more eligible and economical to occupy a furnished residence than to build one, provided they could sit rent-free, established themselves very comfortably and unconsciously in the last year's nest of a couple of respectable, elderly swallows, which had not yet returned from the continent. The owners, on arriving at home, found their desirable family mansion taken by the intruders; but, apparently satisfied that possession was nine points of the law, they gracefully waived the tenth, and retreated before the reigning power. But while the sparrows were laughing in their sleeves at the discomfiture of the houseless pair, the swallows were laying deep and deadly plans of

vengeance. Days passed on. The little mother cowered down as she brooded over her eggs, and her mate watched with proud importance for the arrival that were to fill his quiver. At last the young birds chipped the shell, and of course there was immediate hunger in the camp. The father of the family departed to procure the initiatory breakfast; and the swallows, I am sorry to say, chose this interesting moment for their coup de main. Flying pell-mell to their desecrated habitation, they gave the poor little mother to understand that the hour and the man had both come, and having the necessary bricklaying apparatus close at hand, they walled her up with her hapless brood as sternly as if they had been monks of the middle ages.

The monks, however, if their own credentials are to be taken for gospel, kept their swallows in better order. The swallows were mild and gentle under its régime of Holy Church. St Francis of Assisi, according to the *Golden Legend*, was quite a bird-man. 'A bird sat singing on a fig-tree by the side of his cell. He called it to him; the bird came upon his hand, and he said to it: "Sing, my sister, and praise the Lord;" and the bird sat singing till he gave it liberty to go away. Going to Venice with his companions, and hearing birds singing in a wood, he proposed to sing the canonical hours, but the monks could not hear themselves for the chattering of the grove, wherefore he entreated the feathered choir to be silent, and they remained so till he gave them liberty to proceed. At another place when he was preaching, he could not be heard for the swallows which were building their nests: he said to them "Sister swallows, it is time for me to speak, as you've said enough, be quiet." And so they went.'

We might go on and on for ever; it would still be a story without an end. We might tell of the gold hedge-sparrow, which sings so sweetly in the first days of spring, when the mornings are still dewy, and a bird's voice rings on the air like a bell. Behold the thorn is green enough to hide its early nest, we might look into the leafless hedge for the blue egg that lies gleaming there like jewels, and not so well, alas! as Alfred's golden bracelets. We might stand by the glossy laurel to listen to the merle's morning hymn, and hear the mavis answer him from its orchard, and the skylark, as she drops into her nest. We might dive into a hollow tree for the eggs of the blue titmouse, that beautiful and mischievous little vixen, who will bite if she is at home, but who is probably creating a panic at the bee-hive, by tapping mysteriously at the door, and eating the bees when they come to see what is the matter. We might pass on to the great dark moor, where the morning mist still hangs like a veil of steam, and hear the great domestic linnets singing by hundreds in the sweet yellow gorse. We might pause in the depths of the forest, to listen to the dim voice of the stock-dove, among the sweet breath of pines, and the rustle of leaves, in the still presence of autumn. We might steal into some grassy dell when the cowbirds are asleep, and watch for the nightingale's midnight hymn.

But before taking leave of our feathered minstrelsy, one word must be given to the pleasant memory of that good troubadour, Walter of the Birdmeadow, whose dying bequest to his fellow-minstrels is the theme of one of those quaint and pretty ballads in which the poet Longfellow evokes Walther von der Vogelweide was a minnesinger from his cradle. He lost his first patron, the son of the Emperor Leopold, in Count de Lion's crusade, and he was but a child of seven; and from that time forward his life was that of a wanderer. He may have learned his songs of the birds; and he has one for a device upon his shield. His lays were generally

of a grave and gentle cast, and his name calls up the shades of birds and flowers. After a pure and peaceful life, he was laid to rest in the cloister of Würzburg Cathedral. In gratitude to the singing-birds, which he always regarded as his teachers, he left in his last will an order that they should be fed daily at noon by the chorister-boys, beneath the tree which shadowed his tomb. A niggardly abbot at last, it would seem, mulcted the pretty pensioners of their dole; the 'Deus istius miserere' has crumbled away with the rest of the monkish epitaph; and the children of the choir no longer know the spot where the voice of the minnesinger sleeps.

But around the vast cathedral,
By sweet echoes multiplied,
Still the birds repeat the legend,
And the name of Vogelweide.

HALF AN HOUR WITH A FIGHTING-MAN.

SOME two months ago, I was walking up and down the Lime Street station at Liverpool, in company with a friend, awaiting the departure of the evening mail, by which we were returning home. As it wanted but a few minutes to the time, we selected a compartment in a second-class carriage; but before we could enter, we had to wait some little time to allow of the egress of two or three of the porters, who were deep in conversation with two passengers already seated, while sundry other porters were clustered round the carriage-door, peeping in with looks of admiring curiosity.

Surely, thought I, we are to have distinguished fellow-passengers. Who can they be? Are they the Siamese ambassadors?—who were then daily expected. There were to have been two of them, one from each of the kings. No; it is second class; it cannot possibly be they. Could it be Spurgeon and one of his deacons 'doing it cheap'? No; hardly likely. So we entered the carriage with doubt and curiosity.

At the further end of the carriage, with his back to the engine, sat a man, whose closely clipped hair, bullet head, and broken nose, plainly told me what his profession was. Facing me, on the opposite side, sat his companion, a person of much more prepossessing appearance and manners. A glance convinced me that they were both prize-fighters.

To say that the first-mentioned individual's head was bullet-shaped, is very much to malign that projectile; for surely no piece of metal shaped as that head was could, by any possibility, be got down a gun-barrel; or even supposing it to be once down, could any known means ever get it up again. No geometrical term with which I am acquainted could possibly convey any idea of that head. It was not a decahedron, and it was not a duodecahedron; and its only claim to the title of an 'oblate spheroid' would arise from the fact of its being flattened at the pole.

My friend glanced at me, and I at him.

They were literally, and figuratively, 'ugly customers'; and I secretly hoped that they would not attempt to 'improve the shining hour' by practising their art upon us. However, I soon found that there was no cause for alarm on this head, for the 'spheroid' was very soon in a slumbering, passive state; and as I am naturally rather partial to eliciting information from peculiar characters, such as one does not meet with in the daily walks of life, I very soon got into conversation with my opposite neighbour, whom, despite his profession, I found to be a very polite, I had almost said gentlemanlike man. He spoke in that peculiar tone of assumption common to most Londoners, and I soon learned that his name was — say, Jones; that he was a prize-fighter; that

he had fought seven prize-battles, and had never yet been beaten; that he held himself liable to be challenged by any man alive, no matter who, or what the amount of the stakes; that, at that moment, he was acting as 'trainer,' or professional tutor, to his companion 'George,' as he called him; that they were just returning from 'George's' first prize-fight, which had come off three days before in the neighbourhood of Liverpool; that his adversary's title to the honours of victory was open to dispute, there being reason to suspect foul-play and bribery, and that it had therefore been decided that the battle should be fought over again.

All this information led on, of course, to further conversation; and on my making some remarks as to 'George's' present personal appearance, he assured me that he was very decent-looking now, compared with what he had been two days previously; for then his head was just double its present size, and that he had brought it down to its present dimensions by the copious external application of castor-oil, and that in a few days' time he would look quite respectable.

I thought to myself that his ideas of respectability must certainly differ very much from my own; for, as I glanced at the physiognomy in question, I was much inclined to doubt whether all the castor-oil in creation, let it be ever so 'cold drawn,' could possibly impress the stamp of respectability upon it. But as I considered that tastes differ, and that it was not for me to set up my own as a standard, I did not dispute his statement, but led him on to further conversation.

He informed me that in early life he had been a carter or drayman in London, and that he had never but once come into collision with the municipal authorities, and that occurred when he was pursuing the comparatively peaceful calling before named. It appears that he had a *difficulty*, as brother Jonathan would express it, with a turnpike-man, relative to an alleged act of extortion on the part of the latter.

In writing the biography of all great men, it is customary to relate anecdotes of their early life, to serve as a foreshadowing of what their future developments were expected to be. So in the case in question, the latent fire of that genius which in after years was to shine forth so brilliantly, flashed out gloriously on this occasion. In his own expressive language, 'he jumped off his cart, squared at the man, and gave him one for his knob.'

He was about to resume his seat, with the pleasing consciousness of having resisted oppression, and done his duty like an Englishman, when he was suddenly seized by two myrmidons of the law, was brought up on a charge of assault and battery, for which he got certain days in durance vile, and then returned to the bosom of that society he was afterwards so much to adorn—a wiser and a sadder man.

This appears to have been the turning-point in his life: disgusted with commercial pursuits, for which he felt that he was in no way adapted, he entered into his present profession, which he appeared to have followed with that success which invariably attends perseverance and assiduity.

His conversation and remarks being of a somewhat desultory nature, I found great difficulty in getting at anything like a consecutive account of his life; but from his various remarks, I gathered that he had worked very hard at his profession.

His first introduction to his companion, George, struck me as having some claims to the credit of originality, to say the very least of it. He said that George was brought to his house by a mutual friend, with a request that he (Jones) would take him in hand. 'I rather liked his looks, so I up with my fist and hit him a blow on his nose; upon this, George began to "to shew fight" in good style; so, seeing

him to be "gamey," I undertook to train him, and make the best I could of him.

On my making some remarks about George, and what his future prospects were, he replied that he could hardly make up his mind as to how he would be likely to turn out. Tapping his own forehead, he remarked that 'George was rather soft there'—'that he had no head,' and that a fighting-man should have a 'good head,' so as to know when to take a 'liberty'—that the success of a fight often depended as much upon the head as the *fists*; and that though George was the 'gameyist' fellow going, he was fearful that want of head, and fondness for drink, would prevent his rising to the dazzling height attained by some others of his profession.

For himself, he furnished a strong argument in favour of teetotalism, by saying that although he kept a public-house in London, he never drank anything when going through the fatiguing operation of training, and very little upon any other occasion, except now and then when on an out of the present kind; and he instanced it as a proof of the great goodness of their Liverpool friends, that he had been kept in a state of partial inebriation for nearly six days without its costing him a penny.

This was their first visit to Liverpool, and he expressed himself much pleased with the kindness they had received, and likewise with the general urbanity of the police authorities in that town, who had never once molested them during the engagement.

I asked him whether men in their profession ever saved money. He replied that it was quite impossible. When a man had been fortunate, he was made a good deal of by his companions, who kept him in a constant whirl of drunken excitement until his money was all gone, and then he had to get up another fight to make more; while if he was beaten, the whole of the expenses fell upon him, besides the lost stakes, and then he got into debt; and he advised me—parenthetically and in confidence—never to make a match for so low a sum as L.25, as it could not possibly pay, for the trade expenses alone amounted to over L.30; the principal items of which he enumerated, one of them, I remember, consisting of a 'trainer at L.3 a week and his keep, for seven weeks at least.' Only fancy letting one's self out to be punched and hammered at by a prize-fighter day by day for seven long weeks! For the trainer's office consists of a series of daily encounters with the trainee, so that he may be in good practice when he comes before the public.

He intimated to me that, however much I might be fascinated by the outward show and glitter of their kind of life, it was in reality a very hard one, at least until a man had obtained a *position*; and that nothing but the excitement of popular applause, and having a public reputation to keep unsullied, could possibly carry them through it.

I have often remarked, in all public professions, the great amount of brotherly feeling that pervades the whole body. See with what generosity and willingness authors, actors, and musicians come forward to the aid of a needy brother—by benefits at theatres, by public readings, by concerts, and similar means. And the same feeling extends, strange as it may seem, even to the profession in question, as the following instance will shew; and in spite of the horrid and revolting circumstances attending the affair, it yet shines like a streak of sunlight through the awful moral darkness—a proof to my mind that, let a man debase and brutalise himself to the lowest possible point, he cannot entirely eradicate his manhood; that now and then it will flash up and reclaim its lost throne, let the reign be ever so short.

My companion casually inquired whether I was acquainted with Ede. I replied that I had not that

pleasure, and, moreover, that I was never at a prize-fight in my life. At first, he seemed not disposed to believe me; but on my assuring him that such was really the case, he looked at me more in pity than in anger, but still seemed hardly able to conceive how in this enlightened nineteenth century any one could possibly have gone so far on life's journey as I had without having at least heard of the hero in question. He therefore endeavoured to recall him to my mind by enumerating some of his more celebrated acts of personal prowess. 'You surely must remember Ede, he who killed "Jack" Somebody in his last fight.'

'Killed his man!' I replied with horror.

'Yes,' he said, 'it was a bad job, poor fellow;' and then he told me all about how the man received a hit on the jaw *after four hours' fighting*; how he was carried off the field; how he never spoke a word after the fatal blow; and how by six next morning he was dead.

'But how about his poor wife and children?' said I.

'Ah, poor woman!' he replied, 'it was a bad job; but we all did the best we could for her. We got her up a benefit, and managed to raise about three hundred pounds, which put her into a good public-house; and we all do our best to make it pay. But what,' he added, 'is all that, compared with the loss of such a husband as she had? For my part, I would not lose my wife for three millions of pounds. She is everything to me; and I have my old mother to keep, and I have brought up my two little brothers without its costing anybody else a penny;' and then he went on to say that there was nothing like civility and kindness—it cost but little, and he had always found that they made him friends wherever he went.

Bravo! thought I; there is a green spot yet left even in this rough debased heart—one little thread yet remaining to connect it with human nature. Imagine for a moment that son tending his aged mother, a mother to whom, perhaps, he owed no debt for early lessons of love and kindness; of whom, in the recollections of his early days, he can recall few pleasing memories, few early admonitions from her lips, which might have stood him in good stead through life as his counsellor and guide.

Even the poor brutalised George, who all this time had been dozing away in a state of battered stupidity—even he had some one who loved him, and whom he loved in return.

Of Nero it was said, that over his tomb some loving hand was seen each day to drop a flower; a poor George found it impossible to keep away from a girl in London whom he loved, and who felt lonely without him, although he had to return to Liverpool in a few days to have another mauling, for his friends were going to get him up another fight for his own peculiar benefit, to reimburse him for sundry losses sustained during his last engagement.

And so I drew near home; and on leaving the train, my companion shook me warmly by the hand, and expressed a hope that when I next came to London I would give him a call.

So he went on his way, and I on mine; and as I walked, I thought; and the more I thought, the more I became confused. Wrong seemed to be getting right, and right seemed to have no merit attachable to it. My conscience told me that I ought to hold that man and his profession in utter and supreme abhorrence; but when I thought of the little streaks of sunlight which ever and anon broke through that dark and heavy cloud, I was fain, though still condemning all fighting on general grounds, to soothe certain angry feelings, and to take shelter under the Master's lesson, 'that if I was without sin, I might then cast the stone.' And I asked myself a question

which I could not answer—why am not *I* the fighter, and he in my place, wrapping himself up in his pharisaical cloak of spiritual pride, and thanking Heaven that he is not such as I? Who can answer me that? No, I do not feel quite comfortable in sitting in judgment on this unfortunate person, as I must consider him to be, without first ascertaining whether the five talents committed to my care, with a clearer knowledge as to their uses, have been made to produce other five also? If it has turned out that I have learned a lesson in charity, my half-hour's ride was not in vain.

PEPSIN.

WHEN food first enters the stomach, it is not, as our readers know, in a condition to be absorbed at once into the blood, for the purpose of renovating the effete tissues of the system. It must first undergo the process of digestion, so as to be reduced to a soluble state, or, generally speaking, to such a condition as to be capable of absorption and assimilation. The digestibility of various kinds of food, and the exact character of the digestive process, have been tested in various ways. Schultz experimented on dogs and cats, which he killed at successive stages of the process; Beaumont on a patient whose stomach had, by a gunshot wound, been made tolerably accessible to observation; and Giese—who possessed the strange power of vomiting at will, and was so enabled to recover portions of food which had been for a time exposed to the action of the gastric fluid—experimented on himself. The results of these various attempts to elucidate the digestive process were in many points conflicting; and but little less satisfactory, so far as concerned the comparative digestibility of different alimentary substances, were the phenomena which resulted from the dissolution of food in fistulæ by artificial means. The *modus operandi* alone was established with any accuracy. Under the generic name of catalysis, chemists are accustomed to group those mysterious processes in which a substance is converted into what they call an isomeric variety of itself by means of some other body or bodies which are in themselves incapable of being affected by the operation. Of these processes, that of digestion proved to be one. It was found that, by the action of the gastric fluid, the food is converted into a substance chemically identical with the original body, but, nevertheless, possessing very distinct and peculiar properties; and that the gastric fluid is a combination of a substance called pepsin, or the *cooking* principle, with an acid which is now generally supposed to be that which, under the name of lactic acid, gives to sour milk its pungent and peculiar flavour. It may be that other acids, such as acetic, phosphoric, and hydrochloric, are also present in smaller quantities; but on this point the greatest chemists are still at variance.

Whether pepsin is secreted in a neutral state, and generates the acid by acting as a ferment on the amylaceous substances of the food, or whether the acid is a primary constituent of the active natural juice, is also still disputed. The prevalent opinion would seem to be that pepsin is a neutral secretion. It certainly possesses the inherent property of causing fermentation, although, without the acid, it has no digestive power. The question altogether is an important one; for, if it be a neutral secretion, the part played by the saliva in the whole machinery of digestion assumes additional importance, as we must then conclude that one of its constituents—*diastase*—is employed in the stomach to convert the starchy matter of the food into grape-sugar, which is in its turn 'converted by the pepsin into lactic acid, without

the aid of which pepsin could not perform its natural functions.'*

In any view, pepsin must be regarded as the chief and indispensable element in producing the change necessary to the absorption and assimilation of food. Without it, all the rest are powerless; and hence the importance which its recent introduction upon a large scale into medical practice by Drs Corvisart of Paris, and Ballard of London, has acquired for it as a curative agent in cases of dyspepsy.

Dr Landerer of Athens is said to have been the first who employed artificial gastric juice in medical practice. This juice he is understood to have eliminated from the stomach of a wolf; but even as early as the year 1884 it had been discovered that the gastric secretion retained its power if removed from the body shortly after a meal; while the rennet, or fourth stomach of the ruminants, had even been used in cases similar to those treated by Dr Landerer to replace and represent the natural peptic principle.

The quantity of pepsin contained in the gastric juice was about the same time discovered by Eberle to be in the proportion of 1·25 to 97 parts of water, and nearly 1·75 parts of salts; and by Schwann, to be capable of precipitation only from the fluid contained in the glandular structure of the stomach. The method of preparing it adopted by M. Boudault, the distinguished Parisian pharmacist, as stated in his Report to the Imperial Academy of Medicine, is as follows: From a number of rennet-bags, turned outside in, and carefully washed, the mucous membrane, which contains the secretory vessels, is scraped off, and, after being reduced to pulp, is steeped for twelve hours in cold distilled water. A small quantity of acetate, or sugar, of lead is then added, which precipitates the pepsin. This precipitate, after being in its turn treated with sulphuretted hydrogen, which separates the lead as a sulphuret, is filtered, and left to evaporate either to a sirup or a powder, as may be wished. Care, however, must be taken that the degree of heat to which it is exposed during the evaporating process shall not exceed 120° of Fahrenheit, as, if suffered to evaporate under a higher temperature, the pepsin loses its digestive properties. It has also been found that, from its excessive deliquescence, exposure to the air tends to its speedy decomposition whether as a powder or a sirup: its smell becomes very offensive, and its taste extremely nauseous. M. Boudault, therefore, mixes the sirup with starch, so that the mixture, on being carefully dried, forms a gray powder resembling coarse wheaten flour. It can thus, when required for use, be brought, by the addition of starch or pepsin, as the case may be, to a uniform standard of strength, and may, if necessary, be mixed with equal ease with muriate of morphia, salts of iron, strychnia, or other chemical reagents which do not affect its digestive properties.

The pleasantest way, perhaps, of administering the preparation, is either in water or between two slices of bread; but, taken in any way, it has been found, in a great majority of cases, to cope successfully with the most serious derangements of the gastric organs, not only by its immediate action on the food, but by restoring to the organs themselves their lost activity.

Dr Ballard, in his book on *Artificial Digestion*, notes one case among many which would seem to preclude all notion of the cure being attributable to fortuitous causes. We quote it as we find it abridged in the same number of the *Saturday Review*, to which we have already referred. A lady, sixty-four years of age, had, during four years, 'suffered pain, which she

* *Saturday Review*, No. 74, p. 280. To the article here quoted we are indebted for much that may be deemed valuable in the present paper. But the reader may be referred for further information to Dr Ballard's *Artificial Digestion* and the *British and Foreign Medico-Chirurgical Review* for 1887, *passim*.

had "no words to describe," for three or four hours after every meal. The natural consequences were excessive prostration and complete disgust for food; and she had for many weeks limited herself to four rusks and a little milk and beef-tea per diem. The first day pepsin was used, she ate with ease and enjoyment a mutton chop, although, on the day before, she had endured intense agony for no less than five hours after her ordinary meal. In a few days, she ate pretty freely, and gradually improved, and at length was able to give up the pepsin entirely, to eat without pain, and walk some miles without fatigue.

Now, when we consider how common a disease dyspepsia is, and how immense, in spite of the systematic opposition from many quarters to everything like a rational interpretation of the connection between physical and moral phenomena, the influence of the physical condition on the mental condition is—producing suicides in cases where, with a different state of health, only depression or grief would have followed—the importance of such a discovery as that of Drs Landerer and Corvisart cannot be over-estimated. In comparison with unhealthy secretions in confluence with untoward circumstances, all other causes, except insanity—disgust of life, poverty, thwarted love, shame, remorse, grief, the agonies of despair and jealousy—exercise but a very small suicidal influence. Nor, when it is considered that the juices which flow into the intestinal canal during the twenty-four hours amount to about one-seventh of a man's whole weight, need our readers wonder at the statement. A man weighing ten stones will secrete during that time about three pounds seven ounces of saliva, which shall contain about half an ounce of solid matter; of bile, he will secrete as much; of gastric juice, which shall contain about six ounces and a half of solid matter, he will secrete thirteen pounds; of pancreatic juice, seven ounces; and nearly the same quantity of intestinal juice. With these facts before us, can it be doubted that the physician might often avert a catastrophe against which the moralist would preach in vain?

A WIFE BY ADVERTISEMENT:

A STORY OF 1754.

Mr grandfather was appointed rector of a little village in Nottinghamshire in the year 1758. I am myself an old man, having memories of more or less importance attached to every year of this century; and I could box, wrestle, play cricket, and had even made speeches against the Jacobins, before eighteen hundred was born or thought of.

A clergyman's life was not quite so strict a matter a hundred years ago as it is to-day. The priests neither cared to rule themselves by so high a standard as our modern clergy do, nor was it expected of them by their flocks. Mr Hume's *Essays* had a great influence among those younger clergy who thought, and the customs and laws of 'the town,' among those who did not think. Though this was an evil of a tremendous kind, there was one benefit in it which we are apt now-a-days to overlook—the clergy had more sympathy with those persons who would not come immediately under their influence than they have under the present system. It is thought very shocking now for a priest to be seen in the theatre, and scarcely less so at the opera-house; while, if he were to visit Cremorne or Rosherville Gardens, or Highbury Barn, it is most likely his congregation would take such offence that they would move away in a flock as multitudinous and final as a migration of swallows. But in my grandfather's time, priests and actors were found in daily communion; indeed, such men as

Bishop Warburton and David Garrick were friends; even Mr Whitfield desired his people to go to the comical Ned Shuter's benefit, as that celebrated actor was a 'gracious soul';* and the sons of other clergymen than Dr Primrose went upon the stage as a means of livelihood; while every country man who came up to town made a point of seeing Mr Mossop and Mr Garrick in Shakespeare's plays, and of visiting Vauxhall and Ranelagh.

Just such a time of visiting London had come to my grandfather in the spring of 1758. He was then in the twenty-fifth year of his age, and resolved to enjoy himself for a time on the strength of his recent presentation. He had never been in town before; the nearest approach he had made to metropolitan pleasures were such as his restricted allowance had afforded him during his studentship at Cambridge. Hence it was he was resolved not merely to have a dip, but a thorough plunge, into the amusements of London.

Accordingly, he went to Drury Lane, and saw Mr Mossop in *Hamlet*, and Mr Garrick in a whole series of characters. He saw Mr Barry in *Richard III* at Covent Garden. He was present when Mr Garrick and Mrs Clive appeared in the new play of *The Upholster, or what News?* and saw the quidnunc of the day ruining himself by trembling for the ruin of the nation. He was at Mr Shuter's benefit in the *Bold Stroke for a Wife*, which had not been acted for so long. He went to the entertainment at Marybone Gardens, and the wire-rope dancing, and concert in the Jew's-harp at Sadler's Wells. He drank the waters with the greatest company at Islington Spa. He heard Handel's *Acis and Galatea* at Ranelagh, visited the Camel and Dromedary, saw the moving figure of the great king of Prussia, and every other rarity with which the town was amusing itself.

There was one thing which was a matter of perpetual unrest to my grandfather; namely, that he was unmarried. He had those manners which are pleasant to ladies, or, as it would have been expressed in his day, to the sex; he was well made in look, and somewhat handsome in feature; of a very affable disposition; not given to drinking, gaming, or attending the cockpit; only a little partial to the race, ready always either for cards or for dancing, indeed, the sort of young gentleman ladies were supposed to like. Yet he could find no lady answering to that standard his eyes and his heart set up. He valued for one of a gay and pleasant disposition, yet free from those vices which the ladies of the plays, novels, essays, and memoirs of the age possessed and exhibited sadly—one, in fact, who did not make the town her rule of life; who would find more delight in the society of a loving husband than in the meeting-place of the beaux; who yet would pay some attention to fashion and to personal graces; who would be agreeable, if not a beauty; last, and I fancy far from last, he wished her to have some nice little sum at her own disposal. All this we have seen set down in private records which the old gentleman has left us. Indeed, my mother has told me that she believed he once worked up these requisitions into an advertisement, and inserted them in the *Public Advertiser*. If so, it brought him no wife, although, through the medium of another advertisement, he became acquainted with that estimable lady to whom is due the second degree I owe my existence. Advertisements for wives, and even for husbands, was not unusual a century ago, as every one who has had occasion to search newspapers of that date well knows. A very odd and pleasant collection might be formed from their columns.

Like many other young gentlemen of the period

* Though only for once. See Lockington's *Mem.*

who came up from the provinces to spend a little time and money in London, my grandfather the rector thought it not improbable that in so plentifully stocked a society, he might perchance run across a wife. The wish was entered in his diary the night before he started. Now the custom is reversed. Our city-clerk, with the air and talk of a capitalist, and the costume of a beau, rushes into the country at Easter, Whitsuntide, or Christmas; finds his way into the simple susceptible heart of a country maiden, woos her, adds visit to visit, and condescends to wed her; for she believes it a condescension, until the slow process of marriage-troubles reveals to her the painful sight and sense of her own superiority. Gentlemen were bolder in my grandfather's days than they are in mine; and ladies also. If either saw a person of opposite sex at church, at the theatre, Ranelagh, or elsewhere, they very often made signal of admiration or invitation too plain to be doubted. This was indeed one of the things which aided young men of property and title in their frightful 'affairs of gallantry,' and is the pivot and turning-point in all the memoirs, comedies, novels, and magazine-stories of that time.

One evening, in the summer of 1758, my grandfather betook himself to Vauxhall. He had seen very many young demoiselles during his stay in town; but he had as yet received no wound which the spear of Telephus alone could heal. He had been also to Vauxhall two or three evenings previously, and had glanced and ogled with all the earnestness and pertinacity of an unengaged man; but this fateful evening put a close to all these wanderings and uncertainties. While he was looking backwards and forwards with his customary inquisitiveness, a young lady entered between two gentlemen, who suddenly drew his roving eyes to herself, and unwittingly kept them fixed there during the whole performance. Before he looked for it, my poor grandfather was overcome.

As soon as the songs were over, he followed her from the orchestra to the banqueting-room, and through the long leafy colonnades, with their myriads of little lamps. He stopped when she stopped. When the company were rushing to see the water-works, he kept close to her; and every time she looked at him—and she did so frequently, by choice or chance—he assumed a most serious, speaking, and melancholy countenance.

It was a great sorrow to him when he saw the young lady take her departure, and marked her into her coach. However, he resolved to assure himself of her dwelling-place, and began to picture himself asking the consent of a father or a guardian, or opposing a rival, wealthier and more favoured than himself. He jumped into a coach, and bade the driver follow that in which the young lady had seated herself. But he was not to succeed so easily. The night was foggy when they started; it gradually grew denser; and before they had reached Westminster, my grandfather's coachman turned round and called out that he had quite lost sight of the chase. So he was ordered by my hurt and disconsolate relative to drive to the coffee-house at which he was staying.

This was by no means the first young lady whose bright eyes had stricken my grandfather in public places. Other young ladies he forgot, after a good supper, or at the sight of a fresh face, or at the thought how impossible it would be to know them, or by consideration of the difference there is between looking a beauty and being good. But he could not forget the maiden of Vauxhall. He lost his appetite, not only for town delicacies, but also for town amusements. At last, after three days of suffering, during which, it must be confessed, he neither wished nor tried to heal himself, he sought consolation, and kept

hope from starving, by inserting the following in the *Public Advertiser*:

'A young lady who was at Vauxhall last Tuesday night, in company with two elderly gentlemen, could not but observe a young clergyman, who, being near her at the orchestra during the performance, and especially at the last song, gazed upon her with the utmost attention. He earnestly hopes, if unmarried, she will favour him with a line, directed to V. V., at the bar of the Temple-exchange Coffee-house, to inform him whether fortune, family, character, and profession, may not entitle him, upon further knowledge, to hope an interest in her heart. He begs she will pardon the method he has taken to let her know the situation of his mind, as, being a stranger, he despaired of doing it in any other way, or even of seeing her more. As his views are founded on the most honourable principles, he presumes to hope the occasion will justify, if she generously breaks through this trifling formality of the sex, rather than, by a cruel silence, render unhappy one who must ever expect to continue so, if debarred from a nearer acquaintance with her, in whose power alone it is to complete his felicity.'

Unluckily, this advertisement was either not seen by the young lady, or, if seen, the young gentleman had been unnoticed, or, if noticed, she had not found in herself any corresponding desire towards him. My grandfather was so solemnised by this sudden love, and the hopeless issue of it, that he could find no pleasure in theatres, gardens, or routs, and actually sought his excitement for the next fortnight in attending daily prayers at the Abbey, the Temple Church, St Andrew's on Holborn Hill, or St Paul's. After that time, he began to reason with himself that she might go often to the places whither the town resorted, and that another chance meeting at the theatres, or at Ranelagh, if not very likely, was still not quite impossible. This was the last straw in sight of his rapidly sinking hope.

Accordingly he went; at first, blind and dumb, to whatever was played or sung before him, unmoved alike by Garrick and Mrs Clive in the merriest farces, and by the compositions of Handel and Dr Arne; but, by degrees, these reinterested him; next, he glanced at the bright faces with their mighty caprioles, their 'post-chaise and horses, chair and chairmen' on their heads, in the boxes; he began to find himself curable; and he returned to Nottinghamshire, though a slightly altered, still a very merry man; he amused himself reading, on his road, the two new volumes of *Tristram Shandy* by his brother in orders, the Rev. Laurence Sterne.

My grandfather had been absent from his cure exactly two months, during which time his very light and easy duties were taken by an unbeneficed friend, a schoolmaster in Nottingham, and man of high repute at Cambridge. These consisted in riding over on Sunday morning, putting on a clerical wig kept in the sacristy, and a surplice much more like a smock-frock than that habitually recognised by ecclesiologists as the officiating costume of an English priest, and reading a sermon of Dr Sherlock's on the evidences of Christianity, to a few old women, a dozen framework knitters, and a number of children, who, as they perceived neither the drift nor the need of it, thought it mightily learned. Pastoral visitation was an exercise my grandfather, at this polite period of his life, conceived quite unnecessary; and frequent non-residence was not only not a sin, but a laudable and gentlemanlike habit in the town season; and, if funds permitted, in the Bath and Matlock season also.

To these not onerous duties my grandfather returned with a heart almost whole. There was just a scratch in that organ—I can scarcely call it a

wound—which gave him a little smart at eve and in solitude, in all such idle times and conditions as court memory. To get rid of this he made twilight lively by inviting an old college friend, a county captain, or one of the pupils of the Nottingham tutor, to stay with him; and, when no visitor was to be had, by smoking his pipe at the Lord Ligonier Arms. He also added to his light clerical tasks the heavier avocation of an angler; and often, when his parishioners were taking their dogs rattling along the Trent-side on summer-evenings, they came upon their solitary priest with his fishing-rod, who, although he looked upon apostolical succession in that sense in which the non-jurors and the Romanists held it, as quite beneath the notice of a man of taste and ton, very frequently found himself their successor in the piscatorial art of tolling all day and catching nothing.

Just at this time some leading political persons in the county were using great efforts to start a new church and anti-gallican newspaper for the midland district—I forget its name. Like so many of modern date, it was just got to move, strutted a little way, bragg'd of its power and vitality, and suddenly dropped down dead. The promoters mainly depended on the support of the squirearchy and clergy; letters were addressed to all these persons; amongst others, consequently, to my grandfather. He was delighted—it came to him in the light of that deliverance from *ennui* which he had long been looking for. He not only promised to use his utmost efforts to further its circulation amongst his clerical brethren, but also volunteered his services as contributor.

I have in my possession a book of printed slips from this newspaper, being the entire series of my grandfather's contributions to it. They consist mainly of panegyrics on Frederick the Great, at that time the most popular man in England. These are a specimen of their titles: A Sketch of the Life of that Grand Character who is the Hope of Europe (the king of Prussia); the Protestant Hero (the king of Prussia); an Essay on the Literary Labours of the Great Philosophical Monarch (the king of Prussia); the Scourge of Superstition: an Ode to the King of Prussia; Tribulator Gallus: an Ode to the Great Frederick; Caesar Outdone, or a History of the Battles of our Magnanimous Ally (the king of Prussia).

To these are appended a series of papers, some in print, and some only in manuscript, imagined by my well-meaning grandfather to be in the style of the *Tatler* and *Spectator*; but they are not of that use for the illustration of the middle of the eighteenth century which those inimitable papers are for that of its commencement, or I should either have published them, or presented them to our national library at the Museum.

Every Thursday morning, if my grandfather had not started very much earlier to fetch it, a lad came over from the printer's at Nottingham with this paper. In February 1750, the twentieth week after its birth, and seventh before its death, the boy brought the small quarto, as the young rector was dressing himself for a day's shooting in Lord Byron's park at Newstead, the noble owner* of which, six years afterwards, killed his neighbour, Mr Chaworth, in a duel. With him in his bedroom, making sarcastic remarks on every article of dress as he put it on, at every glance he gave towards his legs, or in the mirror, were his friends, Captain Clayton, that renowned marksman, and the Nottingham tutor, who had been confessor and adviser in that delicate matter of the heart which occurred to my relative when in London. He lengthened the already too-extended and too-interrupted dressing-time, by occa-

sional glances at the newspaper; a paragraph, and then a turn at the toilet; another paragraph, and then the toilet again. News, however, was the smallest matter in those days. 'Our own correspondent' was not yet allowed the honour of having his entire communication appear in print; the editor skimmed the cream off it, which he presented to the readers after his own concoction. Hence it was that the rector had soon finished the news, and begun upon the advertisements. There was not that sameness which appeared in the London papers, and what there was was a puddle compared with the *concoction* as used in this day; but the advertisements in this midland print averaged from three to six. Prominently, amid these few, stood forth the following:

'If any young clergyman, somewhat agreeable in person, and who has a small independent fortune, can be well recommended as to strictness of life and good temper, firmly attached to this present happy establishment, and is willing to engage in the matrimonial estate, with an agreeable young lady, in whom power it is to bestow £100 per annum—any person who this may suit, may call at the second house in Berkeley Street within four days of this advertisement, having previously left a line directed to A.B. at the same house.'

This smote my grandfather with such a sudden, peculiar, and visible effect, that both his friends inquired if there was any very astounding news in the paper. He laughed, and said there was an advertisement for himself. He tossed it over to them, telling them to read the second from the top. While they were doing so, he himself was the channel of a whole flood of unexpected thoughts and sensations. Here was the perpetual cure for the unenviable *ennui* of village-life, the longed-for talisman to make the rectory-house endurable, nay, even *amusing and* gladsome. A London lady, too; not like some old Nottinghamshire damsel he had been introduced to, who had twice been to the county town, and who thought themselves the cynosure of all eyes at their grandmother's seldom worn pinnet. True, it was a lottery; and among so many he was likely to lose after all. He felt disinclined for the *sub-shooting*.

The captain began immediately to rally him on this advertisement, saying he was evidently disappointed to fit its standard. He spoke the very thoughts that were in my relative's own mind. He advised him to set off for town to-morrow, and to be in the field before any hungry London curate had snatched her up. 'You will be a fool, if you don't try,' said he. 'It will but be an adventure if you lose. But with a military and fashionable expletive,' he added, 'you are sure to win, old boy.'

My grandfather appealed to his clerical friends.

'I will say nothing,' said he. 'You ought to remember what fine things you have told me of, and over again about a certain young lady; *enough* love, and so on.'

The captain informed the younger clergyman that the elder, 'like all other schoolmasters, was a bit, and always remembered his trade was to *laugh* and spoke to men as if they were lads.' A controversy ensued between the priest and the soldier; in which (my grandfather's inclination being on that side, and his opponent also doggedly dumb as to reasons for not going) the man of the sword got the best. He said he would excuse the young parson from the shooting, and so give him time to make ready for starting by to-morrow's coach. The elder parson said he should fulfil a promised call on the father of one of his pupils, and should go into *Bedfordshire* by to-day's coach, if he could get back to Nottingham in time. Accordingly, the captain and my grandfather sat down to breakfast, and the tutor mounted his

* Uncle of the poet.

horse, saying, as he rode off, 'he was sure his friend would sleep off his Quixotic notion of rushing after an unknown lady of untold, and, therefore, of pretty advanced age.'

My anxious relative, however, arrived in town by the next coach, bought a new wig and suit, and having left a letter proclaiming his hopes, called at the address mentioned in the advertisement. He was shewn into a room handsomely furnished, and hung with Mr Hogarth's new prints of the Election, which had only been published a few weeks. Here he sat down in great trepidation, and waited for above twenty minutes, during which time he first gave cool consideration to some of the less pleasant possibilities of his adventure—the chance of the lady being much older than himself, or marked with the small-pox, or stammering, or lame, or possibly squinting hideously.

At last the door-handle sounded, and the door flew open. Guess his surprise when his friend the tutor from Nottingham marched in. My grandfather at first blushed up to his eyes. 'What! we were to appear as rivals, then?' he stammered out—perceiving at the same time *why* his friend, if he might any longer call him so, had dissuaded him, and stolen a march to London under feint of Bedfordshire. In a moment, however, he consoled himself by a comparison of his own person and age with that of his treacherous brother in orders. These thoughts made him silent, and, for a minute or two, also forgetful of his awkward position. Should they see the young lady alone, or together? Had they no other rivals? Possibly, she was desirous of a Nottinghamshire husband, and had advertised in no other newspaper.

The elder clergyman burst out laughing. At this my grandfather was aroused, and laughed also—more, however, to take off his nervousness than from spontaneous sympathy.

'My dear Jack,' said the tutor, 'I see I must give in; I shall stand no chance against a brisk young fellow like you.' And he sprang up and abruptly left the room. My grandfather heard his laugh on the stairs. He began to see that he was being hoaxed, and felt bewildered. How the squires, captains, and parsons would laugh at him!

A moment after, the tutor reappeared, leading in a young lady. How shall I tell my grandfather's surprise? It was that very same maiden whom he had watched and followed at Vauxhall, and sighed after so many times since. To this first happy perception soon followed the second.

'Armida, my love—my dearest friend, the Reverend John Grantley.'

'Jack, my lad—my dear little niece.'

The explanation is very short. The merry old clergyman had perceived from Grantley's clear description, at his very first confession, that the young lady by whom he had been smitten was his own niece, a native of Nottingham, at that time staying in London with his two brothers the lawyers, and with them going the round of town amusements. She had returned to Nottingham before my grandfather. The further he thought himself from her, the nearer he really was—a consideration which often filled his confessor with inward laughter. She had frequently seen him from her father's window; had heard him preach in St Peter's, though hidden from him by the Christmas bushes and the deep wooden walls. She had even been in her uncle's house one day when the young rector called there, and was bent upon seeing and speaking with him; but her determined relative sent her home, promising to arrange an introduction before the month was out. She confessed she liked the look and constancy of her admirer, and entered heartily into her uncle's merry scheme of the advertisement. The captain was taken into counsel as accomplice, and agreed to urge my grandfather to

the departing point. There was no fear of any other clergyman answering the advertisement; for the circulation was too lamentably small, and the contriver knew the habits and property of every other clerical subscriber.

LITERARY LIFE IN GERMANY.

Two graceful and charming volumes are lying before us, to which we would invite our readers' attention.* The author's design is to give a popular history of German poetry, with sketches of the lives of the poets; and this is executed in such a manner that we rise from the perusal with a wonderfully clear view of so extensive a field; while the career of many of the personages is so artistically delineated as to give the narrative all the interest of a romance. We cannot, however, include the verse in this warm commendation, for the volumes, to use a favourite phrase of our ancestors, are 'interspersed with poetry'—consisting of translated specimens of the German works referred to. If those translations are faithful, the specimens must be ill chosen, since they do not bear out our author's criticism; but the most courteous, and probably the most correct, supposition is, that, as usually happens, the subtle spirit of poetry has escaped in the process of transfusion from one language into another.

In the first volume, the history is brought down to the period when in Germany—devastated by the Peasant War, then by the atrocities of Anabaptism, and the more dreadful atrocities in which it was extinguished, then by the Thirty Years' War, which cut off two-thirds of the population of the country—the lamp of poetry, and indeed of literature generally, after one or two fitful flickers, was wholly extinguished. It was later and more slowly re-illuminated at the Revival than in any other country in Europe; but gradually, at length, the spirit of German poetry arose from its ashes, though streaming no longer in the national gushes of a homogeneous character which had before distinguished it. Acted upon by new influences, it was divided into numerous schools, all insignificant when viewed from the column of history, but each appearing great in the eyes of its contemporaries. In the eighteenth century, the prosaic hymns of Gellert, and the lackadaisical idyls of Gessner, procured for their authors unbounded reputation; but, at the same epoch, Klopstock came forth, and achieved a fame that even now, though dimmed, is not altogether extinguished. Then, as time flowed on, Lessing, Herder, Bürger, Wieland, Schiller, and Goethe rose above the brightening horizon. It is not with the genius of individual poets, however, we have anything to do for the present: we wish to inquire into their status in the aggregate as a portion of the literary body; and while obtaining some idea of this, an instructive comparison will unconsciously suggest itself between them and their brethren of our own country.

In England, there is no such thing as a republic of letters; there, each literary man stands alone, and he does not obtain even the personal acquaintance of his fellows in virtue of his calling. It is different in Germany, where literature is a species of freemasonry, in which the members of the craft look upon themselves as brethren, and where these members are

* *Poets and Poetry of Germany*. Biographical and Critical Notices. By Madame L. Davézié de Pontès. 2 vols. London: Chapman & Hall. 1858.

recognised by the rest of the people as belonging to a distinct profession. When the young and poor Klopstock, for instance, the victim of love and poetry, was indulging his dreams and his sorrows by the Lake of Zurich, he suddenly received a letter from the king of Denmark, inviting him to his court, and offering him a trifling annuity in the meantime, and the reversion of some post worthy of his acceptance. When Lessing published his drama, the *Laocon*, he was at once invited, as much to his surprise as delight, to remove from Berlin, and undertake the superintendence of a new national theatre just opened at Hamburg; and when his salary ceased here, and he was reduced to desperation, being in want of the very necessities of life, the Duke of Brunswick, who knew him only by his works, tendered him the post of librarian at Wolfenbüttel. When the Elector of Mainz wanted a director for the university of Erfurt, he applied at once to Wieland, as a man whose fitness for the post was proved by his published books. The poet did not find the situation an agreeable one; but he was soon invited by the Duchess of Weimar to become tutor to the young duke; and various unsolicited compliments were paid to his genius by other princes and nobles. Nor were other classes of the community less discriminating. German authors have usually had a resource in tuition; for the people considered that they who shewed themselves capable of turning to good advantage their own education, must be well fitted to educate others.

Let us not imagine, however, that literature in Germany was, or is now, a flourishing profession in the pecuniary sense of the term. The nobles, although indeed shorn of their beams, were still the dominant party, and they alone were eligible for either civil or military posts of any consequence. They were no longer, it is true, the rivals or masters of the sovereign, who now kept them in their places by means of a standing army; but the very hopelessness of their subjection to the crown rendered them the more tenacious of their tyrannical hold upon the people. They still kept up their heritable jurisdictions, by means of which they fined, scourged, and put to death the peasant tenants; and many of those ancestral privileges remained intact till the revolution of 1848. The emoluments, therefore, even of those literary men who basked in the sunshine of royalty, were not great. Wieland, for instance, when invited to be tutor to the young Duke of Weimar, was offered L.90 a year for his three years of service, and after that, a pension of L.28 for life. But let us not smile at this princely generosity in a country and at a time when beef was seven farthings a pound, veal less than three-halfpence, and house-rent, fuel, &c., in proportion. A thorough maid-servant thought herself well off with less than L.3 a year; a first-rate cook had L.4, 8s.; and a maid-of-all-work not quite L.2. This was at Frankfort, Berlin, or Vienna; in the country, the remuneration of domestic labour was not so extravagant. When Voss contributed to the *Musen-Almanach*, his precarious income was about L.60 a year—a sum which Schiller declared he could live on charmingly with his wife and family—but when he was appointed director of that publication, with a fixed salary of L.70 a year, he at once married his Ernestine, with her anxious mother's approbation, which she had hitherto withheld.

Poverty, however, was, and is, no crime and no shame in Germany. It was never there inconsistent with the highest refinement and the most genial sociality. Look at this picture of the *ménage* of the author we have last mentioned: 'In May 1778, Voss became the husband of her whom he so fondly loved, and bore her back to his humble home at Wandsbeck. As, however, the single chamber with which he had been contented during his bachelor-life was now

insufficient, he hired a little garden-pavilion, and here they established themselves as well as the narrow space allowed. A clear and sparkling rill flowed at the foot of their abode; and the trees and flowers that surrounded it gave it an air of cheerfulness and gaiety which, in the eyes of the young lovers, atoned for the absence of everything but the most simple necessaries. The evening after their arrival, they visited Claudius, and many a happy evening did they spend in his garden, where a chosen few were wont to meet three or four times a week. Every description of luxury was banished as unsuited to the means of the entertainers; neither tea nor coffee was allowed; beer, home-brewed, with bread and cheese, and sometimes a little cold ham, or bacon, were the only refreshments permitted; but the mirth and good-humour of the party required no stimulants; they were as happy as youth, health, friendship, and congenial society could make them. One evening, it was discovered that the provision of home-brewed beer was exhausted, and even that of cheese was waxing low. Some potatoes, however, and a little rice-soup remained from dinner, and with these, Ernestine tells us, they were as happy as princes. "When Claudius came to spend the evening with us, he always bound his little daughter to his back; she was then laid in our bed till his return home." Campe and Lessing were frequently of the party, and joined in all their innocent gaiety.

'We have lingered on this picture of rural enjoyment, because it proves how possible it is to unite the highest literary culture with the simplest mode of existence, the most perfect refinement of mind and manners with the total absence of wealth or splendour.'

This is delicious; but to complete the idea it conveys, we must give a glimpse of a very different interior, that of Wieland, in which refined comfort is heightened by the same genial warmth: 'The house of my friend is at once elegant and rural. It has a fine kitchen-garden extending to a beautiful wood, which, in its turn, stretches to the banks of the river. I dine every day with the patriarch and his four charming daughters in the library, which commands a view of an extensive and verdant meadow. I inquired who was that robust and handsome youth, mowing the grass around a thicket of roses. It was his son. I for my part assist the mother and daughters in their household duties. Country-life reigns here in all its charming simplicity. Goethe came to dine with us the other day; nothing could be more simple than his manners. It was delightful to see these two poets seated side by side, without jealousy, pretension, or affectation, calling each other by their Christian names, as they did in their youth, resembling much less two *beaux esprits* than two good merchants of Gröningen, united by the ties of affection and relationship. The daughters of the great Herder shortly after joined us. Beauty, goodness, wit, genius, and sincere affection—all united in this little room.'

The minnesingers passed away, with the thirteenth century, and the meistersängers were practically extinct at the close of the seventeenth; but the poets of Germany seem gregarious by nature; and in the latter part of the eighteenth century another national association arose of a similar kind, called the Hainbund. The *Musen-Almanach*, already mentioned, was established by them as their poetical organ; and the association in the course of time included the names of many distinguished authors, such as the Stolbergs, Schlegels, and Bürger. The earlier members met every Saturday 'at each other's houses, and there read and criticised their own productions and those of some of more established fame. At times they would assemble in some romantic spot "under the shade of lofty oaks, in the glimmering moonlight, by the side

of murmuring streams or in grassy meads," and there give full vent to that passionate and somewhat exaggerated love of romance and nature which form the principal characteristics of their poetry.' On one occasion they went out to a neighbouring village. 'The weather was most lovely,' says Voss; 'the moon full; we gave ourselves up completely to the enjoyments of nature, drank some milk in a peasant's cottage, and then hastened to the open meadows. Here we found a little oak-wood, and at the same moment it occurred to us all to swear the holy oath of friendship, under the shadow of these sacred trees. We crowned our hats with ivy, laid them beneath the spreading branches of the oaks, and clasping each other's hands, danced round the massive trunk. We called on the moon and stars to witness our union, and swore eternal friendship. We pledged ourselves to repeat this ceremony in a still more solemn manner on the first occasion. I was chosen by lot as the head of the Bund.'

Among the compensations of that tribe whose badge is poverty, we find love the most remarkable. Elsewhere, love is usually an episode; here, it is an important part of the history, its golden threads interwoven throughout the whole web. We have seen literary men introduced by their works alone to such offices as they were supposed to be capable of filling with advantage; but the same works gave them entrance—sometimes personally unseen and unknown—into the hearts of women. Klopstock affords an example of this. A friend one day read to him from a letter some criticisms on the *Messiah*, which struck the gratified poet by their depth of thought and poetical feeling. He learned that the critic was a maiden; and although at the moment smarting under a love disappointment, called on her with a letter of introduction. 'Margaretha Moller was one of the most enthusiastic of Klopstock's admirers. Ardent and imaginative, endowed with talents of no common order, with a heart as warm as her intellect was cultivated, the author of the *Messiah* was in her eyes the ideal of all that was great and good in human nature. To see him, to know him, seemed to her a privilege which would gratify her utmost wishes, but which she could scarcely ever hope to enjoy. Her delight and astonishment may be conceived when she actually heard his name announced. Meta was at that moment engaged in some domestic occupation—no other, we believe, than that of sorting out the household linen—and the room was consequently in no little disorder. Her sister proposed declining the visit for that morning; but the fair enthusiast would not hear of such a suggestion. The linen was quickly concealed, and Klopstock introduced.' In this first interview, at which he found the young lady 'at once so gifted, so amiable, and so charming, that he could hardly avoid giving her the name dearest to him in the world,' a correspondence was agreed upon. He found that she wrote as naturally as she spoke, and that, besides French, she was well acquainted with English, Italian, Latin, and—adds Klopstock—"perhaps Greek, for aught I know."

Meta never thought of concealing her love—a love which marriage had only the effect of increasing. "Since Klopstock and I have met," writes she to her correspondent Gleim, "I firmly believe that all those who are formed for each other are sure to meet sooner or later. How could I ever dream, when I knew Klopstock only by his *Messiah* and his odes, and so fondly wished for a heart like his, that very heart would one day be mine? . . . Even in my thirteenth year, I thought seriously how I should arrange my life, whether I married or remained single. In the first case, I settled how I should manage my household, educate my children, and above all,

conduct myself towards my husband. I formed the *beau idéal* of the consort I should desire, and Providence has given me precisely him whom I had pictured to myself as the type, the model of human perfection." . . . "I must tell you a new happiness," she writes to another, "which increases the number of my calm enjoyments. Klopstock, who had hitherto written out his compositions himself, begins to dictate them to me! This is indeed a delight! Klopstock's first manuscript is always written by my hand, and thus I am the first to read his beautiful verses! Rejoice in the advent of the second volume of the *Messiah*. Abbadona appears more frequently in the ninth song. Do I love Klopstock particularly as the author of the *Messiah*? Ah, for how many causes do I particularly love him! But on this account more than any other. And what a love is this! How pure, how tender, how full of veneration! I am most anxious he should finish the *Messiah*, not so much on account of the honour which will redound to him in consequence, as of the benefit it will confer on mankind. He never works at it without my praying that God may bless his labours. My Klopstock always writes with tears in his eyes!"

The irritable and melancholy Lessing obtained a wife whose admirable qualities acted like heavenly balm upon the spirit of every one who came near her. 'The spell which Madame Lessing threw over those around her could not fail to exercise a potent influence on a mind like that of her husband's, so keenly alive to all that was good and noble. His irritability decreased; his whole nature seemed tranquillised and softened, and the very spirit of love and concord reigned over the little household.' Wieland's first love was unfortunate, although he was beloved in return. His second was so also; and we mention it because the description of the lady shews, what one is inclined to suspect throughout, that the attachment of the German literary heart is determined by qualities different from physical beauty. 'A greater contrast to Sophia could scarcely be conceived. Julia was plain even to ugliness; somewhat pedantic withal, fond of talking with a loud voice and dictatorial manner, not unlike the picture drawn of the gifted and unfortunate Margaret Fuller. Like her, too, she contrived to make all these imperfections forgotten by her intellectual charms, and exercised on every one who came within her sphere an influence absolutely magical. "There is nothing in the world I would not do—nothing that ought to be done, I mean," Wieland writes to Zimmermann, "to win the hand of Julia; but I fear this is impossible." So it proved. Julia was resolved to live and die in single blessedness, and, strange to say, fulfilled her resolution.' Notwithstanding later attachments, however, his early love was never forgotten. At the ripe age of fifty-five, he once more met Sophia. 'Wieland had inquired after her with some impatience, and seemed most anxious to see her. All at once he perceived her. I saw him tremble; he stepped aside, threw his hat down with a movement at once hasty and tremulous, and hastened towards her. Sophia approached him with extended arms; but instead of accepting her embrace, he seized her hand, and stooped down to conceal his features. Sophia, with a heavenly look, bent over him, and said, in a tone which neither clarion nor hautboys could imitate: "Wieland, Wieland! Yes, it is you—you are ever my dear good Wieland!" Roused by this touching voice, Wieland lifted up his head, looked in the weeping eyes of the friend of his youth, and let his face sink into her arms.'

But the loves of the poets is too extensive a theme for our space, and we shall conclude by citing the case of Bürger after the death of his second wife, to whom he was even madly attached. 'Bürger's poems were peculiar favourites among the fair sex, and one of their

warmest admirers was a Suanian maiden, called Elise H——. Young, ardent, and romantic to excess, she had hung with rapture over Bürger's poems; she had listened with pitying sympathy to the recital of his love and his sorrows, and her imagination had pictured him under the most attractive form. Wayward and passionata, thoughtless and unreflective, now glad as a child, now plunged into the depths of sadness—"everything by turns, and nothing long"—Elise was the most charming and the most provoking of her sex. Though far from wealthy, her position was at least independent, and her wit and beauty attracted numerous admirers. As none of her admirers had yet found favour in her eyes, probably because they fell short of the standard of excellence her imagination had formed, she was still unmarried and fancy-free, when the tidings of Molly's [the wife's] death reached her, and awakened feelings which at first she herself scarcely dared to analyse. Bürger, he whose poems had been so long the delight of her heart, now thrilling her with terror, now moving her to tears, was free! That being whom he had so passionately loved was torn from him by the cruel hand of death; and, as Elise pictured his wild despair, his hopeless anguish, his utter loneliness, her enthusiastic soul warmed with mingled tenderness and pity. To see him, to know him, to console him, this was at first the sole end and aim of all her wishes. Gradually others arose—might she not by her love and care reconcile him to that world which was now become a desert to him, and replace his lost Molly in his heart? She did not pause to consider whether a union with a man double her age, who had already twice entered the bonds of matrimony, would be likely to insure her happiness. She trusted to her charms, to her influence, to efface all remembrance of his beloved Molly, and to mould him to her wishes—a delusion which has blasted the peace of many a fond heart.

Among the names mentioned by our author are not those of Goethe or Schiller, or of the writers who have flourished in our own generation; but these will form the subject of a future work. In the meantime, we have thought that it might not be considered an uninteresting or unsuggestive service to deduce from the present volumes some slight account of the compensations of literary life in Germany.

THE SATURDAY HALF-HOLIDAY AND FRIDAY PAYMENTS.

A MEMORIAL from the Early-closing Association has been laid before the governor and directors of the Bank of England, with a request that they would sanction the movement by closing the Bank at two o'clock on Saturdays, and thereby 'confer an important privilege on those engaged in that establishment, facilitate the adoption of the practice in the London banks generally, and at the same time give a powerful impetus to the cause in other quarters.'

Upwards of eleven hundred of the leading city firms have given their hearty concurrence to this proposition, 'believing that no inconvenience can arise to the public from such alteration being immediately effected,' and their names are affixed to the memorial. It sets forth that this generous concession will not only 'enable many thousands of the mercantile and industrial classes, with their families—without infringing on the Sunday—to participate in those interchanges of friendship, and to take that healthful relaxation, which constitute some of the chief enjoyments, and even necessities of life;' but also that an indirect result of great importance will arise from it, in the more general payment of wages on the Friday instead of the Saturday.

It is almost impossible to over-estimate the advantages of such a change. 'When a working instead of a leisure day,' says a committee of the House of Commons, appointed to consider this subject, 'enable the receipt of wages, the workman encounters less temptation to dissipate his earnings at the gin-shop, instead of employing them in the purchase of necessaries for his family. If gentlemen-manufacturers, master-tradesmen, and farmers were aware of the benefits which must result to the labouring-classes from paying their wages on an earlier day than Saturday, especially if that day precede a market-day, your committee entertain no doubt that feelings of kindness, as well as duty, would soon cause the practice to become general.'

And again: 'If the labourer does not receive his wages in proper time on the Saturday to enable him Sunday as a day of rest or recreation, he is manifestly injured by being deprived of that portion of the which it has been the design of laws, both human and divine, to secure to him. If, on the other hand, he receives his wages in time to enable him to make his purchases on the Saturday evening, he is committing an injustice on the shopkeeper by coming him to sacrifice his day of rest by delaying his purchases to the Sunday.'

Nevertheless, we must remember that the absolute and universal stoppage of Sunday trading is impossible so long as the poor are so infamously lodged as they are at present. When seven or eight persons occupy the same room, eating and sleeping, the presence, in addition, of a leg of mutton hanging from the ceiling—which is their only 'safe'—is far from wholesome on the Saturday night, nor is the moral itself rendered more savoury by the process for the evening day; but with respect to commodities which are not perishable, they need never be bought upon the Sunday by persons who receive their wages before the preceding evening. All the weekly labourers in the Queen's employment are paid on Friday, and all those in the government establishments either on that day or before Saturday afternoon; while the same is the case with the Metropolitan and City police force. Moreover, all the Friday-paying firms agree that their men do not keep worse time, and are not less fitted for their duties on Saturday by reason of the change.

The Association, as might have been expected, have indeed been far more successful in effecting the alteration of pay-day than in procuring a diminution of the hours of toil. It is hard to persuade the commercial mind that a few hours given is not a few hours lost, nor does it quite see the necessity of 'refreshing the machine' at all—in the case of other people.

Still, there is a very large minority of hard-headed merchants, manufacturers, and traders, who have sympathized with the early-closing movement, and adopted more or less entirely the Saturday half-holiday, including the Stock Exchange; Lloyd's; the Baltic Coffee-house; a large majority of the insurance companies; the General Post-office and some departments; the railway companies in certain divisions; the distillers; many of the brewers; the hatters; the leather-factors; several of the great printers; the wholesale fruiterers; the wholesale stationers; the wholesale bookellers; numerous merchants and brokers; with all the great warehouses to the north and south of Cheap-side, engaged in the Manchester, Bradford, Leeds, Coventry, Lanes, Nottingham, and Scotch trades. While, as an example of the progress of the cause, 'her Majesty's judges, and subsequently the lord chancellor, have established new rules touching the service of pleadings, notices, summonses, &c., to facilitate the carrying out of the movement in the legal profession; and,

readily availing themselves of these new rules, upwards of seven hundred of the leading London solicitors now close their offices on Saturday at two o'clock.

'The bankers, in some of the principal cities in the north of England, including Liverpool and Manchester, as also in Scotland, have for some years past carried out the half-holiday movement.'

The testimonies of many of the more important firms who have long adopted Early Closing, are very gratifying. It in reality appears that, 'whilst they have thus conferred an important boon on those in their employ, for which the latter are most grateful, they generally get as much work done in the shorter time as they formerly did in the more lengthened hours of business. Happily for the cause, this is no mere theory, which may or may not be correct, but the actual experience of business-men whose names stamp their statements with truth, and who, moreover, could have no motive to mislead the public in the matter. This pleasing result is, no doubt, partly owing to the greater heart, and more thorough concentration of purpose with which workmen naturally apply themselves to their calling when cheered by the prospect of a few hours of extra relaxation at the end of the week; and partly to the augmented restorative influence exercised by that prolonged cessation from toil.'

The employers sometimes require an extra half-hour *per diem*, in order to make up for the Saturday half-holiday, and their labourers are very ready to give it. Without this exaction, however, such a firm as Barclay and Perkins are able to assert that 'they have closed business entirely on Saturday, at two o'clock, for the last eighteen months, and the plan has occasioned no inconvenience or obstacle to the due execution of our regular work; on the contrary, it has resulted in greater convenience to all concerned.'

Chubb and Son 'have closed at 1 p.m. on Saturday, for the last eighteen months, and find the system answers very satisfactorily in both their manufactories (London and Wolverhampton).'

Alexander Grant and Brothers, who close at two o'clock on Saturday, declare that it 'has been very beneficial to ourselves, as well as to our people for whose advantage it was adopted. *We get quite as much, if not more, work done, and a better class of men offer themselves for employment.*

The Patent Galvanising and Corrugating Iron Company has closed at two in the summer months, and four in the winter, and the proprietors 'have found no inconvenience whatever in their arrangement, but quite the reverse, as their men have done precisely as much work since shortening the hours of labour.'

The firm of Truman, Hanbury, Buxton, and Co., whose men leave work so early as at half-past twelve, ~~state~~ this: 'Three years ago, we adopted the plan of ~~giving~~ the men in our employ a half-holiday on Saturdays. . . . We now complete in five days and a half that which formerly occupied six days to do, and this without any inconvenience; and in the long-run we believe we are gainers rather than otherwise by so doing. Our men are decidedly improved; we get better servants, and the work is done more neatly. . . . We pay all our men at eight o'clock each Saturday morning.'

We have no room for further quotations; but nothing can be more gratifying to those who wish well to humanity than such testimonies from practical men to the commercial benefits which ensue from cutting our own fingers to lighten the heavy burdens upon the shoulders of our labouring brethren. Of the moral advantages of such alleviation from toil, no man can doubt who reads the evidence here placed before him.

The physical necessity for some such change is obvious to all who are acquainted with the business

streets of London and our manufacturing towns, and have marked the frames and faces of the passers-by. In Scotland, or rather—as we fear we must restrict ourselves to stating—in Edinburgh, there is no such conflict for the bare life; no such penning in unwholesome atmospheres the whole day long; no such ceaseless offering up of human health at the desk and counter altars, as in many other places. The hours of toil are certainly not so numerous as in English towns; and the Early Closing Movement—the Saturday Half-holiday—is, in addition, generally observed.

THE SCOTCHMAN IN IRELAND.

THE *Times* correspondent and such-like literary locusts would appear to have exhausted the Green Isle and the Irish utterly; but the author of *Ballytubber, or a Scotch Settler in Ireland*,* proves to us that there is something to be said upon the subject still. It really is a remarkable book for some reasons; and not the less that we have in it the Thistle reproaching the Shamrock with its unornamental appearance; the pot condemning the kettle upon the ground of its being black underneath; in plain terms, one who is familiar with Edinburgh Old Town and the Cowgate, giving the rough side of his tongue to the city of Belfast and the sister-land, upon the score, forsooth, of its being overcrowded and not overclean.

Mr Virgilius Penman, as the author calls himself, is certainly not inclined to be complimentary; but there is such an air of truth about what he goes on to say concerning Irish farm-letting, as proves it to be a personal experience. He is himself a Scotch settler in want of a farm. Such excellent demesnes are offered to him (upon paper) in the Irish advertisements, that he scarcely knows which to choose; all 'in most quiet and respectable localities;' all 'in sporting counties;' all 'in the neighbourhood of Protestant churches, good schools, and market-towns.' Some of these turn out to be such as the thriving city of Eden, in the United States, appeared, in reality, to Martin Chuzzlewit and Company; some are only 'put into the newspapers in order to meet the landlord's eye, while, all the time, they are engaged to some one at a certain rent, or intended to be retained in the agent's own hands;' and some 'are advertised solely for the purpose of ascertaining from applicants their marketable value, in order to raise or fix a rent for their present tenants; whereby strangers are often induced to incur long and expensive journeys fruitlessly.'

Let it be granted, however, that the unfortunate settler gets his stock and tillage-farm at last, consisting of 800 acres, and situated in that most civilised of Irish counties, Dublin; and suppose that his horses, cattle, sheep, are all that could be wished, and that he is fortunate in his husband-men; even with these advantages, he is not, it seems, an enviable agriculturist. His wedders are slaughtered nightly, and the skins alone left to tell the tale, while the shepherd who narrates the misfortune is himself privy to the crime; or the sheep again suffer, and this time by a reverse of the felony, their wool being taken and their bodies left torn and bruised, and perished with the cold; or the manes and tails of the plough-horses are found shorn to the skin, and even the tails of the milch-cows laid under contribution.

The settler's most difficult task, however, seems to be the management of some twenty farm-labourers: five of whom, being men, are appointed to the horses;

* Houston and Wright. London. 1858.

and fifteen women, ten of whom without shoes or stockings, in short, with one-third of their fair superfluities in *paris naturalibus*—their heads, in most instances, uncovered—their vestments consist chiefly of the cast-off attire of both sexes, tucked together by pins and threads, and their hair smeared into cakes by *ham-grease*, and folded up under a ribbon; others have it hanging in slattern folds about their ears, or twisted like snakes around their temples. At six o'clock A.M., the work of these farm-labourers is (supposed) to begin; and at the same hour, allowing an interval of two hours from eleven to one, they (very readily) retire. The wages for women are 8d. per diem; and for men, from 16d. to 18d. Let the unfortunate farmer relate his own experience of day the first:

Day the First.—With the sound of the morning-bell, precisely at the hour of six, our illustrious husbandman enters the field. One only of his ploughmen is up to time; one has forgotten his hame-sticks, and has left his horses grazing by the way until he "just go fetch them;" another has let slip out of his hand one of his spirited mares, and is pursuing her about the farm; the fourth has slept in "because his wife was sick;" and the fifth has gone to the forge, having neglected to go on the preceding evening. . . . Of the number of females engaged, two only are forward at the hour appointed, and these are a soldier's widow and daughter. About an hour hence, a noisy band, singing and frolicking on their way, is seen advancing on the field; and at every hour or half-hour from this till past noon are stragglers coming in. The morning, it is true, has afforded a sorry start; but patience is a virtue, and hopes are entertained of a full muster for the afternoon. At the hour of one the roll is called. Twelve tell up; for though the complement has now appeared on the ground, three of the number are missing—gone off to meet their little boy or little girl, their brother or sister, who was to fetch their "bit o' bread and sup o' tay."

Day the second is not much better, and day the third is worse; so that, if we are to believe the author of *Ballynabber*, the Scotch emigrant in search of a farm, who is not gifted with the patience of Job and the purse of Fortunatus, had better go further afield than into the sister-island. Nevertheless, as Mr Penman does stay in the place after all, one may conclude that things get better in time. Here is a description of one of the best contrivances, perhaps, for making them better that has yet been hit up by those interested in Ireland's welfare—namely, Court of Encumbered Estates. Its importance causes us—in true Irish fashion—to end our notice of Mr Penman's experiences with an account of that institution, without which they would never have begun. The court is held in Henrietta Street, and the auction generally commences about noon.

You approach from this street through a goodly dwelling-house, now converted into offices in connection with the business of the court; thence by a long and narrow passage in the rear of this building to the court-room itself. On entering the disenchanting hall, you will naturally uncover, unmiadful of the counter-example of some gentlemen you will see there—they are up from the wild countries where a new hat is a novelty, and Baron R—— is a man of feeling. Taking your stand or seat as accommodation will afford, and running your eyes over the interior of the chamber, you will see a vast number of men seated on the different rows of benches; some with sharp, lively, trickish looks; others with sad and sorrowful countenances; and some, again, complacently watching at their ease the progress of the business. These three divisions of the company are the lawyers, nominal owners, and intended purchasers; and each order may readily be distinguished

by the various expressions and emotions impressed upon their features. Some, you will perceive, are following the biddings with a nervous and visible anxiety; others engaged in the perusal of and pencil on the margin of *Rentals*; whilst a third order are making notes, and conning over legal documents. The scene, viewed apart from its merits, has something grave and impressive in moral effect; relating, perhaps, as it may, to some once noble patrimony, some once hospitable but now deserted habitation, where festivity and mirth seemed to promise endurance with the rising and setting sun, about to depart for ever from one whose name has been identified with the soil, whose lease or manorial tenure, once counted by centuries, is now within a few months of its eventful end—the glory of an illustrious ancestry about to be forever severed from the territory which some noble founder had "called after his own name!"

THE FIRST DAY OF JUNE

SWEET June, I greet thee on thy birthday morn
With song and gladness; now my heart grows young
As many blessings on its chords are strung
As bright-eyed flowers thy new-worn robe adorn.
Hail to thy coming o'er yon eastern hills,
Treading on gorgeous clouds whose humid folds
Are steeped in heaven's own purple; the high red
Gleam on thy path like gold; thy glory fills
Mountain and vale, the meadows and their streams;
The sweet birds in the forest are awake,
And of a new-born joy like mine partake—
The whole earth of its primal Sabbath dreams,
While fragrant airs in wooing whispers come
Kissing the opening flowers to brighter bloom.

J. R.

A MAINE LAW THREE HUNDRED YEARS AGO.

When whisky was first introduced into Scotland, it appears to have been used only as a medicine, and to have been long strictly used under the lock and key of the medical practitioners, as it now is within those American towns where the Maine Law is rigorously enforced. It was by the sympathy and support of the people, and of the medical practitioners of Edinburgh—the college of Surgeons—in 1505 united in their own persons the rather incongruous duties of surgeons and barbers, and, in that capacity, applied to the town-council, in accordance with the customs of the age, to be formed into a separate incorporation. The town-council granted the prayer of their bill and supplication, by issuing the 'seal of cause, granted be the town-council of Edinburgh, to the crafts of Surgeons and Barbers,' dated July 1, 1505. In the spirit of the times the document—amongst other exclusive privileges conferred on the newly incorporated body—provided and declared 'that na person, man nor woman, within the burgh, mak nor sell any aquavit within the samyn, except the saidis maisters, brother and freemen of the craft, under paine of the escheit of the samyn, but (whar) favours.' This charter was ratified and confirmed by an act of the parliament of Scotland, passed in the reign of Charles I., November 17, 1641. The whisky-bottle had thus been in the exclusive keeping of the medical profession for nearly a century and a half, and by this act, it appeared to be irrecoverably placed in their hands.—*Rise and Progress of Whisky Drinking in Scotland*, by D. MacLaren. Edinburgh: Oliphant.

LATTER-DAY COACHMEN.

AN elaborate monograph on the omnibus-drivers of London, and their interesting congeners the conductors, would prove an invaluable contribution to the natural history of mankind. Philosophers are much to blame for having allowed the habits of this important class of beings to escape their observation; and unless they make an early attempt to fill up the deplorable hiatus that exists in our knowledge, we shall cease to regard them with anything like respect. My own researches have led me to place the omnibus-driver between the fossil stage-coachman and the modern railway-guard, as I am convinced that he partakes of the nature of each of these distinct types. My endeavours to assign a true position in the chain of being to the conductor have unfortunately been less successful. The peculiarities of the driver are not well marked, owing to his transitional character. Now, his thick shawl wrappings, his countless capes, and his purple visage, recall the old stager; and now, his trim figure and jaunty air remind us of his connection with the railway official. The conductor is subject to still greater variation, his forms being truly Protean. Now he seems a curate; sometimes one might mistake him for a decayed tradesman, a man about town, a ticket-of-leave holder, and sometimes, wonderful to relate, for a gentleman. My local habitation is situated at a nice inconvenient distance from Charing Cross, and my frequent journeys to and from town afford me many opportunities for studying the physical and mental characteristics of bus-men.

The Brown omnibuses pass my door every quarter of an hour. From nine o'clock till eleven, these celebrated vehicles are crowded with government officials, West-end banking-clerks, wealthy tradesmen, and all those varieties of the human race comprised under the head of men of business. I have an indescribable dread of these early passengers, and seldom venture to accompany them. They converse in a language I do not understand, and make free use of those mysterious words *consols*, *dividend*, *percentage*, *stock*, and *discount*, the true import of which I have never been able to master. All these early commercial birds look as if they had picked up the golden worm, and they all bear the mint-mark of respectability. The old gentlemen who ride inside, and sit staring at each other in grim silence, are unquestionably respectable; so are the severe fathers of families who discuss the state of the money-market on the front-seats; and so, indeed, are those pale-faced boys in long coats and tight collars, who smoke huge meerschaums and

fat cigars on the roof. Nevertheless, I would rather not ride in such good company. I would rather wait till noon, when the mothers and daughters of our suburb begin to besiege the Brown busses, when the driver is being continually requested to pull up for another lady, and when the conductor hears nothing but a rustle of silk dresses and a clanking of iron hoops. The fair ones are bent on shopping, and will return in a few hours loaded with ducks of bonnets and divine mantles. Of course they ride inside, and I have seldom anybody to dispute with me my right to the box-seat.

My favourite driver is young Webb, a stripling over whose head some sixty summers may have flown. I do not know how the veteran came by the prefix of *young*, but young Webb he is, and young Webb he will remain, until his turn comes to take a trip in that dismal black omnibus which carries only one inside. His youthful spirits may have procured him the title; but I am inclined to believe that there is an old Webb hanging about the stables, and that my young friend is his son. This opinion is not without foundation, as mysterious allusions to the 'old party' are not uncommon in the driver's speeches. Young Webb looks out of place on an omnibus, and feels his degraded position acutely. He drove four horses in former times on the broad Oxford Road—a fact which he takes care to mention every time he sees me. He dresses in a costume approaching that worn by him in happier days, when, as he says, 'nobody thought them railways would answer, and when coachmen was almost as well cared for as bishops.' A light drab-coat ornamented with large pearl buttons covers his portly person; gaiters of the same colour protect his well-shod feet, and an ancient beaver-hat with a broad turned-up brim shades his rubicund face. The hot weather does not seem to affect him in the least, and he holds blouses and straw-hats in great contempt. Plenty of beef and an extra allowance of porter, he assures me, keep his head cool in the 'blazingest' weather. Young Webb is very communicative; but it is rather difficult to get at the meaning of his enigmatic sentences. I will endeavour to report a conversation we held together a few days since; but his speeches want a running accompaniment of winks, elbow-nudges, and flourishes of the whip, which cannot appear on paper. We were passing the establishment known as Mr De Fluke's Homœopathic Institute, when I ventured to address Young Webb on the subject of that medical man's capabilities.

'Oh, you want to know something about the doctor, do you? Wery likely. Perhaps this ain't the

right shop though; perhaps you'd better apply over the way, with which establishment there ain't no connection.'

'Do you know the gentleman?' I asked as mildly as possible.

'Do I know him? Ah, now, I see what you're driving at. I know him fast enough. If he wasn't a awful vagabond, he'd perhaps be a most respectable man; but what might be, and what is, is two very different horses.'

I assented to the truth of his last proposition, and requested to be furnished with further particulars.

'My opinion don't stand for much, sir,' continued the mysterious driver; 'but I generally knows what o'clock it is at dinner-time; and it's my private opinion that Dr De Fluke is a cure. Now, I'll just give an idea of the man as he is, leaving what he might be out of the question. This is him to the life. He's got a long white calico blind always drawn down to the very bottom of the window, and a gold-headed cane, and all the rest of it. When the shutters is shut, Heaven only knows—but I suppose it's after everybody's abed, and when they're opened, I can't say, I'm sure, but very likely afore everybody's up. Oh, he's a peculiar party, that he is!'

Not exactly seeing the connection between the doctor's shutters and his private character, I asked my friend to explain the hidden meaning contained in his words.

'There's nothing to explain,' said he; 'the calico blind speaks for itself. But that ain't all. There's his advertisements in the penny papers about his invincible pills which ain't feasible. (Webb is very proud of this adjective.) I'm sure I hope them pins' heads may do the folks as takes them as much good as they does him; but what I hopes, and what I believes, is also different horses. But that's not all, sir. Look here—he's actually got a gallows-great letter-box in his front-door, with a hundred and forty-nine letters in it—all of them stuffed full of postage-stamps. This is merely a headline of Dr De Fluke. If you want to know more about him, you go over to the Markie of Granby and have a drop of something warm—ginger-brandy, with a little bit of sugar, is very good, but rum-shrub has its merits. If you light a Hawaiian afterwards, I'm not the one to find fault with you. When you've taken your drop of comfort, just go to the bar and ask for Crispy the postman, and they'll bring him out to you. Then take him very quietly aside, and whisper in his ear that you want to know something about the doctor; and tell him that young Webb sent you. Oh, he'll give you full particulars, he will! Oh, he just is a cure, and no mistake!'

At this moment, Mr Webb pulled up for a passenger, who had scarcely seated himself when my friend asked him whether he knew anything of Dr De Fluke—'a most respectable party, sir—most respectable!'

The mythical personage alluded to as Crispy the postman, is Webb's authority for everything. It was only yesterday that he refused to give me any opinion as to the probability of having wet weather until he had 'reckoned it over' with Crispy.

Mr Higgins is a scholar and a gentleman, though he condescends to drive the one o'clock omnibus. His tastes are literary; and he passes much of his time in 'putting together some verses on a coachman's life.' Start not, reader! there are 'mute inglorious Miltons' on the box-seat, as well as elsewhere; nay, improbable as it may seem, I can bear witness to the artistic powers of a conductor! Mr Higgins is a severe critic, and does not spare the highest reputations. He will tell you that such a writer isn't of much account, that another is going to the dogs, and that a third had better shut up shop. He makes up, however, for the abuse he so freely bestows on some writers, by the lavish praises he awards to his favourites. He

almost worships Eliza Cook, and is for ever quoting her poems, introducing each recitation as 'that pretty little verse by Miss Eliza,' or 'one of Miss Eliza's best.' He invariably asks me whether there's anything new in the book-line, and is extremely easy when I reply in the negative. When he hears a new song, he makes a note of it for my especial edification. 'I heard a pretty little thing last night, sir,' he will say. 'I gave a little musical supper to some friends from the country; and one of the young women—my wife's cousin, in fact—sang a song I think you'd like to have a copy of. I'm sure I forget the name of it; but it begins: "Alone on the desert, alone, all alone—Alone on the desert am I." Then I think it goes: "My good steed has fallen, my pathway is flown"—then—I forget how the last line comes, but it's something about being "left here to die." It's a sweet pretty thing, if I could only remember it. You see, sir, it describes how a poor fellow wanders away from the caravan which contains his wife and family, and is overcome by the heat and the dry roads. However, just as he is at the very last gag, the bells of the camels are heard tinkling in the distance, and he and his animal are saved by the proprietor of the caravan. It nearly made me into a fool of myself, I can assure you, sir; and I felt quite relieved when Mary Anne (that's my wife's maid) began jangling a bunch of keys in imitation of the camels' bells.' Mr Higgins has promised to turn me with a sight of his own composition, which I am convinced must be a literary curiosity.

James is a sporting driver. His face is long and thin like a horse's; the brim of his hat is perfectly flat; his coat is short; his waistcoat is long, and his trousers fit so tightly to his legs, that I have come to the conclusion that he must sleep in them. I think he has a notion that I am a horse-watcher, and is always asking me to put him up to a good time in the Ascot cup. He divides time not by the Gregorian, but by the Hacing Calendar, and talks of the *Flying Dutchman* year, the *Teddington* year, and so on, as if all the world could understand him. James is not an interesting person, nevertheless he is his admirers, and more than one of the conductors owe by him.

Omnibus-driving has an acidifying effect upon most dispositions, at least I should judge so from the chronic peevishness of old Baxter, with whom I have often a little skirmishing-match. He labours under the delusion that he is a victim of continual persecution. When he is not at amity with his passengers, he will inform them of the cruelty of his master, who expects him to work night and day for a paltry little bit of dirt which is scarcely worth pecking. Sometimes he will rave at the other omnibus companies, and point to the miserable condition of their vehicles or animals upon the upstart incapables who are intrusted with the reins. Stoppages in the north work him up to a pitch of frenzy, and will, I think, some day bring on a fit of apoplexy. Whenever he is at a loss for a topic to grumble at, he falls upon his conductor, who appears to be a very old youth, but who, according to the driver, is both wiser than a bend in more or less human shape.

There are a few of the varieties of the genus *humanus* which have fallen under my immediate notice; countless others equally interesting await the coming of the monographer who shall classify and name them.

The cad or conductor has been much commented upon. He is considered to be the embodiment of all that is low and brutal. Even Hon Gaultier speaks disparagingly of him in that celebrated line:

I hold the gray barbarian lower than the Chinese who which is equal to saying, that the cad is the most degraded type of civilised man. For my own part

I have generally found the cad to be a sprightly good-natured creature, rather too fond of indulging in 'chaff,' but capable of displaying considerable attachment to his regular customers. It would be impossible, within the narrow limits of this article, to do justice to my favourite conductors, but I cannot resist a temptation to lay before the reader a characteristic anecdote of Mr Edward Brown, or, as he is sometimes called, Smart Ned.

My friend Bilberry sometimes accompanies me to town; and as he has a strong objection to mount the box, I sacrifice my own comfort on the altar of friendship by riding inside. Bilberry is a popular lecturer of considerable fame, and what is more to the point, a very charming companion. He is a huge man, with a jolly round face, which is slightly tinted by the best of claret. He dresses in a very clerical style; and his turned-up hat, gold spectacles, and black suit, gave him the outward semblance of some high-church dignitary. A few mornings ago, we met at the corner of the road, and waited for our omnibus, which happened to be the one to which Mr Brown is attached. On our way to town, I could not help noticing that worthy's frequent glances at my portly friend. Every now and then he would peep cautiously into the vehicle, and look at Bilberry's hat, his shoes, or his spectacles. At last he dismounted from his elevated post, and took up a position on the step, so that he might enjoy an uninterrupted view of the lecturer. He seemed completely fascinated with the massive gold spectacles, and never averted his gaze for a moment. At Charing Cross I got out, and Bilberry followed. Brown touched his hat to him with a reverential air.

'Beg your pardon, sir,' said he; 'may I speak with you a minute?'

'What is it, my man—what is it?' asked my friend.

'I'm afraid, sir, you'll think me very rude, but the fact is, me and the driver has a bet on about you.'

'A bet about me, man? What do you mean?' Bilberry is rather irascible, and will not be trifled with.

'Well, sir, it's rather a ticklish question to put to you, but ain't you Cardinal Wiseman?'

'Cardinal Wiseman?' roared Bilberry, flourishing his cane. 'Do you mean to insult me, you impertinent rascal. I have a very good mind to—'

My excited friend could not finish his sentence before Smart Ned had slammed the door, mounted his perch, and shouted out at the top of his voice: 'All right, Bill! Drive on! It is his *Hemisphere*!'

SOCIALISM IN GREAT BRITAIN.

Some years ago, the present generation witnessed what we may probably regard as the last expiring efforts of a school of political and social reformers, whose name is perhaps more unpopular and less respected than that of any other sect of philosophy. The extreme section of the Republican party in France, and some of the most earnest and liberal members of the clergy and laity of the Church of England, were each engaged in their respective countries in endeavouring to lay the foundation of a new system of society, by which all the worst evils of the present phase of human affairs were to be avoided, and which was to elicit, sooner or later, a complete moral revolution throughout the civilised world. The failure of the political Socialists of France, and of the Christian Socialists in England, was complete and decisive; it is not likely that we shall, during the lifetime of the present generation, see another attempt made

to carry out in practical experiment the principles of the economical system vaguely denominated Socialism. This being the case, it is possible to inquire into the nature and abstract merits of its doctrines at more leisure, and with more impartiality, than could be expected at a time when the questions at issue were presented in a practical shape, and appeared as subjects of political contention rather than of philosophic discussion. And, though such an inquiry may savour somewhat too much of a 'warring with the dead,' which is at once unprofitable and undignified, it has its value both for those whose minds have been attracted by the brilliant promises of the Socialistic writers and speakers, and for those who have rejected their system as a monstrous and palpable absurdity, without any very clear idea of its character, or of the definite objections which have been conclusively urged against it. There are thousands of the working-classes, and among them often the most intelligent and estimable, who have neither forgotten nor wholly lost faith in the doctrines which they or their fathers first learned some quarter of a century ago. They cling to the idea that existing evils, and the inequalities of human conditions, are the fruit, not of any causes within the control of the sufferers, or beyond all human control whatever, but of an abnormal state of society, which might be cured and rectified, but for the obtuseness of those who are not stung into reflection, and the selfishness of those to whose lot have fallen the prizes of fortune. Holding this belief, they are naturally and rightfully discontented with their fate, and disposed to murmur against all who are more happily situated, as against those who keep them out of their due.

These are men who deserve attentive and respectful sympathy; and the social theories on which they rest their hopes of a good time coming are entitled to be heard with patience, to be elucidated with fairness, and to be refuted with care and in good feeling. The horror with which the name of Socialism is still regarded in the spheres of sober and commonplace conservatism, had its origin in the associations attached to it by the earlier and less-considerate professors of the doctrine. The idea which the term is intended to convey is simple enough. As generally used and understood, Socialism implies the association of labour, while Communism infers the association of property. The Socialist advocates the extinction of all competition for employment or for custom, for profit or for wages. He would organise the industry of the country after a republican fashion, dividing among the labourers the produce of their toil, instead of a stipulated sum in wages from the master-capitalist, to whom that produce now belongs. He would have the labourer to work not for a master, as in our factories, nor for himself, as on the small farms of France, or in the small workshops of Britain, but jointly for himself and his fellow-workmen. The Communist proposes, in addition, that the produce, instead of being divided, shall be held in common property by all. These theories are put forward, not as plans to be forthwith carried into effect by a sudden and violent revolution in the whole frame of society, but as the natural and most hopeful development towards which civilisation should tend.

The unhealthiness, folly, and mischievous nature of competition is the idea that lies at the root of the idea. Competition is regarded as the master-evil of society; nor—unreasonable though it be—is this view unnatural. It is not surprising that men, seeing

only the mechanism through which an effect is produced, should mistake that mechanism for the cause. It is but as if some one, not seeing the engine at work, should attribute the motion of the wheels and shafts to the revolving fly-wheel. It is natural that men of sensitive benevolence should be pained and outraged as they witness the ceaseless jar, and jostle, and struggle of life. It is terrible, in very truth, to see how, in every business, in every rank and grade of existence, men are crowding one another out of the comforts and decencies of life—sometimes actually elbowing one another out of life itself—merely in the effort to make their own way, or even to maintain their own ground. It is not wonderful that men more philanthropic than philosophical should regard this scramble and strife as wanton and needless, and attribute to it the sufferings of which it is the instrument, forgetting that, if it were to cease, while the want of room continued to impede progress, stagnation and suffocation must be the result.

The great object was to discover some system of social arrangements by which the present evils and inequalities of human life might be avoided or redressed. Believing that these misfortunes sprang principally or wholly from the competitive principle which underlies all existing social institutions, and from the selfishness which it engenders, something to supersede this mainspring of society was sought for. Association and organisation from without, instead of organisation naturally arising from competition among the individual members of the social body, were expected to remodel the world. By this means the socialists hoped to insure that every man should have a sufficiency of leisure, and an adequate share of the produce of the common labour. By this means they hoped so to adjust the supply of all articles of desire to the wants of the community, as that neither scarcity nor repletion should ever afflict them. It was their intention so to distribute labour among different occupations, as that none should ever be unemployed because his particular trade was overstocked, or should be forced to labour day and night for a remuneration which hardly sufficed to save him from dying of hunger. It was their endeavour, moreover, to pave the way for a juster and more equal distribution of the produce of human labour and abstinence, than at present exists. Pure Socialism, as the word is understood in this country, would achieve this simply by a more equitable method of partition, and by such a general diffusion of education as would preserve and elevate the classes now poor by reason of ignorance and vice. Communism, with less patience and more audacity, would sweep away at once all inequalities of fortune, by destroying at one blow the institution of private property. The writers and preachers of this doctrine propose to return to that which may not improbably have been the first condition of human society, and which is not unlike the form of proprietary rights subsisting among the nomad tribes of the east. The community, state or family, is to be the sole proprietor; distributing to all, not according to their deserts, but according to their needs. All labour is to be employed and directed by the state; the produce is to belong to the state, and the state is to be responsible for the comfortable maintenance of each individual citizen. Now, there is the widest possible difference between these two theories. The former proposes simply a different organisation of industry from that at present subsisting; the latter demands a complete reconstruction of human society, hardly to be accomplished without a radical change in human nature. The objections to the schemes of the Socialist lie in matters of practice and of detail, and amount on the whole to this—that the plan could not be made to work, and that if it were set in action,

its working would produce results of very questionable benefit to society. Communism is liable to objections far more vital and fundamental; as a theory which could only be carried out by the annihilation of all existing rights, which would be an enormous retrogression in civilisation, and could hardly be to prove most fatal both to the material and the moral wellbeing of mankind. It seems exceedingly improbable that, under a system which should render it impossible to dismiss a labourer for idleness, which should deprive him of the stimulus to industry afforded by the stern necessity of earning his bread, and under which he would derive only as thus inappreciable individual advantage from the immediate results of his toil, men would labour as diligently and heartily as when their present and their future comfort, if not their very existence, depend on their own exertions. One great economist, who is inclined to look with favour upon the communistic scheme of society, expresses a strong belief that the influence of public opinion would be sufficient to prevent any man from shirking the task assigned to him. That influence, in a community so constituted as to give the feeblest possible effect, would be very powerful, we can hardly doubt; but it is by no means certain that it would obtain labour half as effectual as that of a workman at present paid by the piece, and it is very likely that many men will be found to labour as sedulously for the community as they would for working on their own account and for their own sake.

In thus speaking of Communism, we are comparing it of course with the best developed portions of the actual fabric of industrial organisation, and not to still more healthy forms towards which it may aim to tend. Tried by this test, compared with the condition of the intelligent and well-paid mechanic of such a peasant-proprietary as exists in Flanders, Switzerland, and the western provinces of America, the Communistic state of society will appear to most minds evitable, beneficial, or attractive. But to the Dorsetshire peasant, whom daily have to be supported on eight or ten shillings a week, or to the London seamstress who earns some shillings a day at most by sixteen hours' constant toil, the position of the member of a community in which there should be no unequal poverty, and no grinding overwork, must seem an object of fervent desire. It appears, then, that a social system based on the institution of private property may be made far more desirable than that of Communism: it is equally certain, that there are phases of our present system which amply justify those who believe that a more irremediable under that system in sighing after one in which there should be no poor.

It must not be forgotten, however, that under a Communistic régime, all those restraints which are at present mechanically effected by the necessary operation of our social institutions—restraints of indolence and indulgence, coercion to industry, and to economy, checks on an increase of population more rapid than that of food, and the like—must be artificially imposed by the legislation of the community, and enforced by penal statutes. Numberless matters which now are regulated by the necessities inherent in what may be called the individualistic organisation of society, or, at least, to individual discretion under the inevitable pressure of those necessities, must under Communism be ordered and settled by law. What scope there would be left for individuality of thought and action, what degree of personal freedom could exist under such a system—cannot be accurately determined, but we can hardly doubt that a tendency towards the tyranny of a most oppressive uniformity would be one of the very worst perils involved in the theory of the Communist. In this respect, his doctrine cannot

most unfavourably with the work of the practical Socialist, whose 'labour-partnerships,' at least so far as they have yet been actually tried, have done much to develop individual character and personal dignity on the part of their members. That the tyranny of a Socialist organisation which should embrace the whole industry of a country, leaving all trades and workmen at the mercy of a vast centralised administration, would be intolerably severe, no clear-sighted person can well doubt. But the habit of working together with others in a self-governed association, with the feeling of strong personal interest in the work done, and in the dignity of independence which is so highly prized by the educated British workman, is a training, moral and industrial, than which it would not be easy to devise a better.

A few such associations are still flourishing, of which we need only advert to the most successful—the Rochdale Co-operative Store—which does infinite credit to the working-men who founded and managed it, and which has been the best possible school, in every sense, for all connected with it. Institutions of this kind may, and generally do fail, either from want of capital or from want of the necessary qualities of patience, prudence, resolution, and mutual confidence and forbearance on the part of their members. But there is no reason whatsoever why, if these requisites be found, they should not achieve success; and there is every reason to wish that they should do so, as much for the sake of the virtues they call forth, and the valuable lessons inculcated by their difficult struggles towards security and prosperity, as for the material benefits conferred on those who belong to them. When organised by the working-classes themselves, and kept in their own hands, they may be made most valuable instruments for the elevation of their members both in moral worth and temporal wealth, and for the material and educational improvement of their neighbourhood. And perhaps not least among their advantages, we may reckon the insight they can afford to the working-class into the practical truths of political economy; into the hard necessities of commerce, of which they are not the only victims; and into the true nature of those laws which, when their operation is severely felt, they are inclined to break, as mere excuses for the selfishness of masters or the avarice of landlords; into the possibilities of their own future, and the means by which the highest and happiest of those possibilities may be realised; as well as into the practical value of those exalted ideas of a coming industrial regeneration, and a triumph of Socialistic principles which perhaps inspired them at the outset. Those who have talked with the working-men who have had experience of the management of these concerns, cannot fail to be struck with their superiority to their fellows in soundness of thought upon economical matters, and by their more rational views on the questions peculiarly interesting to their class. Were such institutions more commonly successful, and such knowledge and judgment therefore more generally diffused, it is probable that much of the money and time wasted, and good feeling destroyed, by fruitless and irrational strikes, might have been spared. Whatever might be the views of the original teachers of Socialism, it is quite certain that the only portion of their work which has taken practical root in this country, is so far from being hostile to the wellbeing of society as at present constituted, that no better education could be found for the working-classes than the establishment in every large town of such co-operative associations as the Rochdale Store and the Leeds Corn-mill. The test of practice has been applied, and has effectually separated the really valuable principles from the mass of error and extravagance in which the preachers of Socialism had

buried them; and in doing so, it has shewn how much of sound sense lay at the bottom of a theory which had been pushed to such irrational extremities.

OUR NEW ORGANIST.

THE old man who for upwards of thirty years had been organist of Waldon Cathedral, was not forthcoming one spring morning: being sought for, he was found dead in his bed.

When at Waldon—this was never for very long at a time, though not exactly young, I was still in my *Wanderjahr*; I had often officiated for old Jackson; and now, at the bishop's desire, I took upon myself the trouble and responsibility of appointing a new organist.

Waldon—for reasons of my own, I do not speak of my native town by its right name—is a very behind-the-time, out-of-the-world place; my gazetteer says that it is 'chiefly noted for its cathedral, a magnificent, cruciform structure; and its palace, the residence of the lord-bishop of the diocese;' but I do not think that it is 'noted' at all. Nevertheless, though I have travelled much, I have never seen any building that appeared to me so imposing and grandly suggestive as Waldon Cathedral; but then I have that familiarity with it which breeds, not contempt, but truest reverence for what is truly admirable. I own a house in the cathedral-yard, in which I was born, in which I hope to die.

For some months after the death of our old organist, I was a reluctant occupant of this house of mine. As spring gave place to summer, my impatience to escape from the drowsy heat that settled down on Waldon was great. The two or three ignorant and self-complacent young men who alone applied for the vacant situation, received questionably courteous dismissal.

One sultry midsummer evening, my thoughts turned with especial longing to Norwegian fjelds and firds, I rose from my organ practice abruptly, and left the cathedral by a small, low side-door, of which I always made use. The bishop was absent. I went to stroll in the palace-grounds, and, remembering that in the morning I had needed a work of reference, which I knew to be among the ancient volumes in the library above the cloisters, I obtained the key of the library from the bishop's housekeeper. Afterwards I sauntered beneath the ancient trees on the close-shaven lawns, the while denouncing the stifling heat, a good time; then I paced the wall above the moat dividing the palace-grounds from the cathedral precincts. Presently I fancied that I heard the tones of the organ. I had left the door ajar, the organ and my music-book open. Rather indignant that any one should intrude into my domain, the organ-loft, I left the palace-grounds immediately. As I passed into the cathedral-yard by the heavy arched-way, from which an avenue of glorious old limes leads to the principal entrance, I was startled by a full burst of rich harmony; it died away as I reached my little door. Just within it, I paused and listened: I was not disappointed; the organ again sounded. Open upon my desk I had left a collection of intricate fugues; these the unknown musician began to play. I detected signs of diffidence, and of ignorance of the resources of the instrument in the style of the player; but I also detected the presence of feeling, refinement, enthusiasm.

'This man will do,' I thought, as I listened. 'He needs confidence and practice, but he has genius. Ah, ye Waldonites, ye shall slumber through your services no longer! The power of music shall stir ye.'

Twilight was gathering; fine full chords melted into silence; the instrument was not touched again. I proceeded to mount the stairs of the organ-loft. It chanced that I still had in my hand the key of the library; unfortunately, I dropped it, and the consequent

notes, echoing from arch to arch, no doubt alarmed the musician. Having reached the organ, I drew back the curtain, prepared to address the unknown. I found there—no one. Of course, the player had descended one stair as I mounted the other. I leaned over the loft, gazed down into the dimness of the vast building, and listened intently for the sound of a footfall. I heard no sound, and was inclined to doubt if human fingers had pressed the keys that night. But there was my book of fugues, not open where I had left it—a spirit-musician would hardly make use of letters.

I presumptuously called upon the unknown to come forth, unless he desired to be locked in for the night: only the echoing of my own voice replied to me. I shook up the clownish boy who had blown the bellows for me, and still clambered in his niche. He could give me no information; had 'drownd' from the time I left off playing till the playing began again, and had seen 'naught nor nobody.'

No one was now lingering in the building, I felt convinced; so I departed, locking the door behind me; but I scuntered a long time beneath the lines before I could persuade myself to go home.

Next evening I practised again, playing with revived enthusiasm, perhaps in unconscious emulation of the unknown, who might probably be listening. From time to time I peered between the curtains; I saw no one save an old man hobbling about examining the instruments, and a child or young girl whom I had, as it were, noticed, without remarking, for several afternoons, occupying a dim corner during the service. Both had disappeared when I next looked.

I left Mozart's Twelfth Service open on the desk and departed. I took up my station behind a tree, and watched the tempting open door unflinchingly. I had bidden the boy remain in his niche, ready to blow for any performer. No one passed in at that door; yet by and by the playing commenced. It drew me on into the building. The choicest passages of the service were exquisitely played by more assured fingers than those of yesterday; this was evidently familiar music. When daylight entirely failed, the performer began to extemporise, trying the full powers of the instrument, of which I was justly proud. Strains of what seemed to me unearthly sweetness, and weird strangeness, rooted me to the spot. Sometimes I gazed into the mysteriously stirred duskness of the building, sometimes fixed my eyes upon a star glimmering above the piney top of one of the solemn phalæx of ancient trees, so unflinchingly still, so perfectly defined against the delicious clear tone of the summer night-sky. I guarded the only exit; the musician could not escape me, unless indeed— But I did not consider myself to be superstitious, yet I vividly recalled an unexplained mystery of bygone years.

I and my chum of that period lived for some time up among the queer gables of a quaint German town, in the house of a professor of music. At that period, I was studying musical science. One day I sat at the piano in an inner room, poring over a blotted manuscript score, while my chum smoked and read metaphysics in the outer chamber! My brain was perplexed, and the difficulties at which I stuck seemed insurmountable. In desperation, I ran down to the professor's library, and rummaged among musty tomes for any passages that might throw light upon my perplexity. I found what I needed in a mass of Alessandro Scarlatti's. I mounted the steep stair slowly, reading as I went. Suddenly I heard my instrument struck, and paused, rather surprised. My chum was ignorant of the simplest rule of my art.

'The old professor,' I thought, as I listened to a passage which was a perfect and exquisite illustration of the point which I had needed to have illustrated.

I waited till the music ceased, that I might not lose a note, then rushed up stairs, and burst in upon my busy friend. He removed his pipe from his lip, and opened his dreamy eyes widely. 'Hallo! I thought you were in the other room,' he exclaimed.

'Who is there?—the old professor, or—the old—?'

My chum rose; we entered the inner room together, and found no one. Everything was as I had left it. Dusky sunshine from the begrimed lattice checked my music-paper. We looked round, then at each other. My chum shrugged his shoulders. My many eager questions produced this answer: 'I don't understand it, any more than I understand this,' tapping his book with his pipe. 'I saw you here that door'—pointing to that of the outer room—'and after heard a grand strike-up; thought you had perhaps returned while I dozed; saw you appear, looking as if you were slightly demented. That's all, don't pretend to explain. If it were a ghost who played, I fear I have been mighty disrespectful, for I said out: "Well done, old boy."'

We knocked about the furniture, rattled a caddy fastened-up door, which evidently had not been open for ages, and led only to an unsafe wing of the mothering habitation, till it threatened to come to pieces under our treatment, but we obtained no clue to the mystery, and again looked blankly into each other's faces. We never did obtain the slightest clue to this mystery. As I leaned in the porch of the cathedral that night, I twisted the incident I have related all ways, striving to account for it in what would be a rational manner. In vain.

Something passed by me, stirring the air, making no noise. I started up, stood erect; the last vibrations of sound were dying out. What had passed me? Was I thwarted? Had the musician escaped me? I looked the door behind me, looking in the uniform boy, and hurried after a something that faded away close to the wall of the building. Obligated to leave that shelter, it kept close to the trees in the avenue, and proceeded very rapidly. I ran.

An oil-lamp flared under the arched way, yet there I overtook the form I had pursued. But it was only the child I had noticed lingering while I practised. Then my musician was, I flattered myself, safely locked up. But the child must have come on, as she had lingered over since the service. The musician must, too, have lingered, no one having passed in since I had kept watch.

When I overtook the young girl, I found she was not quite a child; she paused, and turned upon me a small sickly face. I felt foolish before the odd questioning of her eyes, and the meek dignity of her manner. I muttered some excuse for frightening her.

'You did not frighten me,' she answered.

'You have just left the cathedral—you have been the playing. Do you know who the musician is? Did any one pass you as you came away?'

'You were in the porch. I passed you. I have seen no one else.'

'No one else! Yet you must have seen a the cathedral ever since service, or I should have seen you later. I want to speak to the person who played. Surely you can help me to find him.'

Her eyes fell, and she seemed to me to half shrink within herself. Just then, an elderly woman stepped under the arch from the street without; she put her girl's arm under her own, and led her away, scolding her for not having come home earlier.

As I returned to the cathedral, my mind nagged me; I reproached myself for having let the girl escape me, feeling convinced that she might have aided to solve the mystery. She had not and she could not help me, but had evidently hesitated. I had now little hope of securing the unknown musician to-night; but I opened the door cautiously, and called

the boy. He came whimpering; he had believed himself a prisoner till morning. Regardless of his distress, I demanded if he had seen the organist.

'She give me this (showing a shilling), and went away the very minute she'd adone playing.'

'She!' It flashed upon me.

I had spoken to the musician then! that alight, plain young girl. She would surely come again—I would secure her. That night I had strange dreams of musical mysteries, and of a wonderful child-organist, whose playing made the solemn limes perform a stately minuet in the cathedral-yard.

Next evening I set my trap—the open door and instrument—and watched. She had not been at the service; I had searched every hiding-place; I watched in vain—in vain for many successive evenings. Yet I felt sure that it was but a question of time and patience; that the attractions of the place would prove irresistible.

I was very observant of the Sunday congregation, and of the few persons who collected to listen to the afternoon services. Once I believed that I saw the wished-for face; but a beflowered bonnet, lifted up determinately after having been bowed down in drowsiness, interposed. I gave up lingering about in the yard of an evening, and ensconced myself instead behind the screening jasmine at my window. An evening came on which my patience was rewarded. I had left upon the organ-desk the *Stabat Mater* of Pergolesi, that Domenichino of music. Well, just after the cathedral-bell had tolled seven, a slight figure flitted through the arched way, and passed swiftly up the avenue, then took the path branching off to the small door; here it hesitated a moment, then disappeared within the building.

I sprang up and clapped my hands, crying: 'There is no mercy, no hope of escape for you.' I leaped from my window, and crossed the yard bare-headed; before a note had sounded, I had stealthily ascended the organ-loft. I did not mean to shew myself at once; I would assure myself that this was my very miracle.

I peered through the curtain: the young girl was eagerly pulling off her gloves—from such slight, childlike hands! She looked at the music before her discontentedly; evidently she did not know it. She turned the leaves, softly trying one passage and another; her face brightened with intelligence and interest.

The girl-musician was not pretty; till she played, her face wore a dejected expression; when you did not see her eyes, it was lustreless and insignificant. By instinct, she seemed to select the finest passages of the music before her; and as she proceeded, joy irradiated her mien; scintillations of light shot from beneath the lashes of the absorbed eyes; lines of thought and power appeared on the young brow, and a smile of satisfaction made the mouth very sweet. She had forgotten all but the music. I could have sworn then that the sickly girl was perfectly beautiful—no mere girl either, but a woman with an angel's face. By and by she paused, and covered that face with her hands.

When she removed the hands, and looked up, I stood beside her. She did not start; she rose and stood before me, steadily meeting my eyes, varying expressions gathering into hers; at last she slightly smiled. I had meant to be peremptory, to reprove her for the trouble she had given me, and to command her to become our organist. I found myself speaking with the utmost gentleness; there was nothing of pride or triumph in her smile, it was infinitely sad—a smile of resignation.

'If you wish, this shall always be your place. Nobody but you and myself (I would not abnegate my right) shall touch these keys.'

A shy, startled joy came into her face.

'Our organist died in the spring. We have been without one since: you must fill his place in this cathedral.'

'Are you not the organist?'

'No; I only play for love of it, and when no one else is here to do it.'

'Are you the bishop, then?'

'No.' I laughed. 'But I am a friend of his. I appoint you the organist of Waldon Cathedral.'

She looked at me to ascertain if I were mocking her, if I were to be trusted; her face grew very bright, but she shook her head.

'I am too young; I should get frightened. I should not play such music as ought to be played here.'

'I am the best judge of that: I will try you. I will call at your home, and arrange with your relations.'

'I have not any relations; but I have a friend whom I must consult. I will send her to you with her answer to-morrow.'

'Your answer must be "Yes;" and I will do all in my power to make your duty easy and pleasant. Will you play no more to-night?'

She shook her head; so, as it was getting dusk, I closed the organ.

'Promise me that, in any case, I shall hear you play again,' I said.

'O yes, if you wish it.'

'You have not asked my name, or where I live.' I gave her my card, having followed her to the door. She paused there, looked back into the building, and then out at the noble limes.

'It would be beautiful to live here always. Good-night; you have made me happy; I was afraid you would tell me I might not come here again.'

I said 'Good-night,' but followed her still: it looked such a spirit-like little form gliding before me in the twilight, that I felt reluctant to lose sight of it. I hinted as much; but under the arched way she paused to dismiss me. If she were a child in years, she had a woman's impressive, because meek dignity. I was impatient for the morrow.

As I sat at breakfast, a book open before me, but my eyes watching the sunlight slanting on the grotesquely carved figures and rich tracery of the facade of the cathedral immediately opposite me (sometimes my idle days were almost wholly passed in this intent watching, till I could have believed my life to have passed into the shadow I saw stealing more and more of the building from the open sunlight)—as I sat thus, Margaret, my housekeeper, informed me that a 'middle-aged female' wished to see me. I desired she should be introduced directly, and recognised the woman who had joined the young musician under the gateway the night she had tarried in the cathedral so late.

'I've agreed that the young lady shall play; it's pleasure to her, and we are but poor,' was the answer to my eager inquiry.

The business part of the matter was soon arranged. Our good bishop caused the organist of Waldon Cathedral to receive a handsome salary, and the woman became eager that the child's duties should begin at once.

'I have yet to learn the young lady's name,' I reminded her.

'Alice Hall. She's an orphan. I was a housekeeper in her mother's family. They're all gone, and left Alice nothing; and her father was only a music-teacher. We're but lately come from Jersey, and know no one in this town.'

'Miss Hall has friends in Jersey, then?'

'She has no friend in the world but me.'

Mrs Smith—that was her name she told me—turned

back from the door to inquire of me if I knew of any small house out of the town and near the cathedral likely to suit her young lady. I was glad to be able to point out to her a pretty cottage on a slight elevation in a meadow behind the cathedral, which was at that time to let. I despatched Margaret with Mrs Smith to look over the Mead cottage, and to introduce the stranger to its landlord.

I had appointed to meet my little friend in the cathedral at eleven—she was punctual to a minute. Her guardian accompanied her, and settled herself with her knitting on a wooden bench just at the foot of the organ-loft stairs.

This morning, I was teacher. I shewed Miss Hall all the peculiarities of the instrument, and heard her play through some of the last organist's favourite services, telling her that, by and by, when she was at home here, she should play anything she chose.

'It is a misfortune for a musician to have such hands as yours,' I remarked.

'I try all I can to stretch them,' was answered apologetically.

I should have liked to take the tiny, supple things into my own, to feel if they had any bone at all. Of course, I did no such thing; their accidental contact affected me strangely. I did not yet feel so very certain that our little organist was made of merely ordinary flesh and blood.

I made her pay me for my trifling assistance by playing for me Scarleth's Requiem. She knew it well, and rendered it exquisitely. Exquisite is the word for her playing; it was so finished and perfect, though not wanting in power and passion.

When her guardian summoned her, several hours had elapsed, yet I was reluctant to let her go.

I did not praise her; but she pleased me greatly—she was different from any woman I had ever known—in a high degree grateful and intelligent. Already I wondered that I could ever have thought her plain.

For a few days yet I was to play the services. Each afternoon she sat beside me. One would have thought that I was some great master, and she a simple ignorant, so closely and admiringly she watched me. She had the unconsciousness and modesty of genius in an eminent degree. She always looked pained, as if she thought I mocked her, if I descended from the eminence on which she had placed me, and hinted that my gift was less perfect than hers. She had also, as I soon found, the inexhaustible industry and patience of genius—morning and evening found her practising in the cathedral.

'You have had a thorough musical education,' I observed to her one day.

'My father lived for music, and devoted himself to teaching me. It is two years since he died, and I have been starved for music, and his love, since.' There was a thrill of passion in her voice, and the tears started to her eyes. 'Here I shall be happy,' she added calmly. 'I felt sure of it the first time I entered the cathedral.'

'You must have been very young when'—

'When papa died? I was nineteen; now I am twenty-one. I am often taken for a mere child.'

'Alice, Alice! It is time to go home,' Mrs Smith cried.

Miss Hall was to officiate first on a Sunday, because I planned it so. On the Saturday evening I found her nervous, tearful, and deadly pale. I repented my tyranny, offered to play for her, that she might, as she had wished, accustom herself to her duty by first playing the afternoon services to a small audience.

'No. You are very kind, but I ought to play to-morrow—it is my duty. Shall you be very vexed if I make some great mistake?' She looked at me wistfully.

'I will take care that you do not do that.'

'Will you be near me?'

'Where I am now—ready to turn the pages.'

'That makes it all different,' said the child. 'I thought you would be down among the people, and that I should be quite alone. I do not mind now.'

Her words touched me—my eyes grew moist. 'God bless thee, dear child,' I murmured as I looked after her retreating form that evening.

Next morning I went early to the cathedral to arrange things as I thought Miss Hall would best like. She, too, came early, looking pale, but quite composed.

I watched her throughout the service. She played perfectly. Yes; she was quite to be relied upon, this child; yet how she loved to rely upon others. When all was over—the cathedral empty, and her beautiful voluntary finished—she lifted her eyes to my face as I bent down, removing her books.

'How good you are to me! I could not have borne it all if you had not been by me!' she said.

'I think you could. I think any way you would have managed to do your duty well. Never mind that, however; it is time you went home to rest.'

In the evening, she was no longer pale; her eyes did not seek courage from mine: she had no thought but for her music, and played with intense fervour. I did not tell her how the congregation lingered in the building after the service, how many glances were upturned to the curtained gallery where she sat, nor did I afterwards repeat to her the admiration I heard expressed of her performance. Why not? I hardly knew; certainly not because I feared to make her vain—she was far too pure and simple. I fancy I was jealous that she should hear from others warmer praise than I had ever conceded, and chose to believe her quite content with my content.

Our new organist continued to practise with untiring diligence. I saw her at least once, often twice each day. Each day she looked brighter and happier—music was healing her of inward sorrow, removing the sad sense of desolation. Truly she had been starved: now she could satisfy her soul with music. As for love—was I as a father to her?

There came an evening when I was allowed to walk home with Mrs Smith and Miss Hall. Before passing through the arched way out of the cathedral-yard, Alice looked back lovingly:

'Would it be possible for me ever, anywhere, to forget this place,' she said musingly. 'It seems so holy. I am so happy. It is like a dream. When I die, aunt (so she called Mrs Smith), I should like to be buried very near the cathedral.'

'No need to speak to me of such things, Alice; please God, you'll live many a year after I am underground.'

'I do not wish to die,' she answered.

Pressing her hand, which lay upon my arm, against my heart, I longed to gather her dear self to my bosom—the gifted heavenly-minded child!

That night I was invited to sup at the Mead cottage. I had opportunity of observing the elegant neatness—sign of dainty household ways—which pervaded Alice's home. I perceived how the same refinement that characterised her as an artist, informed the humble details of her daily life. When I went home, many things in the arrangement of my grander house displeased me—there were faults of commission, yet more of omission: evidently, a central something was wanting.

The bishop returned to Waldon. I introduced our young organist to him, and he soon began to make a pet of her; fruit and flowers from the palace-garden frequently found their way to the Mead cottage. Everything was satisfactory; there was nothing to detain me in Waldon; still I delayed to start upon my long-planned tour.

Charmed weeks flew by. A cathedral quiet and sacredness was over my whole life. A longer stay than usual in Waldon had often before intolerably irritated me; the ceaseless, silent preaching of the solemn cathedral seeming to tempt me, in some way, to desecrate its holiness; its unvarying, unregarding calm making me doubly conscious of the turbulent passionateness so successfully concealed under my old-fashioned aspect. Now, all was different. My being seemed in harmony with all things lovely, calm, and pure.

I was invited to spend a musical evening at the palace; our young organist was to be there. On her account, the ancient and handsomely inlaid piano, which had long stood in the mullioned window of the episcopal drawing-room, had given way to a splendid instrument of modern construction. By the by, I had long seen that the Waldon young ladies were jealous of Miss Hall. They treated her contemptuously; and it was beautiful to see how to their haughty reserve she opposed a perfectly simple and self-respecting humility. After a primitively early tea—the cathedral chimes told five as we sat down to the table—we all strolled among the brilliant flowerbeds upon the close-shaven lawns. The good old bishop kept Alice by his side, because she was friendless—no one else noticing her. I contented myself with looking at her.

Alice had now been three months at Waldon, and by this time I did not doubt her perfect moral and physical loveliness. She certainly had altered since she first came; the sickly hue of her skin had changed to a clear, pure pallor; the look of dejection had given place to one of deep-seated content; her large gray eyes shone lustrous, and seemed to well over with feeling and genius. I was familiar with each subtle charm—each droop and natural wave of her soft, brown hair; the course of each vein meandering beneath the snowy skin on her fair temples; the graceful line of her bending neck; the rarely beautiful outline—But, O Heaven! I must stop myself.

On this evening, Alice was dressed as simply as usual: her gown was of lilac muslin, to the hue of which the evening sunlight gave a lovely bloom. She glided along by the bishop's side, now and then lifting glad artless glances to his kindly face. Sweet child! she was happy; he loved her. She was always happy with those who loved her.

I had lived in a dream so long, that it was difficult for me to throw off its influence. I did not join myself to any of the groups around me; by and by, I stood quite alone on a little mound, a screen of shrubs between me and the strollers. I stood still to watch the sunset light glide up the sculptured cathedral stones—higher and higher, touching face, flower, foliage; up and up till it failed from off the pinnacle.

I heard my own name uttered by a voice behind me—a voice I knew, a hateful, purring, treacherous voice—then I heard these words:

'She is shockingly affected; a dreadful flirt! It is disgusting to see how she has got on the old bishop's blind side. I wonder if the chit fancies she might be a bishop's lady!'

'She flies rather lower than that,' said a kindred voice. 'She and Mr — (never mind my name) go on in a way that is quite shocking—in the cathedral too. Of course, they call it practising—a very pretty kind of practice!'

Of course the tabbies spoke of Alice. My blood tingled.

I pushed through the drooping branches and confronted the creatures.

'A charming time for sweet and charitable discourse, fair ladies,' I remarked; then passed on towards the house.

A pair of soft eyes questioned me wistfully when I entered the drawing-room; they met a new expression in my answering look, perhaps; they drooped, and a rosy flush crept up to the veiling lashes.

My cathedral calm was desecrated; her eyes had never before so drooped before mine. When I went home, I found a letter awaiting me. It summoned me north, to the death-bed of the only relative I had in the world. Alice and I were alike in our friendlessness. I immediately went to the coach-office to secure a place by the morning mail. Even now there is no railway within many miles of Waldon. I occupied the night in packing, and in selecting music, and writing most minute directions for the organist. This done, I hesitated. Should I write to Alice anything beyond these instructions—anything personal, private? I decided that to do so would be to deprive myself of somewhat of my measure of pure delight: I did not wish to lose one glance, blush, smile, or tear. I did not expect that my absence would be a long one. In the hurry of departure, I forgot to tell Margaret to send the parcel I had prepared for Miss Hall; but as it was addressed to her, she would surely receive it, I thought. My relative lingered. Each day might be his last, they said; yet he lingered a month. Then business detained me; then, perhaps owing to my anxiety to return to Waldon, I was attacked by nervous fever, a complaint I had suffered from before.

It was on a grim December night that I at last re-entered Waldon. Leaving my luggage at the coach-office, I proceeded homewards. I was so cramped by cold, and exhausted by fasting, that I could hardly drag my limbs along, and my brain was in a state of feverish excitement. Alice had been present in most of my sick visions—her face always of deadly pallor and reproachful expression. It haunted me; and, as I had re-entered Waldon, vague apprehension stole over me drearily.

Midnight began to strike as I passed through the arched way into the cathedral-yard. The wind became very high, sobbing and sighing about eerily; it parted the clouds, and let through a half gleam of moonlight to make luminous the moving low-hanging mists. At the further end of the lime-avenue I believed that I descried a human figure: it branched off towards my little door of the cathedral. I tried to overtake it: it vanished, passing in at the low porch. The clanging of the clock had ceased, and I imagined that I detected the sound of the organ. I paused. Yes; low wailing notes deepened to a full gush of minor harmony; then melancholy cadences sobbed away into silence. Chilled to the heart—conscious of icy fingers among the roots of my hair—I opened that door, which I found fast locked. I groped my way into the cathedral, believing nothing so little as that it was earthly music to which I had listened. In the building, all was now silent. I crept on, with a tremulous voice calling on Alice's name. My open arms embraced a cold form; my senses left me.

When the ghastly wintry dawn crept down upon me, I found myself lying at the foot of a sculptured female form. 'Alice is dead' was my firm conviction. I managed to rise, and creep to my house. I did not understand how I came to be in the cathedral.

My aspect frightened Margaret. The first thing my eyes fell upon on entering my room, was the packet I had prepared for Alice. 'Returned after her death,' I inwardly commented. I was too miserable to be fully conscious of my misery. I brooded stupidly over a newly kindled fire, while Margaret bustled in and out on hospitable thoughts intent.

'When did she die?' I asked stolidly, by and by.

'Nigh a month since, sir.'

A long pause.

'Who plays the organ now?'

'Please, sir, take your hot coffee, and get to bed. Time enough to bother about organs when you look less like a corpse,' was added *sotto voce*.

I repeated my question doggedly.

'Well, she does it all the same,' was the weird-sounding reply. I had swallowed one cup of Margaret's hot, strong coffee, and life was rekindling within me.

'Are you mocking me, woman?' I cried.

She stared at me, and then gave some soothing answer. Evidently she feared I was deranged. I made a mighty effort to appear composed.

'Margaret, tell me immediately the name of the person who now plays the cathedral organ.'

'Alice Hall, sir; the same who has played for six months now. She went off sudden, and it made no difference to Miss Hall, as it might have done to some, sir: she has not missed a service.'

Again Margaret appeared to find cause for alarm in my face.

'Do you mean to say that for the last month, since her death, the cathedral organ has been played as it used to be in her life?'

'Yes, sir; it has, sir.' Margaret backed towards the door as I rose.

'Played by a departed, a disembodied spirit; and you take it all as a matter of course.'

'Law! Good gracious, sir, I never said anything of the kind. Some say Miss Hall looks like a ghost; but she isn't one yet.'

'Margaret! who then died a month since?' I put the question solemnly.

'Mrs Smith, sir, who used to live with Miss Hall, went off in a fit, quite sudden, as I told you plainly, sir.'

'Leave the room,' I commanded.

I cannot say what I did or how I felt when left alone.

By and by, I rang for Margaret. I explained to her my recent illness, and as much as I could remember of the incidents of the night. Having taken some trouble to convince her of my sanity, I again dismissed her. Poor, poor Alice! dear, desolate child! I reproached myself bitterly for having selfishly thought of my own delight, not of her peace; and I tormented myself by imagining what she could possibly think of me—of my having left her without one word of leave-taking, or one sign of remembrance. The parcel she had not received.

I went to the cathedral early. I found that Alice was already there. Unseen, I watched her a while. She looked faded and worn, and was dressed in mourning; she had lost her only friend—for I had no right to hope she still considered me as such—and must feel herself indeed alone. Yet angelic peace and steadfast faith stole over her weary aspect as she played. Oh, well I remember the sweet upturned face, the droop of the soft hair down the thin cheek. My darling!

By and by, she paused, and took her hands from the keys to draw her shawl closer, with a pale shudder. I stepped near her. Because I hardly dared speak to her at all, I spoke as if we had parted but yesterday: 'You should not be here on such a morning.'

'And you are come home at last?' She held out to me the hand I had not offered to take. On seeing me, she had grown paler than ever; but when I spoke, gladness beamed from her eyes, to be soon quenched in tears as she saw me look at her mourning-dress.

There was a silence of some moments.

'You have missed me?' I asked humbly.

'Yes, yes.'

'And can you ever forgive me?'

'Forgive you!' she echoed.

I held her hand firmly, and over mine came trembling her free hand, thrilling me by its voluntary, undeserved caress.

'You have been ill—I fear you have been very ill,' she said gazing at me compassionately.

I was glad to make the worst of my case.

'I have been very ill. I have much to plead in excuse of my silence and neglect; but not enough, not half enough, if it has given you pain. You tremble. I frightened you by my sudden return.'

'No, no: you never frighten me; you never pain me. I have been sad and lonely; but I know you would return, if you could—if you ought. You have always been good to me: it would have been wrong of me to think of you unkindly.'

'Why did you shudder but now?'

'I remembered a dream, a dreadful dream I had last night.'

'Tell it me.'

'I had rather not.'

'I have a reason for wishing to know it.'

'I dreamed that you were dead—that I sat at the organ at midnight and played your requiem.'

Again she turned very pale. I think I must have done so too. A queer thrill went through me, as, for the first time, I fully recalled the events of the past night.

'You must let me take you home,' I said. I released her hands, and folded her shawl closely round her.

Looking straight into my face with her dear, innocent eyes, she said:

'You must not spoil me so; if you had not, I should not have found it so hard to do without you.'

This was just too much for me. I gathered the little thing into my arms, kissed her sweet brow again and again, and cried:

'Alice, you must let me keep you always—you must be my wife!'

She disengaged herself; she drew a little away from me.

'I know that you are very good. Is this because my aunt is dead, and I am alone?' she asked earnestly.

'It is because I love you.'

My eyes confirmed my words; hers drooped, and her face looked as if the sun were faintly shining on it through a ruby pane in the window.

The Mead cottage was so desolate that I once took Alice—(not Hall) home to my home in the cathedral-yard. It was on New-year's Day that the good old bishop married us; and ever since my happy home has been perfectly ordered, and, so she tells me, my perfect wife has been entirely happy.

New-year's Day—the tenth anniversary of my marriage. To-day I have been looking over my papers, and have read through this, written five years since. O Alice, Alice! my wife, my wife! Why couldst thou not visibly tarry with me unto the end?

I never leave Waldon now. No fingers but mine must ever touch those keys here used lovingly to you. She was to me as child, wife, all of kin, my my darling! I am having built a new organ, a glorious one; it is to be my gift to Waldon Cathedral, on condition that the old one is taken down five-and-twenty hours after my death, and destroyed; and that during those five-and-twenty hours no mortal finger touch its keys. I say five-and-twenty hours, because on the midnight after my death—and I might die just after midnight—Alice will play my requiem, as I heard her so long ago. The organ must never sound again after that. There is a rumour in Waldon that the organist has been mad since his wife's death. I am not mad, because, for my comfort I know that my love was selfish, my guardianship careless, my tender-

ness ungentle, my sympathy imperfect, compared with that my darling experiences in Thy keeping, O Lord, my God and her God.

Such is the paper that lately came into our hands. We have learned that at the cathedral, here called Waldon, the congregation, of about half-a-dozen persons, assembled one grim December afternoon, were detained after service by the powerful beauty of the voluntary performed by their long feeble organist. It came to an abrupt conclusion—the organist was found with his arms folded on the keys, his cheek rested on them—dead. His wishes with respect to the old organ had long been known: they were strictly regarded.

THE BASS ROCK AND ITS TENANTS.

THE Bass is a solitary, precipitous rock in the Firth of Forth, rising to the height of 420 feet sheer out of the sea. An easy journey of a couple of hours takes you from Edinburgh, and lands you at Canty Bay, a small secluded fishing-station on the coast of East Lothian, immediately opposite the rock itself, which being only two miles from shore, is here readily accessible by a boat.

Within such close proximity to the smiling, richly cultivated lands of East Lothian and Berwick, and at a distance of but three-and-twenty miles from the northern metropolis, it is strange indeed to think of the scene of wild animal life presented by this solitary rock, the annual retreat of thousands of sea-birds, which wing thither their weary flight from the eastern shores of America, and the far-off rocky coasts of Greenland and Labrador. Viewed from Canty Bay, the island presents nothing very striking with regard to its external aspect, saving its abrupt elevation from the sea, and, in sunny weather, a certain white glimmering appearance. But upon nearing it in a boat, it gradually and steadily rises in majestic grandeur upon the view, till its lofty cliffs seem to tower to a dizzying height overhead, impressing the beholder with a feeling of awe.

Like many other rocks on the British coasts, and indeed all over the world, this has yielded to the constant wearing of the winds and waves, and has been gradually broken away in rectangular fracture, leaving a system of ragged shelving nooks on those sides most exposed to the violence of the elements; namely, the east, west, and north. Thus the Bass presents to those points a high range of perpendicular, and in many places, overhanging cliffs, and is accessible only from the south. This peculiar conformation seems to have been taken advantage of when state-prisons were more in vogue than now; for to this day may be seen the remains of fortifications, barracks, cells, and dungeons, once tenanted by many an unhappy captive, and zealously guarded by a governor and troops at that time stationed permanently on the island. History has handed down an interesting account of those state-prisoners, together with the proceedings which led to their incarceration; and I may as well here state, that not only have ample details of the martyrology been furnished in a volume called *The Bass Rock*,* but likewise treatises on the civil and ecclesiastical history,

geology, zoology, and botany, severally—436 pages having been written by authors of the highest repute on a lonely sea-girt rock of but one mile in circumference! Were it solely on account of its relics of bygone times, the Bass would be well worth a visit, especially for the antiquary and artist, as the cell in which worthy covenanting John Blackadder, and others were confined, the governor's house, and the fortifications generally, are in a state of tolerable preservation. My tastes, however, are for the natural history of this singular island, more especially the multitudes of sea-birds which make it their home.

Several species of birds breed on the Bass, but by far the most numerous is the solan goose or gannet. This is one of the few stations in Great Britain selected by it for breeding purposes: the other places principally resorted to are Lundy Isle, off the coast of Devonshire; Ailsa Craig, on the Ayrshire coast; St Kilda, in the Hebrides; and Sulliskerry, between the Orkneys and the Butt of Lewis. A few other places of minor note are sometimes chosen by straggling members, but those are exceptions, and as such, are not worth mentioning.

On my first visit to the Bass, I was much struck by the novelty of the whole scene. As the little sailing-boat neared the rock, I decried considerable numbers of geese sailing on poised wings round and round it; but at the first discharge of a gun, the air became partially darkened by the multitude of birds that quitted their ledges and launched forth into the air. Whole tribes of kittiwakes—a bird of the gull genus—flew screaming from their nests, and kept up their deafening shrieks for many minutes; while parties of guillemots and razor-bills quitted their retreats silently, and flew far out to sea. But the greatest sight of all was the extraordinary number of solan geese that filled the air, sailing round and round the rock in long graceful sweeps. Looking up from a boat towards the cliffs, one is surprised that so many birds should find room on such apparently narrow ledges, to construct their nests and rear their young in safety; but doubtless the great height creates a deception as to the size of objects.

The habits of the solan goose are somewhat peculiar. These birds are, strictly speaking, gregarious; they arrive at the Bass in the beginning of February—a few birds heralding the approach of the main body—and remain there till October, for the purpose of hatching and rearing their young. By far the greater number then depart for the American coasts, some going southward to the Mexican Gulf, and others northward to the shores of Greenland. A few birds remain on the British coasts all the year round, but these are always very much scattered. The number of geese that annually comes to the Bass is estimated at about ten thousand. On their arrival, they at once set about the weary process of constructing their nests: a weary process indeed, from the time required to accomplish it, and the long distances frequently travelled in search of materials. The nest is composed almost entirely of sea-weed, to procure which the bird flies many miles from home, returning with the material in its mouth. Sticks are not altogether rejected, though sea-weed is preferred. The nest requires constant repairs during the season, as great heat shrivels its proportions, while moisture decomposes and enlarges it. It is about fifteen inches in diameter across the top, and several inches deep; and in it is deposited one egg about the size of that of an ordinary goose, but longer and harder. From the exceedingly awkward motions of the gannet, while quitting or returning to her nest, the egg would in all probability be soon broken, were it not coated with a hard calcareous substance, to

* London: Hamilton, Adams, & Co.

protect it from rough usage. On rare occasions, two eggs are laid in one nest, and I have been told that in these cases one of the young is much smaller than the other. Though the solan is an extremely awkward bird on land, and shuffles clumsily off her nest when scared by intruders, the instant she launches forth from the cliff into the air, her motions are graceful and easy. Her wings measure six feet from tip to tip, and her flight consists of a few regularly timed beats, followed by a long elegant sweep of several hundred yards: these sweeps are usually in a direction towards the sea, and continue till the bird arrives within a few feet of the water, when with an elegant curve she ascends till the impetus is exhausted, and then has to beat her way upwards again. At other times, the solan goose will sail round her sea-girt home for hours at a time, apparently enjoying the exercise: multitudes are to be seen thus engaged, crossing and re-crossing, and following each other in long gliding downward flights, or winging their way homewards after having been many miles away.

To procure food for the young one, the solan will sometimes wander thirty, fifty, or even ninety miles from home. Young herrings form the chief sustenance, and these are carried home in the old bird's gullet, and disgorged for the benefit of the hungry little one. The method of obtaining fish is very remarkable: Nature has gifted the bird with keen organs of vision, and with these she keeps a constant look-out when on a foraging excursion; if a fish is seen, the gannet stops her flight instantly, and gliding perpendicularly down like a shot into the sea, secures her flabby prey with usually unerring certainty; the middle claw and the sides of the bill are serrated, which enables the solan goose to retain a firm grasp of fish with either the foot or mouth. It is a beautiful sight to see those birds hovering over, and diving at a shoal of herrings; scarcely an instant elapses before one of their number makes its rapid descent into the waves, throwing up a torrent of spray, and leaving a white mark in the sea, discernible at the distance of a mile; and one after another swoops in rapid succession, playing as it were a game at follow the leader, and driving an immense herring-trade the while. The solan will sometimes dive from the height of six feet from the surface of the sea, and at other times from elevations ranging from twenty to fifty feet. I have never seen the bird dive from apparently greater altitudes, nor have I ever seen one stop, as if balked of its prey, while on the swoop. The swoop is similar to that of the falcon or sky-lark, the wings being folded close to the body. When emerging from the sea, the gannet rests for a few moments, and then flaps lazily out of the water. She seldom if ever swims continuously, and never dives from the surface. If over-gorged with fish, she will rest on the water for several hours at a time, and in this state these birds are frequently caught by fishermen and others.

The food is disgorged sometimes into the mouth of the young solan, and sometimes into the mouth of the parent bird, for the young one to help itself, but more frequently by the former method. The young is at first of a leaden-black colour; it is totally helpless, and very meek and submissive in appearance, as may be seen from the manner in which it receives occasional spiteful usage from its neighbours, during the absence of its parents. This, however, is compensated by the tender solicitude of the mother while feeding and rearing it. I am not aware that the male bird assists in rearing the young one, though, I believe, he acts his part in foraging for food, and laying it before the female while she is on the nest, for I have seen disgorged pellets so placed.

On the Bass, there are several distinct colonies of geese, apart from those that breed on the cliffs, and the stranger may approach within a very few feet of

them while they are sitting. This allows of close observation being made. The bird is nearly as big as the common goose, and is pure white all over, excepting on the pinion feathers of the wings, which are black, and the neck, which is sandy gray. The male and female are precisely similar in appearance. The head is large, the bill long and pointed, and the mouth capable of opening wide enough to admit a man's foot; this may be proved by placing your foot close to the bird, but take care at the same time that your foot is strong and thick. The head of the solan goose is perfectly destitute of nostrils, no opening being visible where they usually occur in other birds; nor do the middle claw and beak become serrated till the young bird is able to fly—two strange facts in connection with this bird. The young do not arrive at their full plumage till the expiration of several years; the stages of colouring intervening—namely, black and piebald; neither do they pair until the adult plumage is attained.

The solan seldom utters a cry while on the wing, but just before lighting on her nest, she gives out a harsh guttural note, which is usually responded to by the neighbouring sitting birds; the responses, however, I suspect to be the result of jealousy, as they are accompanied by menacing gestures towards the newcomer. Again, when intruded upon, she utters her hoarse cry, resembling the words *kirra, kirra, or, or, cra*, and this cry is taken up by those nearest her. These are the only occasions I have heard the gannet's voice, excepting when two were quarrelling together.

Where so many birds are grouped together within such circumscribed limits, one would naturally suppose the noise to be terrific, and yet it is not so. The comparative freedom from noise is what has always struck me as being a very remarkable circumstance. A single roused kittiwake will, it is true, make more noise than a score of solan geese; but if these small fry are inclined to rest, the noises created by the other feathered tenants of the rock are not sufficient to drown ordinary conversation. I have even noticed certain intervals of almost total cessation, with hundreds of geese flying around at the time, but these must, of course, be rare. Geese breed all over the faces of the rock; kittiwakes usually at an elevation of about two-thirds of the entire height of the precipice; they, in fact, occupy a zone to themselves. The guillemot breeds at nearly a similar elevation with the kittiwake; and the razor-bill in holes in the fortification. The puffins, I believe, breed in deserted rabbit-holes, though I never saw any there. Besides these, a few pair of herring-gulls, black-backed gulls, and cormorants, breed upon the rock; the last frequenting the penetrals of the cave—which perforates the island like a tunnel—and emitting at times the most unearthly sounds, or rather howls. These unearthly sounds are rarely heard on any other portion of the Bass, and have always associated this gloomy cavern with feelings of mysterious awe. Boatmen have attributed these gloomy cries to the guillemot tribe, a few members of which do certainly frequent 'the cave'; but I am inclined rather to impute them to the cormorant, as I have never heard the voice of the guillemot, or 'marrat,' as the sailors call it, under any circumstances whatever, saving the low sharp crack emitted during their dying struggles after a gunshot. A solitary pair of eider-ducks may sometimes venture to rear their progeny of 'bratlocks' on the rocks; several pair of jackdaws; and a single pair of peregrine falcons: these, together with rock-pipits, rear up the species known to me; but there may, of course, be others which have escaped my observation. I heard a common wren from some long nettles close to the fortifications, and, by the same way in which she settled close by, waiting, doubtless, for my departure,

I inferred that she must have had her nest there; but I failed in finding it, though I searched diligently.

The Bass is let at a considerable sum annually by its owner, Sir Hew Dalrymple, to a person termed 'the keeper.' The rent is made up first and chiefly by the money obtained for the young geese, which, when cooked, are sold at from 6d. to 1s. apiece; and second, by the charge exacted from strangers for the privilege of visiting the rock. The number of young geese slaughtered annually is about two thousand; and these are first skinned, then soaked, and baked slowly, after which the greater number are packed and forwarded to various parts of Great Britain, while others are reserved for home-use. The young of the solan goose, when properly prepared, is a daintier morsel than many might suppose, especially when eaten cold; and I believe her Majesty has an annual treat of solan-geese eggs. These should be boiled for twenty minutes—the albumen coagulating merely to the consistency of jelly—and eaten with pepper, mustard, and vinegar; and for breakfast, I know of no greater dainty.

At three different times in the year do the cliff-men essay their dangerous task—1st, when the eggs of the kittiwake, &c., are ready for harrying; 2d, when the peregrine falcon's brood is fit to be carried off; and 3d, when the young geese are sufficiently matured for killing.

The eggs of the first are sought after by collectors, and are always kept in store at Canty Bay, ready blown, price 6d. A supply of the herring-gull, puffin, guillemot, and razor-bill or Tammie Norie's eggs, is also kept, though in much lesser quantity than the kittiwake's; and sometimes the eggs of the greater black-backed gull and cormorant may be had.

On the second descent, the cliff-man brings away the falcon's brood in a basket slung round his shoulder for the purpose. He is let down to the spot by means of a rope tied round his waist, and another loose in his hand; the rope is previously made fast round a rock, and further held by a man above. The cliff-man signals to his companion by the rope he holds in his hand, and so is let down, steadied, or hauled up at pleasure. Young peregrines require to be dexterously handled, or they may inflict severe wounds with their talons. When the cliff-man reaches the eyrie, they instantly begin to screech vociferously, far outvying in their piercing shrieks the cries of the other denizens of the cliff. They always turn upon their backs, and strike viciously with their feet, so that the operation of bearing them away used to be somewhat tedious. The men, however, now generally wear gloves, and are thus enabled to lift their screaming captives at once from the nest. The female falcon usually sails close by all the time, and often lights on a piece of rock at hand, a sorrowing spectator of the scene. This has been a blank year for falcons on the Bass.

On the third and last occasion of descents, which last from the middle of August till the middle of September, the cliff-man is let down three times a week by a rope round the waist, with a steadying or signaling rope in the left hand, and a stout cudgel in the right. From cliff to cliff he gropes his dangerous way, sometimes dangling in mid-air, and then regaining a footing. He knocks a young goose on the head, which kills it at a single blow; he then places the cudgel in his rope-hand, and seizing the dead bird, heaves it clear of the rocks into the sea. A boat is waiting below to gather the slain birds; and I may here remark, that it has to give them a wide berth, as one falling into it might stave it. The art of heaving the dead birds into the sea is one not learned all at once, as it requires both strength to pitch far enough *outwards*, and an eye accustomed to judge of distances at great elevations, to calculate

the necessary force to be employed. Sometimes the man is let down into the boat, and at other times he is hoisted up again by the rope; the whole proceeding, too, is considered most dangerous in wet weather, and is on that account rarely attempted except upon fine days. Accidents to cliff-men are very rare on the Bass.

I will now take leave of the Bass and its tenants, though I have not noticed the rabbits which abound on it, nor the sixteen sheep its somewhat scanty pasturage maintains. The view from the fortifications is truly magnificent, and of itself well repays the trouble of ascending thither. The associations connected with the ruinous cells and dungeons are deeply interesting; and the fair marks presented by two geese, which hold as their own two ledges of rock 180 yards from the fortifications, and are termed Baird's and Elcho's geese respectively, are amply sufficient to test the skill of the rifleman. These are considered legitimate targets by the keeper, who permits any amount of practice at them gratis; but five shillings a head is charged by him for old geese killed in cold blood; so, novice, beware, and when directing thine unerring rifle at either of the above solans, see that thou dost not riddle another instead!

MY FIRST PLAY.

WHEN first anything new happens to us, it is an event, not only for the time being, but for the future. Thoughts, feelings, and intelligences unknown before, spring up and give birth to others which never again seem to leave us, and which indirectly, but certainly, influence our future actions and sentiments, although we may not take the trouble of tracing to their sources the 'little things' which gave the first tiny tinge of colour to what forms our present and permanent bent of character. I had never seen a play of any kind, and had heard marvellously little about plays or scenic representations in general. To be sure, my nursery-maid, Mary, talked occasionally about the 'theater,' and had even told me a long story concerning one Jane Shore, and a wicked king, whose wickedness, I concluded, consisted in making the said Jane Shore cry water-cresses, as it was apropos to hearing that beautiful, melancholy, but now obsolete cry of 'Buy my water-cresses,' that she for the first time related the pathetic tale—assuring me that such was undoubtedly both the mode and the tune by which the lovely and unfortunate prototype of the dirty drabble-tailed drab then passing us, used to call the attention of the Londoners, two or three thousand years ago, to the fresh leaves she had been forced to gather for them, to eat with their bread and butter, early in the morning, at the cold brook-side, before the wicked tyrant himself, or the sun, or the birds were awake.

Mary, being somewhat romantically and sentimentally disposed, dealt chiefly in tragedies where ladies died for love of handsome young gentlemen, who stamped about and stabbed each other in measured time, which she practically demonstrated, by making a ferocious attack on a pillow with the poker; which pillow, after having performed the part of a rival lover, was rendered available in smothering *Desdemona*—that is, the unconscious cat, which never *would* lie quiet and allow itself to be killed as that exemplary wife did, but ran mewing and spitting under the bed. She was not, it must be confessed, particularly clear in her descriptions; and there was a strange jumble of kings and queens in crowns, poisoned cups, bloody daggers, gold waist-coats, purple and crimson robes, ermine and suits of armour, helmets, battle-axes, and clashing swords,

wailing, woe, death, and dismay, dancing in confusion through my childish brain, and filling me alternately with curiosity, terror, delight, and a strong desire to witness myself the wonders she dilated upon.

One Monday morning, when snow lay thick on the ground, frost in the very air of the house, I sat with purple nose and red fingers at the school-room piano, picking out a new music-lesson, my father unexpectedly entered—a very unusual event with him. He hoped I was a good girl; and then, in case my prim governess should insinuate anything to the disadvantage of my character, quickly added: 'We have secured a box on Thursday at Covent Garden, and mean to take you, Lilian, where I hope Miss Birch'—turning to the governess—'will also do us the favour to accompany us.' Whereupon Miss Birch's countenance, hitherto anything but smiling, brightened; she graciously signified her assent to the proposal, saying: 'I was a very good girl, and deserved indulgence.' Although this was in direct contradiction to the opinion she had expressed to myself some ten minutes before, I was not disposed to be critical, but jumped up in a fever of joy, kissed first my father, and then Miss Birch, my blood circulating so rapidly, that before the former had well closed the door, neither purple nose nor red fingers remained.

What was it to me now that the fire burnt low, or that the streets were covered with snow; was I not going to the play? I bustled through my lessons with unusual energy; and the moment the clock struck twelve, bounded off to the nursery, where my little sister Susan always stayed till she joined me at two to commence her lessons also. The joyful news had already been imparted there, and Susan was longing for my arrival to talk over our anticipated treat with Mary, who entered into our feelings most good-humouredly, but told us she did not think we should see *Jane Shore*, inasmuch as that was an entertainment of too lofty a nature to take children to; but she daresayed we should see 'harleyqueen and columbind'—more amusing, and better suited to our intelligence; and then she, nothing loath, tried to enlighten us in the same confused manner she had before attempted to describe her favourite tragedies; leaving our little minds in a tangled maze, which only still more whetted our curiosity. How Tuesday and Wednesday passed, it is equally impossible to recollect as imagine. Going to the play was ever present; and the time seemed so far off, we feared it never would come. Thursday, I remember, was a rapid thaw. I suppose it had begun before, for by the middle of the day, no snow was to be seen or frost felt; the sun shone on our anticipated treat; no lessons were thought of, for Miss Birch, who had her 'frock to trim,' most generously gave us a holiday. We were to dine late, and our parents early—all together! because we were going to the play, as we duly informed every person we saw, and to have a cup of *café à la crème*, to keep us awake; not that there was the slightest danger, we felt sure, of our ever wishing to sleep; but we wisely kept that conviction to ourselves, lest the *café* should be struck out as unnecessary.

Every one knows the particular rumble of his own carriage; that evening, however, we made several mistakes. 'There it is,' was said a dozen times before there it really was; but at last it did positively come, just at the very minute it was ordered, old John Gemmel, the coachman, knowing full well where we were going, and who was going. So jumping, bustling, laughing, squeezing each other's hands, and pinching our mamma's till she wisely bethought herself of elevating them out of our reach, we allowed our little white satin tippets, edged with swandown, to be tied on, smelling of cedar-drawers, lavender, and dried roses—a mixed odour which, when inhaled, even at

this day, restores to me the feelings of that happy hour. A happy hour it was; for

All things please when life itself is new.

Although it was yet the days of oil-lamps—never having been out in an evening before—to our unaccustomed eyes, the streets seemed brightly illuminated. The shops were one blaze of light; and we shouted with glee as we rolled on past mercers and milliners, perfumers and chemists, dazzling the eyes with a rapid succession of the brightest colours; grocers and green-grocers, with their shows of figs and chestnuts, almonds, raisins, apples, pears, and all sorts of good cheer; pastry-cooks' shops, resplendent with snow-capped twelfth-cakes; toy-shops, with dolls and drums and baby-houses, in every variety!—all looking twice as tempting as by day; but yet we pitied the poor people behind the counters and their customers, for they were evidently not going to the play. Much we wondered to see grown persons, who, of course, could always do just as they pleased, composedly walking away from the goal of our desires; and felt certain every one going in the right direction along the glistening pavement, wet with a recent shower, must be 'going to the play.' It seemed a long way off; and so many new sights and feelings were succeeding each other, that to us it appeared at least ten miles. At length, carriages increased; cries met our ears, of 'Bill of the play,' 'Oranges,' and so forth; link-boys flashed their torches; coachmen cut in and cut out, and lashed and swore—we stopped—we went on—we stopped again—we were come to the playhouse door at last! Lifted out by the footman, my father took my little sister by the hand, whilst I followed between my mother and Miss Birch. We now talked no more, and jumped no more, for a sort of overwhelming feeling of mixed joy and fear kept us still as we walked along the lobbies. The box-door suddenly opened; and the lights, 'the sea of heads' the uproar the gods were making at that particular moment, heard amidst the tuning of the orchestra, the cry of 'Music,' 'O. P.,' 'Turn him out,' 'Throw him over,' had such an effect upon my excited feelings, that I really think, for a moment, I lost consciousness. When I came to myself, I found we were all, except my father, seated in the front row, and the overture about to begin. Passionately fond of music, and knowing every popular air, of course this overture, where many were introduced, was a great treat, and one I had not counted upon. It was short; for at Christmas, children form the greatest part of the audience, and what is likely to please them is then more attended to than at other seasons.

I cannot now remember what the name of the piece first acted was; but although I knew it was male-believe, I still could not help fancying it real: the scenery was so like nature; for we saw it from the centre-boxes, which favour the illusion; only the ladies were almost too beautiful for flesh and blood, or anything but wax; however, they sang and danced in a haymaking scene, which, but for these beautiful voodoo-doll ladies, would have been just like the real country, as I had seen it at my uncle's the summer before, where clodhopping clowns and rosy-cheeked ragged rustics figured instead. And there were also warriors in plumed helmets, such as I read of in my story-books; but I could hear with difficulty so far off, and could not comprehend what the gentlemen ranted, and the ladies kept whining about. At last it came to an end; and although we entertained some fears that all was over, our patience was helped by an orange and a bun; and, after an overture, even prettier than the last, came the pantomime.

Ah, these were the palmy days of pantomime! Grimaldi was clown; Bologna, harlequin; and

Mrs Parker, who, though sixty, the age of my venerable grandmamma, looked as young and as blooming, and danced far better than any of the aforesaid haymakers—Mrs Parker, who never grew old, was columbine. Perhaps I confuse, perhaps I may be introducing parts of another pantomime, or perhaps there were three pieces played; but a live elephant and horses appeared on the stage in *Bluebeard*; and, along with my reminiscences of that tragedy, the cabbage-man is intimately connected. A pumpkin formed the head; a cabbage, the body; carrots, the arms; radishes, the fingers; rolls of Epping butter, the legs; and Dutch cheeses, the feet. Whilst I was wondering what Grimaldi could mean, after making his marketings, disguised as a farmer, and laying them together with such care, up jumped this vegetable man, and pursued him round the stage. Certainly a foreshadowing of Frankenstein; perhaps the origin of that remarkable book. Then harlequin entered an apothecary's shop, struck with his wand three large drug-bottles, and out jumped three little devils, with horns and tails, instead of the medicine they were supposed to contain. 'Nothing is new under the sun'; this was undoubtedly a homœopathic hint, whilst yet homœopathy was in embryo; but, I suppose, I must have been rather below par as to intelligence, for one of these poor little imps got hurt in some way, and emitted most doleful cries before he was extricated from his drug-bottle; and—in recording the fact, I almost awaken the feelings of shame of that moment—I, I alone, of all the immense audience, in that immense Covent Garden Theatre, laughed. I heard my own laugh; I saw every eye in our vicinity turn upon me, and then I understood it all, and felt myself a fool; for it was not 'part of the play,' as I, in my ignorant simplicity, thought. The unfortunate child was hurt and frightened both. How utterly miserable I felt is more than words can convey. I did not dare look up for long; but when at last I ventured to do so, to my great surprise, and greater relief, no one appeared to be aware of my existence; all eyes were directed towards the stage; so, with the happy *insouciance* of childhood, I soon forgot my humiliation; I was as much engrossed with the moving scene as before.

The greatest of pains and the greatest of pleasures come to an end some time or other, and although our kind parents, stifling their yawns, remained until the curtain fell, that we might see the whole, we both declared we should like it all to begin over again. Once in the carriage, however, nature resumed her sway, and we fell so fast asleep, that we were undressed and put to bed without awakening, and our slumbers were dreamless; but early next morning we were alive again, calling to each other from our little beds, humming the airs, singing the songs, acting the scenes we had witnessed the night before. For many successive nights, however, clowns and columbines, harlequins and helmeted heroes, chased each other through our midnight visions; and my imitation of Mrs Parker was so successful, that Monsieur Ricochet declared I must have practised in my sleep, so astonishingly had I improved since the preceding week. My sister attempted to read with the emphasis the actors recited, and although it must have been most intensely ludicrous, this new fancy certainly laid the foundation of a better style of reading than the unchanging sing-song she was before remarkable for. The happiness of this our first play did not terminate when the curtain fell, for even now, as I write the above description of what occurred so long, long ago, I seem to live it over again; the tunes start up in my mind, the perfume of my white satin tippet in my nose; for a moment, all the innocent imaginings of that period of life are mine once more; and not only mine, but my little daughter

and niece find the description so pleasant, that they have had it read over to them three times, which makes me hope it may meet with the approbation of other young readers of *Chambers*, and so I send it.

HOME TRAVEL.

Of all the affectations—and their name is Legion—with which Society encumbers itself, that of the fashionable necessity of 'going abroad' is perhaps the most inane. Society does not really like it, and would, if it dared, quite willingly stay upon this side the Channel. It gets so sea-sick in that short passage, so crushed as to its crinoline, so limp as to its shirt-collars, that it can be scarcely recognised as Society at all. It is annoyed by government officials to an extent that would at home have put it in revolution; it degrades itself by the driving of bargains against knavish foreigners, by whom, nevertheless, it is on all sides shamefully plundered; it endures the worst of food, the most acid of drinks, heat such as throws it into the vilest and most profuse perspirations, and filth, almost everywhere, unutterable, which it characteristically attempts to ignore. Society on its foreign travels is made to rise in the morning at about the same hour at which it retires to rest at home, is driven rapidly over infamous roads for many hours, staring at the surrounding objects as long as it can stare; it nods, yawns, quarrels with its fellow-travellers, grows faint with hunger, overeats itself on omelets and fruit, and goes to bed upon a sofa, with a pillow upon the top of it by way of coverlet: all this time it strives to admire with a perseverance which it never uses in Britain, and acquires by the total experience the fashion of underrating the beauties of its native land.

We do not speak of invalids, who among a new people, alien customs, and a more temperate climate, are seeking for health in change; of those who, after making themselves acquainted with the wonders of their own country, set out to extend the sphere of their observations in foreign lands; or of the genuine lovers of painting, architecture, or antiquities, the best examples of which they are naturally anxious to behold with their own eyes. We refer only to Society proper, which seeks in its summer exodus mere novelty and the beauties of nature; which last it makes a very great point of admiring—in the presence of those who have not visited the same localities. Alas! it is not alone fashionable folks who neglect the pleasures which lie close at hand, the flowers that grow within reach, for those further afield, to which distance has lent its charm; but certainly this weakness of theirs is especially obvious in the matter of 'going abroad.'

Why, within a few days' journey of Society's town-house—if Society did but know it—and on English land, there lie whole tracts of country as beautiful as soul can desire, as wild as brain can bear, and whole tribes of its own countrymen whose dialect would be as strange to its ears as Tyrolean or Swedish: mountains, whose summits eye cannot reach from below any more than it can Mont Blanc's; lakes, which yield in beauty to no inland waters even in gorgeous Italy, and which reflect a cloud-canopy such as the sheeny South can never behold; rivers, winding in slumbrous valleys so deep-hidden that one might think the water-gods still haunt them, and the old régime prevails; and, above all, such shores by the stormful sea—shattered crag, and sheerest steep, and silver-sanded bay—as all the coast-lines in the world cannot excel for glorious contrast.

But, as one never looks among our own relatives for any person of genius—except one's self—so it would seem that fashion had determined not to see anything new and fair at home. We thank Mr

Walter White and men like him, therefore, for putting in their protest against this blindness in a very effectual way—namely, by exploring their own beautiful country for themselves, and giving us an account of it in a manner which combines the liveliness of travelling adventure with the accuracy of a guide-book. Almost every summer, as it seems, this Londoner, who has walked to the Land's End, spends his one month of summer holiday in this or that English county, seeing it thoroughly, and taking copious notes of what he sees; the result of which is a new book 'tasting of Flora and the country green,' as surely as spring comes round. His volume for this year is *A Month in Yorkshire**—the same period which Society often allows itself for seeing Germany, Switzerland, the Tyrol, Italy, the south of France, and Spain—nor do those thirty days seem to have been at all too long a time for exploring that most interesting county.

Mr White seems to have met during that ramble individuals quite as singular and to the full as foreign, in dialect, manners, and occupation, as he would have come across had he taken the grand tour; while, in nature, he witnessed scarcely less variety of pastoral beauty and marine grandeur; scenes of history, and haunts of poet; romantic ruin, and wonders of modern engineering. He met too, we are sorry to add, some dwellers among all these striking scenes as careless of the beauties which lay around them as any double-refined worshipper of fashion itself. Two Yorkshiremen, whom he overtakes near Malham, are bent solely upon seeing there a certain horse which one of them has sent thither 'to grass' a few weeks previously.

'They were as much amused at my admiration of the scenery as I was at their taking so long a journey to look at a quadruped. They would not go out of their way to see Malham Cove, or Gordale Scar, not they; a horse was worth more than all the scenery. And yet, judging by their dress and general conversation, they were men in respectable circumstances. Presently, as we passed a rocky cone springing all yellow and gray from a bright green eminence, I stopped and tried to make them understand why it was admirable, pointing out its form, the contrasts of colour, and its relation to surrounding objects. "Well!" said one, "I never thought of that. It do make a difference when you look at it that way." Neither of them had ever been to London, and what pleased them most was to hear something about the great city. They were as full of wonder, and as ready to express it, as children; and not one of us found the way wearisome. . . .

"Eh! that's Maum Cove, is it?" he said, as a turn in the road shewed us the head of the valley—"that's what we've heard so much talk about. Well, it's a grand scar." He seemed to repent of even this morsel of admiration, and helped his neighbour with strong resolutions not to turn aside and look up at the cliff from its base. . . .

'Although Gordale Scar is not more than a mile from Malham, they refused to go and see it. However, when we came to the grazier's house, and they heard that the Scar lay in the way to the pasture where the horse was turned out, they thought they wouldn't mind taking a look, just, as they went. The good wife brought out bread, cheese, butter, and a jug of beer, and would have me sit down and partake with the others; regarding my plea that I was a stranger, and had just taken a drink, as worthless. A few minutes sufficed, and then her son accompanied us, for without him the horse would never be found. We followed a road running along the base of the precipitous hills which cross the head of the valley,

to a rustic tenement, dignified with the name of Gordale House; and there turned towards the cliffs by the side of a brook. At first, there is nothing to indicate your approach to anything extraordinary; you enter a great chasm, where the crags rise high and singularly rugged, sprinkled here and there with a small fir or graceful ash, where the bright green turf, sloping up into all the ins and outs of the dark-gray cliff, and the little brook babbling out towards the sunshine, between great masses of rock fallen from above, enliven the otherwise gloomy scene. You might fancy yourself in a great roofless cave; but ascending to the rear, you find an outlet, a sudden bend in the chasm—narrower, and more rocky and gloomy than the entrance. The cliffs rise higher and overhang fearfully above, appearing to meet indeed at the upper end; and there, from that grim crevice, rushes a waterfall. The water makes a bound, strikes the top of a rock, and rushing down on each side, forms an inverted A of splash and foam. And now you feel that Gordale Scar deserves all the admiration lavished upon it.

"Well!" exclaimed one of the Yorkshiremen, "who'd ha' thought to see anything like this? And we living all our life within twenty mile of it! 'Tis a wonderful place."

"So, you do believe, at last," I rejoined, "that scenery is worth looking at, as well as a horse?"

"That I do. I don't wonder now that you come all the way from London to see our hills."

O A S I S.

Thou camest hither with the crescent moon,
And now his light is scarcely on the wane;
Sad is it thou must go away so soon,
And not return again.

So very sweet a friendship has been knit,
So very brief its harvest-time has been!
Take heart! take heart! we may not think of it
As all in vain, I ween.

For as a traveller in desert lands
Rideth day after day from morn till night,
Weary with the hot sun and endless sands
And gleaming, hazy light;

With thick, incrustèd throat and parchèd tongue,
Straining his leathern bottle, hard and dry,
Gasping and faint and sickly borne along,
And wishing half to die,

Cometh at once upon a sudden well
And pleasant grass and little grove of palm,
Stoopeth delighted all his thirst to quell
With water cool and calm;

And is refreshed and goeth in its strength
Many days more across the desert waste,
And cometh to his journey's close at length,
In freshness and no haste;

So in the desert of this life for us
Friendship has made a cool and pleasant spot;
We shall go onward to the journey's close
With strength that faileth not.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 242.

SATURDAY, AUGUST 21, 1858.

PRICE 1½d.

LITERARY GHOULS.

A PROTEST FROM THE OTHER WORLD.

I AM a dead author.

What I wrote, or how, is unimportant now: I dwell 'in the land where all things are forgotten.' The reason why I am permitted 'again in complete steel'—both as to pen and heart—to reappear in the mundane sphere, through the medium of this *Journal*, will be obvious in the following communication. How communicated, by tapping, table-moving, or spirit-writing, befits not me to say, and is irrelevant to the subject under consideration. I will only solemnly attest that the sole devil which has had any hand in the matter is the printer's.

I am dead. For me, no more the delays of publishers, the stupidity or ill-nature of reviewers, the praise, blame, or curiosity of the public. Into 'the silent land' my works, whether 4to, 8vo, or 12mo, happily do not follow me; I shuffled them all off with this mortal coil; left them to take their chance of surviving me; and may their faults lie on them as gently as library dust!

For my dust, that also is a secondary consideration to me now; yet I have a kindly feeling for the relics of what often hampered me most terribly during life. Occasionally, I wander airily round a certain suburban cemetery, to take an amused observation of a certain elegant vase with a marble laurel-wreath at top, and underneath an inscription attesting my great literary merit, and the irreparable loss which I am to society.

Yet that inconsolable society is gradually ceasing to name me, even as 'Alas, poor Yorick!' and shortly I shall only be remembered by a faithful household or two as 'Our poor dear John.' I am not now ashamed of being 'John,' and should be well content to see on the aforesaid picturesque vase only that name and my surname, with the date of my birth and death—the sole facts of moment to me now—or perhaps some modern version of the familiar old epitaph:

Good friend, for Jesus' sake, forbear
To digg y^e dust enclosed here:
Blest be y^e man that spares these stones,
And curst be he that moves my bones.

Query, had Shakspeare any foreboding of, or did he mean any occult reference to, a certain race of literary ghouls, which, in later ages, delight in exhuming, not the bodies, but the souls of dead authors, who, unlike himself, are hapless enough to leave behind them any materials for biography? **Fortunate Will!** whose 'second-best bed,' left to thy wife

Anne, is the sole clue to thy matrimonial history—whose few scribbled signatures are thy only autographs extant—who tookest no steps whatever to make thy life known to posterity, but wast content to lie down and sleep by Avon side, leaving only that sacred dust, and a few unconsidered trifles of chiefly manuscript plays, which have made for thee an earthly immortality!

It was reserved for the resurrectionists of modern times to do worse than Shakspeare's curse deprecates—to dig up, not the bones, but the memories of the departed great; exposing them like mummies under a glass-case, sixpence a peep (namely, three vols. 8vo, charged twopence each for perusal; may be had at any circulating library). After which, all the critics in all the reviews and newspapers place them on a sort of intellectual dissecting-table, where they are lectured upon learnedly, and anatomised limb by limb, muscle by muscle—not at all out of mere curiosity, oh, dear no!—but simply for the good of science and the benefit of mankind. A proceeding vastly interesting and quite unobjectionable—except for any who may chance to find—as has been found—some near relative or beloved friend in the inanimate 'subject' of Surgeon's Hall.

I am incited to express myself thus, by being the elected spokesman of a committee of ghosts, who, in so far as spirits can suffer wrong, save from the sorrowful beholding of it, have been wronged in this fashion since they left the mortal sphere. Although to us, in our celestial Hades, all this clatter about us

No more disturbs our calm repose
Than summer evening's latest sigh
That shuts the rose;

still, we deem it right, for truth's sake, that a voice from the other world should convey *our* opinion on the matter.

We abide—where, it matters not; as space, like time, belongs only to the flesh. We are often drawn together, as congenial spirits are, in life and after; and we converse sometimes of earthly matters, which we are aware of; for to be spirit alone implies to *know*. How, or how much we know, I shall not explain, as you will all find it out for yourselves at no distant day. We rarely speak of our own books—we have said our say, and done with it—but we sometimes note the books that have been written upon us since our departure.

These are of every sort: from the humble one-volume *Remains*—compiled by some affectionate heart which deemed the loss as fatal for the world as for itself—to the large and boastful *Memoir* of somebody

who was never heard of till he became a biographee, solely, it would appear, for the glorification of his biographer: from the plain, honest *Life*, with nothing in it to chronicle except useful deeds, or scientific researches: and the pathetic *Final Memorials*, throwing light upon long-secret griefs and ended labours, down to the heaps of *Reminiscences*, *Recollections*, *Journals*, and *Correspondences*, piled up like a cairn over some unfortunate—of whom, after all, the utmost that can be said, is included in a verse by one—whose hint his biographer had much better have taken—

Once in the flight of ages past
There lived a man. And who was he?
Mortal, howe'er thy lot be cast,
That man resembled thee.

And all that need be told of him—which he has not told of himself, by writings or actions—the bard goes on to say—

Is this—There lived a man.

But these ghouls have no respect to the image of man, either spiritually or corporeally. They have dragged into the open daylight all our mental and physical defects; described minutely our personality, living, and in one or two instances, the appearance of our poor corpses after we were dead. Our vices, follies, sufferings, our family secrets and domestic wrongs, have been alike paraded before the world. Truths, half-truths, or two truths so put together as to form a whole falsehood, having been grubbed up in all directions, and either dovetailed into a groundwork purely imaginary, or arranged into a mosaic of most charming pattern—with the slight drawback that the design of it and of our history is entirely owing to our ingenious biographer.

All this harms us not; but we regard the matter as something sad and strange, which may be harmful to authors now living, who, one day, will in their turn become ghosts and biographical subjects.

Thus, suppose we, who most of us passed our sub-lunary existence like ordinary men and women, wrote our books and published them; but for ourselves courted peace, privacy, and the meditative life which all true authors love—suppose we had been aware that on us, defunct, a greedy biographer would seize—rake up all our doings, undoings, and misdoings; record how we dressed, and walked, and ate our dinners; jot down, in various incorrect forms, which we have no power to set right, every careless or foolish word we said, with our motive for saying it; lure from weak, faithless, or indifferent friends our most private letters, written, perhaps, as others beside the luckless *genus irritabile* do write letters, on the impulse of the moment, or under the influence of some accidental mood; call upon all our kindred and acquaintance—one half of whom knew little of us, and the other half never understood us at all—for every possible reminiscence concerning us. Alack, alack! had we suspected this, what a living death of apprehension, annoyance, and mistrust would have been ours! And for the result? We should either have doubted our nearest and dearest, and retired in disgust from the impertinent world, to leave our bones mouldering unmolested in some African desert or American cave; or we should have carefully arranged our whole life with a view to posthumous publication. We should never have made a remark without considering how it would look in Smith-iana. We should have combed our hair, tied our neckcloth, selected our gowns and gloves, strictly for the benefit of posterity. Our very ledgers, house-accounts, and washing-books, would have been penned with an eye to autographs. We should have eaten, drank, and slept, like flies under a tumbler-glass, waiting to be put in amber; or like strange beasts, conscious that their destiny is from the Zoological Gardens to the British Museum. Nay, those

of us whom a beneficent providence removed from the world before the development of the present biography mania, would have trembled lest even on the slender data attainable concerning them, some literary Professor Owen might put them together, and lecture on them in the character of extinct animals.

This last case is the least reprehensible. When his own generation has died out, and no living being can be wounded by any revelations concerning him; when an after-age has decided his permanent position in letters, and become at once less prejudiced, and more just with regard to both his faults and his virtues—then the world has some right to know the main facts of an author's personal history; at least so far as to discover whether his life corresponded with his works, which makes the works themselves doubly valuable. But that one whose whole or chief intercourse with the public has been by the pen—who has never put himself forward as soldier, politician, or desired any of those positions which necessarily make a man public property, should be seized upon as such, the minute the breath leaves him, for the entertainment of the world—is a proceeding the justice of which is certainly debatable.

On the other hand, let us suppose a case in which the writings are the one valuable residuum of a very worthless life, during which the unhappy author has

Known the right, and yet the wrong pursued;

wherein, from weakness, wickedness, or folly, his career as a man furnishes no possible example to posterity, except to wonder how he ever could have written as beautifully as he did.

Take, for instance, Hermon, whose worldly name, did I give it, would be recognised as one for years incensed with most odorous idolatry. What was Hermon? A wild, handsome young aristocrat, stuffed full with that passionate egotism and inordinate love of approbation which is the bane of many second-rate, of a few even first-rate geniuses. Consequently obnoxious to most men—though, because they only beheld the fair side of his character, adored by numerous women; till, whipped on one cheek, and caressed on the other, and maddened within by all the temptations of the world, the flesh, and the devil—this poet, this demigod, who lived not long enough to know himself a fool, ay, and somewhat of a wretch to boot, was found out after his death to be both.

And how? Because there was no one to say: 'He is dead, he shall be buried; buried altogether, leaving to posterity only the best and noblest part of himself—his writings.' Therefore, over his corpse biographers began to swarm like flies. A fashionable friend, for fear of other fashionable friends, suppressing his autobiography, which the man himself had carefully written, and which might have had one value—truth—puts forth a garbled *Life*. A sentimental, kindly, shallow lady-acquaintance details his *Conversations*; other acquaintance, denominated 'friends'—but he could not have had one real friend in the world, this wretched Hermon, who loved only himself—they too, in successive years, throng the press, dilating on his private history and manner of life—how he starved for fear of obesity, how he wrote noble poetry at nights, and talked slang and ribaldry by day; how the worshipped bard of half the century was, in reality, when you came to be intimate with him, a selfish, conceited, parsimonious, narrow-minded, vacillating, irritable fop.

Which, in degree, he was, and yet a poet; for poets are but men; yet was it for the friends, on pretence of elevating his memory, to hang up this poor battered scarecrow of humanity on a kind of glorified gibbet for every crow to peck at, and every passer-by to shudder or sneer? And will their doing so

advantage any human being? Will it not, in those who have not attained the large vision of us immortals, create a belief that all poets must be weak, puppyish, egotistical, because this undoubtedly great poet was so? Will they not be led to think that poetry itself must be a beautiful lie, because a man could sit in the quiet dead of night, writing out of the inmost depths of his nature his best, truest self, things worthy of it and him—yet rise up next day, put on his weak, foul, conceited self, and persuade shortsighted people that that was the real Hermion after all? Alas! that for this man, who, like many another man, was tormented with two warring natures in his heart—there was no influence strong enough to make him

Throw away the worse half of it,
And live the purer with the other half.

And so he died; and a fine carrion-feast has he made for biographers ever since.

So has his contemporary, who, among us ghosts, strangely surprised to find himself immortal,

Came wandering by,
A shadow like an angel, with bright hair
Dabbled in blood—

and salt sea-brine.

A sapient journal, whose comments on us departed often amuse us mightily in the upper sphere, asserts, noticing the last of the numerous memorials of Spiridion, 'that it supplies reasons why a complete life of him never can be, perhaps never ought to be, written.'

I put it to the conscience of mortals, whether 'a complete life' of any human being can be written, except by the pen of the recording angel?

If it be so difficult for a biographer to get at the simplest, most patent facts in his author's career, how shall he discover the life in full, inner and outer, and paint it clearly, honestly, capably—cramped by no prejudices, hesitating at no revelations, both able and willing to shew forth undisguisedly the whole man? How, even if he wished, can he do this, unless he were the man's *alter ego*, sufficiently understanding all his peculiarities to place his character in its true light before the world?

And was there ever, in his lifetime, any *alter ego* who thus thoroughly understood Spiridion?

Unaccountable as it may be, it is no less true, that most poets are all their days more or less children, and want taking care of like children. The *mens divinator* seems to unfit them partially for the hard necessities of life, unless, as is sometimes—would it were oftener!—the case, their moral conscientiousness is strong enough to force them to acquire qualities not innate or coexistent with what is termed 'the poetic temperament'—namely, prudence, forethought, common-sense; that solid wisdom which, in the sum of life, outweighs all genius.

This, Spiridion never had. How the busy world, deep in counter and merchandise, houses and lands, thrusts its hands into its pockets, and laughs over the picture of the beardless youth and his baby-wife, running from place to place, intending at each charming spot to stay 'for ever.' How afterwards, when he had broken laws, creeds, and women's hearts, it turns disgusted from the poor poet—living contentedly a life as idle and fickle as that of a meadow butterfly; yet, with one or two sad exceptions, almost as harmless. Utterly incomprehensible, to any respectable gentleman coming home at six p.m. precisely to his three courses, is the portrait drawn of our Spiridion, standing reading a whole day long with his untasted cold meat beside him—then starting, with a girlish blush: 'Bless me, I must have forgotten my dinner!'

And worse than incomprehensible—altogether hateful, and anathema maranatha—is the daring blasphemy

of indignant youth, when, blindly confounding the Christianity of a formalist and semi-rotten Church with the Christianity of the Lord Jesus, he dubbed himself atheist, to shew his abhorrence of both. Poor Spiridion!—yet any one studying his life, which, with all its faults, was so pure, unselfish, generous—so essentially the Christlike life of love—making even his enemies love him as soon as they came to know him—cannot but acknowledge that many a saintly bishop has been, practically, less of a Christian than he.

But why write his life at all? Why expose the miserable arcana of a luckless marriage—a disorderly home?—which many a man has to suffer, though he is fortunately not written about. Why unfold every writhing of the diseased restlessness and melancholy, that constitute a phase of mental development, which almost every sensitive nature is doomed to pass through during youth; until the fevers and despairs gradually wear themselves out, and the individual looks back on his old self—which, having happily been outlived, has never been chronicled—with a curious mixture of wonder and pity, that makes him tolerant and hopeful for all others going through the same ordeal. But, in the midst of those red-hot plough-shares, Spiridion died.

Yet understand us. We ghosts do not wish to lay an embargo on all biographies: thereby annihilating the natural wish of the human heart to be remembered after death a little, and causing the worth and beauty of good men's histories to be indeed

Interred with their bones.

Not so. Everything that is great and noble, virtuous and heroic in any author's life—in the life of any man or woman—by all means, after a decent time has elapsed, let it be faithfully related, for the comfort, instruction, and example of later generations. The world has a right to hear and exact such chronicles of its generations gone by.

But let us be chronicled not as authors, because we have written a book or so worth reading, but because we have lived a life worth remembering—the story of which will have a beneficial influence on lives yet to come. If any incense poured upon or saintly odours arising from our mortal dust can reach and delight us in our immortality, it must be thus to know that neither our doings nor our sufferings have been altogether in vain. And for all that concerning us was purely personal, in noways differing from the rest of our species—which can neither 'point a moral' nor 'adorn a tale,' but only minister to an idle and prurient curiosity—in charity's name, let it be buried with us.

Here, in this abode of calm, where the strongest puff of fame cannot send a single ripple across the sea of eternity, we ghosts wish it were better understood, that, however great our writings, we ourselves were but human, and no more was to be expected of us than struggling humanity can achieve; that our genius was an accidental quality, in noways exempting us from the temptations, any more than exonerating us from the duties, of our kind; that, if we erred, it was not our genius, but our miserable human nature that overcame us, as it does other men. We claim for our memories neither more nor less than the immunities granted to others—not authors—namely, that, except for some great benefit to the human race, you have no more right to drag a man's history, fair or foul, out of the merciful shadows of the tomb, than you have to dig up and sell his dead body, to be exhibited in a penny peep-show at Bartholomew Fair. The true manner of dealing with the dead at all times Shakespeare seems to indicate when he makes Queen Katherine say of Wolsey:

Yet thus far, Griffiths, give me leave to speak him,
And yet with charity.

She would not criticise her bitterest enemy, after he was no more, without the apology, 'Give me leave.' It would be well if some biographers I could name had been as tender and womanly.

And this brings me to speak a word on the part of some gentle ghosts among us, who, inasmuch as women naturally shrink from publicity more than men, have been the more sorely aggrieved. I refer not to those who, conscious of living always in the public eye, designedly left their *Diaries*, &c., behind them, elegantly and artistically arranged—a little *couleur de rose* may be—on the principle that

One would not look quite frightful when one's dead,

but still vastly amusing; and no doubt an appreciative public made itself very merry over these dead women, whose life was a perpetual *posse plastique*, and who took care to die in the most graceful of attitudes. They have had their desire; though every one of them may be wise enough to be ashamed of it now.

But for others who lived naturally, painfully, finding the burden of existence quits hard enough of itself, without taking heed as to how it would appear as a picture for future biographers—who arranged no materials, kept no intentional records, and evidently had not the slightest notion of ever being made into a book—the case is widely different.

The generality of female authors do not desire, living or dead, to be made into a public spectacle. Something in womanhood instinctively revolts from it—as it would from caressing its dearest friends at a railway station, or performing its toilet in the open air. Women's domestic ways, actions, and emotions are so much more demonstrative, and, at the same time, more reticent than men's, that to tear the veil from their lives seems a far more cruel wrong.

And in many instances even to do it, is most difficult. The true key to feminine nature is so delicate, so hidden, that it is all but impossible to find it. Thus, in nearly all female biographies current of later years, we feel by instinct that not one half of the life is unfolded—that much which would reconcile jarring mysteries, and harmonise the whole, has either never been discovered, or if discovered, is necessarily suppressed. Whether or not it be so with men—there probably never is written an absolutely true life of any woman; for the simple reason, that the intricacies of female nature are incomprehensible except to a woman; and any biographer of real womanly feeling, if even she found them out, would never dream of publishing them.

Take, for example, one of the most touching memoirs of modern times—the subject of which was a shy, timid, suffering being, utterly unknown, except through her books, until she died. Death—waiting but for the crowning of a long and life with one drop of happiness—took her suddenly away in the prime of her years. Now, the public thirsts with curiosity about her; now publishers foresee that any fragment concerning her is sure to sell; now her few friends and fewer acquaintances discover that they had entertained an angel unawares, and eagerly rack their memories for all possible memorials of her.

So, a life is written—carefully, delicately, and honestly, with due regard to the feelings of the living and the cherished memory of the dead; written as tenderly and wisely as such a life could possibly have been written; but—it ought never to have been written at all. For what is the result of it?

A creature, so reserved by nature that the ordinary attention of society to a 'celebrated author' was abhorrent to her, making her shrink with actual pain, is, after death, exposed openly to the world; her innermost thoughts, words, and actions displayed; her letters, written in the anguish of religious doubt, or family affliction, or intolerable bodily pain, printed and

published, for the amusement of every careless or sarcastic eye; her books analysed, in order to appertain fictitious characters among real originals, and try to extract from the imagination the history of the heart. Every misfortune, error, and disgrace of her kindred, which you feel sure the woman herself would have concealed to the last extremity of sacred endurance, is trumpeted out to a harsh, cynical, or indifferent world—of which the tender-hearted portion can but feel instinctively one emotion: 'For charity's sake—for the dead woman's sake—leave the whole history untold. Cover it up! let her name and her books live, but let her life and its sorrows be heard of no more.'

For, after all, what moral is gained from it?—a chronicle so sad, so incomplete, that apparently it does not 'justify the ways of God to man.' To mortals, on whom its page closed with that last piteous sigh of hers—'Am I going to die, when we have been so happy?'—it can administer no possible lesson except of tacit, hopeless endurance. Many similar lives there are—of which we on the other side the grave are alone permitted to see the blinding up of the broken web—the solution of all dark mysteries in the clear light of eternity: but such lives ought never to be written. It is impossible that any human being can write them, fairly and fully; and to attempt doing so incompletely, is profanity towards ghosts and men, as well as towards the Father of both.

'I would not have used any living creature's name of my dear friends have used me,' said, in the soft utterance of the unknown world, this gentle ghost of whom I am speaking; 'I would not, even had my correspondent been so foolish as to put her heart in her letters, have after her death put it also into print. I would have done with all her intimate correspondence as a friend of mine, estranged, yet soon to be regained—is wise and tender enough to do with hers—burned it. All the publishers and public in the wall hammering at my doors should never have torn my friend's secrets out of my heart. I would have had all things done for her, dead, exactly as would have been done by her, living. Not one breath of the idle curiosity which she hated during life, should have been allowed to expend itself over her tomb. But it harms not me,' said the silver voice, speaking calmly, as if of another person—and breaking up the circle from which, I, the appointed deponent, give this communication. 'My body sleeps in peace among my moorlands, and I live here—and in the one true heart that loved me.'

And then—as one of your poets, still in the land, tries to describe, painting the world which he knew not yet, but shall know—

Her face
Glowed as I looked at her.
She looked her lips—she left me where I stand
'Glory to God,' she sang, and passed the
Thridding the sombre bookings of the veal
Towards the morning-star.

[We print the foregoing article—to say nothing of our esteem for the accomplished author—on account of its suggestiveness, and the germ of truth it contains; but we would not be supposed to endorse its opinions in their whole extent. To do so would be to condemn utterly a popular and important department of literature, to cut off the sources of biography and history, and bury in the grave the materials that in the hands of the skilful are used for developing the scenes of human nature. Authors do not belong less to the world than kings; their influence is more extensive and more lasting, and they are entitled to so immunity from the interest or curiosity of men. Our inquiries into their lives may, of course, sometimes involve mistakes, or give currency to calumnies, but that is all the more reason why inquiry should not

rest. In the end, it will be successful where success is of any general importance; and the individual risk, or the possible delay, should not be grudged by those fine spirits that address themselves to mankind. At anyrate, whatever errors may arise, whatever private feelings may be outraged, whatever eloquent remonstrances may be published, the thing will still go on, for it depends on a principle in human nature: our Boswells will still be read with a luxurious feeling of enjoyment and admiration, and our Gaskells will still command our interest and our tears.—*Ed. C. J.*]

THE MAN OF TWO SHADOWS.

STRANGE and fantastical superstitions are confined to no part of the world; they flourish within the tropics, they locate themselves in the arctic and antarctic circles, and they are perfectly familiar to all the inhabitants of the temperate zone. If, however, they have any favourites residence, it is assuredly in Africa, where, from time immemorial, they have reigned paramount over all classes of the population. In other parts of the world, especially where men affect to be civilised, they who have enjoyed the advantages of education laugh when they meet together at everything denominated superstitious; but when they lay aside their multitudinous existence, become individuals again, walk home along tree-arched lanes, traverse midnight churchyards, and retire to bed alone, by one dim rushlight, in a room high up in some ancient building, rocked and shaken by the all-haunting winds, they often glide back into timorous infancy, and shiver as they pull the sheets over their faces.

This I say by way of apology for the two unphilosophical individuals who figure in the adventure described in the following narrative. They belong to a tribe of Arabs who encamped many years ago on the banks of the Upper Nile. The country in the whole neighbourhood is almost beyond imagination wild. Rocks naked, splintered, and precipitous rise on one side of the river to a great height, and are penetrated here and there by gorges so narrow and tortuous, that in some places the sun's rays never, during the whole day, illuminate their depths. On the stream's other bank, golden sand in billowy eminences stretches away interminably. Close to the water on both sides there is a strip of vegetation green as a pre-Raphaelite picture, and broken and diversified with singular beauty. On one particular point, the Libyan bank projects a little into the stream; and as you stand on this projection about the middle of the afternoon, and look directly southward, your eye catches a glimpse of a landscape which you have some difficulty in persuading yourself belongs to this world. Through a gap in the mountains, which appears much narrower than it is, since it permits the passage of the vast Nile, you behold a valley warm with sunlight, beautified with a broad expanse of water, looking like a fairy lake with patches of green-sward, here flat, there sloping and undulating, dotted with copses of mimosas, tamarisks, henna, rhododendrons, silk-trees, palma christi, and an abundance of nameless flowering shrubs; and overhead, the majestic date-palm fluttering its long leaves as a tall maiden flutters her veil in the soft breeze. Here and there, cresting small eminences, the airy cupolas of the tombs of holy men are seen between the foliage; and the whole stands relieved, like a landscape on canvas, against a chain of rose-coloured mountains, throwing up confusedly their jagged pinnacles into the blue.

The Arabs from the desert never encamp in the cultivated country, but on the sandy edge close to it. At the time I speak of, the tents were many, and

stood pitched in an immense semicircle facing the east, and projecting its horns on either side to the very verge of the palm-groves. The chief of this encampment—a man with green turban, to mark his descent from the Prophet—had a daughter named Selima (I wish the Arabs had more variety in their names); and among the youth of the tribe there was one who rejoiced in the name of Ibn Saffar. It was the misfortune of this young man that he had no relatives. How he found his way into the tribe, the chief only knew, if, indeed, he did. Yet Ibn Saffar was generally respected, because, as some believed, he was descended from the people of the Jinn, or, as others thought, came far away from Persia, where—in the mountains especially—there are people with blue eyes, and hair of the colour of gold. This was Ibn Saffar's case; and instead of shaving his head like the children of the Arabs, he suffered his long locks to escape from beneath a light embroidered cap, and to descend in waving masses over his shoulders. Abou Bernak, the chief, though friendly towards this young man—who possessed neither sheep nor camels, but went forth with his spear into the desert, where he hunted lions and hyenas, and often came back laden with their skins to the camp—was still very anxious that no intimacy should grow up between him and his daughter Selima. For this he had doubtless his own reasons; but the girl had eyes, and looked with admiration on the beauty of Ibn Saffar. It is true he was not gentle. His fierce eyes flashed habitually with an expression of cruelty; his short upper lip curled with disdain; and he appeared to be always eager to engage in conflict. Yet, as often as he came into the presence of the daughter of Abou Bernak, all his fierceness forsook him, and he sat at her feet as gentle as a gazelle. All his countenance wore a serene aspect, and his eyes were tinted like the light of the evening-star. He talked to her often of regions lying beyond the Bahr el Kolzun and the Shat el Arab, where the mountains are clothed with trees, where bright rivers rush down impetuously from the rocks, and where the believers in El Islam inhabit magnificent cities like those which the unbelievers of old times have left in ruins on the banks of the Lower Nile. Selima's imagination was inflamed by these accounts; so that she often wished to take a fleet dromedary and journey towards the rising sun, either alone or in company with Ibn Saffar, whom she loved with a trembling love, because he seemed to her a man of another race, of other beliefs and other feelings, who sympathised with nothing in the valley but her.

Often and often as they sat together, Ibn Saffar's face appeared to be transfigured, but whether by good or evil emotions, she could not tell. Some violent struggle appeared to be going on in his mind. Paleness, accompanied by big drops of sweat, came over him; his eyelids drooped, and his whole figure appeared to be bent with premature old age. Then, the fit being over, his face flushed, his eyes grew doubly bright, and tears as of rapture stood in them. These appearances, however, were painful as they were mysterious to Selima; but she feared to question him respecting them, for there was a loftiness in his manner, and a tone of authority in his voice, which entirely overawed her.

Once in the broad daylight, when the sun was a full hour from the summit of the arch of noon, they walked together to the banks of the river. Why did Selima start? why did she seize Ibn Saffar's arm? why did she look so fearfully into his face? why did her own become so deadly pale? why did her limbs tremble, and almost refuse to support her weight? There, high up on the bank, was the cause.

'Look at it!' she exclaimed to Ibn Saffar; 'we are haunted, or the place is haunted. See, there are two

shadows, which appear like mine and yours, moving high up there upon the bank! They must proceed from individuals moving invisibly above our heads. Oh, Ibn Saffar, explain to me this mystery, for you belong to the people of the Jinn, and there is nothing that is hidden from you!

For a moment the young man could make no reply; but the expression of his countenance was terrible, and he appeared to be labouring to suppress some emotion too violent to be described by words.

'Who has whispered to you, Selima,' he at length inquired, with as much calmness as he could command, 'the falsehood that I belong to the people of the Jinn?'

'I know not,' answered the maiden; 'but I have heard among the women of the tribe many things respecting you; and among others, the suspicion that you are not one of the descendants of Adam.'

'Selima,' he said, 'you are not sincere with me. It is Abou Bernak, it is your father who has poured this calumny like poison into your mind.'

'You wrong my father,' exclaimed Selima, the spirit of the Arabs rising in her breast—'you wrong my father. He is incapable of calumny, as he is incapable of everything base. The blood of the Prophet is in his veins, and in my veins, too, Ibn Saffar. No man, therefore, shall speak to me of anything like falsehood in the chief of my house; and if you have no connection with Afreet, or the people of the Jinn, explain to me why we are haunted, and why yonder shadows pursue us, and hover over us, while our own rest here beside us on the sunny bank.'

'Is it for me,' inquired her lover, 'to explain the mysteries of the creation of God? I am agitated, like you, by those shadows; but I do not say to you, Selima, account for that appearance, or I would suspect you of being an Afreet or a Jinneyet. If the place is haunted, let us meet here no more; there are other walks as beautiful, and the majestic Nile flows to the north and to the south, and we can come down to it anywhere, and speak together, and be happy.'

'Nay,' answered Selima, 'I will meet you nowhere but here, and you must tell me why we are followed by shadows other than our own.'

'I cannot,' answered Ibn Saffar.

'It must be so,' observed Selima moodily. 'I am disturbed by the fear that you belong to the people of the Jinn, and I swear to you by the Prophet!—'

Ibn Saffar put his hand on her mouth. 'Do not swear, Selima, I conjure you! I am not acquainted with the secrets of God.'

Selima retreated a step or two, and then said: 'I swear by the Prophet I will never be your wife until you explain to me the mystery of the two shadows.'

They then separated, Selima to her father's tent, and Ibn Saffar to wander in the desert. They met no more for many days, because Selima avoided her lover, whom she began to regard with superstitious dread. Meanwhile, he was plunged in deep affliction, because he loved her with unbounded love, and would have sacrificed his life to render her happy. He therefore took an instrument of music, and went at the fall of night to the river's side, and, sitting down among the rocks, sang to himself a melancholy song, while his tears fell on the instrument as he touched its strings. He compared his life to the mists which hang upon the mountains of Kurdistan, which are touched and rendered beautiful by the sun's first rays, but speedily melt and disappear, and leave no trace of their existence on the blue ether—to a fountain which springs up in the desert, and bubbles and sparkles for a while in the morning light, but is overwhelmed by the first sand-storm, and concealed from mankind for ever—to a shooting-star which emerges from the depths of the sky, and describes a bright track through the heavens, but, just as it begins to attract the gaze

of men, is extinguished by the breath of Eblis, and forgotten by all beholders. The moon had risen as he sang. Presently, he laid aside his instrument and smote upon his breast, and said aloud:

'Woe is me—the light that had begun to dawn upon my soul is changed into darkness. The daughter of Abou Bernak is devoured by suspicions, and hath ceased to love me. Verily the days of my exile are drawing towards a close and I shall return whence I came, unloved and unblessed. What then? It is written, and I must be numbered among those who are unfortunate.'

'Nay, Ibn Saffar,' murmured a sweet voice beside him; 'you accuse me unjustly. God is my witness, I love you like my own soul, but fears, the nature of which I need not speak of, oppress and overwhelm me.'

The young man arose and bowed before her, and said:

'This is the action of one whose nature is beneficent. Let us walk together along the river.'

'Yes,' she replied, 'let us go to our own place of meeting. It may be there will be no shadows there to-night; the moon is at the full, and floods the whole earth with beauty.'

They repaired to their favourite walk; but Selima's eye, instead of resting as it was wont on the face of her lover, sought among the shrubs, and the grass, and the sands, the fearful shadows which were never absent from her mind. Did her eyes deceive her? No! there they were, fainter, more indefinite, and indistinct; but yet, there they were, moving as they moved, standing still when they stopped, mimicking all their gestures, and appearing to put on every moment a more threatening aspect! What was to be done? Selima's soul was petrified with terror, and Ibn Saffar in the greatest perplexity found no words in which to express his affliction and astonishment.

'Verily,' he said, 'two individuals from among the people of the Jinn are walking over our heads, trading invisibly the soft air, but casting shadows nevertheless, which prove them to be solid substances, which the rays of neither sun nor moon can pass through.'

Selima made no reply, but gazing with strong apprehension at her lover for a few moments, darted away towards the encampment, leaving him in doubt whether he should quit the valley for ever, or bury his sorrows in the mighty river before him. By degrees, wiser thoughts came over his mind. He pondered on his situation, on the causes which had brought him thither, on Selima's character and on his own. It has been said by travellers that there is a mystic music in the Nile, which, as you sit and listen to it, enters your soul, and diffuses its own tranquillity over your whole mind. There may, in fact, be a supernatural power in that ancient and half-fabulous stream. It rises no one knows where, it is augmented no one knows how, it flows through deserts without fertilising them, through a land of its own creation, without apparently losing a particle of its volume, and as it descends with soft murmurs towards the sea, it appears to be conscious that it bears the primitive legends of a whole continent on its surface.

Ibn Saffar gazed at it with feelings little suited to a believer in El Islam. It is one of the properties of the Nile to act irresistibly upon the imaginations of those who behold it, and to infuse into them something like the superstition of the ancient mummy-makers. Ibn Saffar was young, with a fervid fancy, and fierce, ungovernable passions; wild projects thronged his brain; he formed and rejected many resolutions, and his thoughts were fast driving him towards a desperate, and perhaps disastrous enterprise, when he beheld a dervish approaching him from the south.

'Verily, O dervish,' exclaimed the young man,

'you are come to deliver me from extreme perplexity. I will relate to you my adventures, and describe to you my case, and the wisdom you have acquired by walking to and fro over the earth, will enable you to dispel the doubts and suspicions of one who is dear to me.'

The dervis seated himself upon a stone and replied: 'Say on, my son; I am attentive.'

The lover then related all that had befallen him among the tribes of the Arabs, and the relation in which he stood towards the daughter of Abou Bernak.

'Young man,' observed the dervis, 'you have not laid before me the whole truth.'

'I have told you all that bears upon the present matter.'

'You are mistaken. It is of consequence to know what happened in Diarbekir before you fled from your father's house; it is of still greater consequence to know what account you have given of yourself to Abou Bernak and his daughter; it is of yet greater moment to ascertain whether an attachment to the creed of the Suffis qualifies you to become the husband of a Sooni maiden.'

Ibn Saffar stood abashed before the dervis; his tongue clung to the roof of his mouth; his heart, which had never yet quailed in the presence of man, sank as he cast his eyes upon the earth, and he was sorely troubled.

'What I have said,' observed the dervis, 'was only designed to reprove you for your half-confidence. Had you been frank, I also should have been frank. I will be so now. Know, then, that I too am a Suffi; but what I must do in this matter must depend upon an interview which I shall have this night with Abou Bernak.'

Ibn Saffar turned his eyes fiercely on the holy man. 'Do you then intend'—

'If I interrupt you,' observed the dervis mildly, 'it is only to give you the assurance that I will do what is best. Now lead the way to the encampment, and, please God, we shall see what will happen to-morrow.'

Exactly an hour before noon on the following day, Selima stood with Ibn Saffar and the dervis in the middle of the favourite walk on the banks of the Nile. She perceived that the number of the shadows had been multiplied.

'Take this clod,' said the dervis, addressing himself to Selima, 'and cast it into the river, exactly in the spot from which the sun's image is reflected.'

She did so, and large ripples arose and moved in circles on all sides, and the sun's disk disappeared on the mirror of the waters.

'Now turn round, daughter,' he said.

She turned round and looked, and behold, their own shadows fell beside them upon the pathway, but there were no others.

'Praise be to Allah!' exclaimed Ibn Saffar, 'the people of the Jinn are put to flight.'

'Bismillah!' murmured Selima, 'it is as you say, O beloved of my soul.'

'Wait a while,' observed the dervis.

They waited. The waters of the Nile again became tranquil, and brilliant along their surface as polished steel. The glowing disk of the sun again became glassed in the stream, and sending up rays almost as bright as those which streamed from the burning orb in the sky, threw high upon the bank shadows almost as opaque and definite as those produced by the sun itself.

'You see, daughter,' observed the dervis, 'what has occasioned your perplexity. You stand, as it were, between two suns, one below, another above, and their beams falling upon you produce the pheno-

'Blessed be God!' exclaimed Selima, 'who has made such wonders and marvels upon the earth; and bless you, my father, since your wisdom has removed an obstacle'—

With the modesty of an Arab maiden, she left the sentence unfinished. Ibn Saffar completed it.

'Yes, O dervis,' he said, 'you have indeed removed an obstacle to the union and happiness of two hearts, which nothing on earth shall keep asunder. Selima is mine; and with this broadsword,' he added, drawing his scimitar, 'I will vindicate my right to her against the whole world.'

'Be content,' said the dervis. 'Abou Bernak will not refuse her to you when he knows'—

'But he shall give her to me, O dervis, before he knows anything but that I love her, and will have her, though all the tribes of the Mualims should say nay.'

They returned to the camp, where Abou Bernak, upon hearing all that had happened, consented, without any explanation, to bestow his daughter upon Ibn Saffar, who then acknowledged he was a prince of the Persians, who, returning after a while to his own country, distinguished himself in battle, and, under the name of Ahmed Shah, founded the Durani empire.

In his harem, when, in the evening, he sat down upon the carpet of repose with Selima, he took the very instrument upon which he had played among the rocks of the Upper Nile, and laughed and joked about the people of the Jinn and 'the Man of Two Shadows.'

THE HAIR-HARVEST.

PHYSIOLOGICALLY considered, there appears to be no essential difference between the hair and the skin, between the skin and horn, between horn and scales, and between scales and feathers; all five are mere modifications of the same thing. Hence, the most charming of our lady-readers, when she disentangles her luxuriant tresses with a comb, is acting on the same chemically composed material with the same chemically composed instrument as the bird when he sets right some erring feather with his beak. Anatomically viewed, again, the hair is made up of a vast number of horny laminae filled with a pigment which shews through its cortical integument in the same manner as it does through the epidermis of a negro. The bulb or root of the hair rests upon a reticulated bed of capillary vessels, into which the colouring matter passes directly from the blood, while the horny matter is secreted by the capillaries themselves. This colouring matter has been analysed by Liebig, from whose researches it would appear that it is to an excess of carbon and a deficiency of sulphur and oxygen on the one hand, and to a deficiency of carbon and an excess of sulphur and oxygen on the other, that the blue-black locks of the North American squaw, and the beautiful golden tresses of the Saxon girl respectively owe their jetty aspect and their brightness. An oxide of iron has also been traced by Vauquelin in the pigment-cells of the dark-haired races.

The astounding labour of counting the number of hairs in heads of four different colours—blond, brown, black, and red—has been successfully performed by another German *savant*, who thus tabularises the results: blond, 140,400; brown, 109,440; black, 102,962; red, 88,740. The scalps he found to be pretty nearly equal in weight; and the deficiency in the number of hairs in the brown, the black, and the red heads to be fully counterbalanced by a corresponding increase of bulk in the individual fibres.

after its removal from the body. Hair shut up for a thousand years has been taken out of Egyptian tombs in perfect preservation, as regards both strength and colour. It is not, however, so durable during life. 'It is generally stated,' says Mr Hassell, 'as an undoubted fact, that the hair may become white, or turn colourless, under the influence of strong depressing mental emotions, in the course of a single night. This singular change, if it does ever occur in the short space of time referred to, can only be the result of the transmission of a fluid possessing strong bleaching properties along the entire length of the hair, and which is secreted in certain peculiar states of the mind.'

Amongst other ethnological peculiarities, the colour and the texture of the hair are determined by race: latitude and climate affect them little, if at all. Dr Prichard, our best authority on this subject, appertains the greater part of the habitable globe to the melanio or dark-haired races. The xantho-comic, or fair-haired tribes, are almost, on the other hand, confined to the limits of Europe, and, within those limits, to certain degrees of north latitude.

The forty-eighth parallel, which cuts off England, Belgium, Northern Germany, Scandinavia, and the greater part of Russia from the ethnological map of Europe, may be taken, with considerable accuracy, as the great southern boundary of the fair-haired races. Between the forty-eighth and the forty-fifth parallels, again, there is a sort of debatable land of brown hair, in which France, Switzerland, part of Piedmont, Bohemia, and part of Austria Proper, nearly the whole of Hungary, and the Asiatic dominions of the czar to the north of the Circassian line, fail to be included. Spain, Naples, and Turkey are the seats of the genuine dark-haired races; 'so that, in fact, taking Europe broadly from north to south, its peoples present in the colour of their hair a perfect gradation—the light-flaxen of the colder latitudes deepening by imperceptible degrees into the blue-black of the Mediterranean shores.*' Not but there are many exceptions to these limits. The Celtic and Cymric races of Ireland and the Welsh and Scottish mountains, have black hair in spite of their northern position. The Normans, too, in whatever proportion they were originally dark, now rank decidedly amongst the black-haired races; while the Venetian dowds still glory in those luxuriant locks whose golden beauty has been immortalised by Titian. Nevertheless, the general rule, as we shall presently see, is sufficiently exact to have a practical significance in the eyes of the hair-dealer.

Few persons are probably aware of the extent to which the traffic in human hair is carried. It has been ascertained that the London hair-merchants alone import annually no less a quantity than five tons. But the market would be very inadequately supplied if dependences were solely placed on chance clippings. There must be a regular harvest, which can be looked forward to at a particular time; and as there are different markets for black tea and green tea, for pale brandy and brown brandy, so is there a light-haired market distinct from the dark-haired.

The light hair is exclusively a German product. It is collected by the agents of a Dutch company who visit England yearly for orders. Until about fifty years ago, light hair was esteemed above all others. One peculiar golden tint was so supremely prized, that dealers only produced it to favourite customers, to whom it was sold at eight shillings an ounce, or nearly double the price of silver. The rich and silk-like texture of this treasured-article had its

attractions for poets and artists as well as traders. 'Shakespeare especially,' says one of our authorities, 'seems to have delighted in golden hair. "Her sunny locks hung on her temples like the golden fleece;"' as Bassanio describes Portia in the *Merchant of Venice*. Again, in the *Two Gentlemen of Verona*, Julia says of Sylvia and herself: "Her hair is auburn, mine is perfect yellow." . . . Black hair he only mentions twice throughout his entire plays, clearly shewing that he imagined light hair to be the peculiar attribute of soft and delicate women. A similar partiality for this colour, touched with the sun, runs, however, through the great majority of the poets, old Homer himself for one; and the best painters have seized, with the same instinct, upon golden tresses. A walk through any gallery of old masters will instantly settle this point. There is not a single female head in the National Gallery, beginning with those glorious studies of heads, the highest ideal of female beauty by such an idealist as Correggio, and ending with the full-blown blondes of the prodigal Rubens—there is not a single black-haired female head amongst them.'

But all this has passed away: the dark-brown hair of France now rules the market. It is the opinion of those who have the best right to offer one on such a subject, that the colour of the hair of the English people has deepened in tint within the last fifty years, and that this change is owing to the more frequent intermarriages, since the Napoleonic wars, with nations nearer to the sunny south. Whether dark or light, however, the hair purchased by the dealer is so closely scrutinised, that he can discriminate between the German and the French article by the smell alone; nay, he even claims the power, 'when his nose is in,' of distinguishing accurately between the English, the Welsh, the Irish, and the Scotch commodities. The French dealers are said to be able to detect the difference between the hair 'raised' in two districts of Central France, not many miles apart, by tokens so slight as would baffle the most learned of our naturalists and physiologists.

Black hair is imported chiefly from Brittany and the south of France, where it is annually collected by the agents of a few wholesale Parisian houses. The average crops—we scorn the imputation of a pun—harvested by these firms, amount yearly to upwards of two hundred thousand pounds' weight. The price paid for each head of hair ranges from one to five francs, according to its weight and beauty; the former seldom rising above a pound, and seldom falling below twelve ounces. The itinerant dealers are always provided with an extensive assortment of ribbons, silks, laces, haberdashery, and cheap jewellery of various kinds, with which they make their purchases as frequently as with money. They attend all the fairs and merry-makings within their circuit, and the singularity and novelty of their operations are wont to strike travellers more than anything else which meets their notice. 'In various parts of the motley crowd,' says one who had stopped to stare his fill at one of the Breton fairs, 'there were three or four different purchasers of this commodity, who travel the country for the purpose of attending the fairs and buying the tresses of the peasant-girls, who seem, indeed, to bring the article to market as regularly as peas or cabbages. "They have particularly fine hair," he continues, "and frequently in the greatest abundance. I should have thought that female vanity would have effectually prevented such a traffic as this being carried to any extent. But there seemed to be no difficulty in finding possessors of beautiful heads of hair perfectly willing to sell. We saw several girls sheared, one after the other, like sheep, and as many more standing ready for the shears, with their caps in their hands, and their long hair combed out and hanging down to their waists. Some of the operators

* *Quarterly Review*, No. 124, p. 207: an interesting and comprehensive article to which we are indebted for some of the facts here brought forward.

were men, and some women. By the side of the dealer was placed a large basket, into which every successive crop of hair, tied up into a wisp by itself, was thrown.* As far as personal beauty is concerned, the girls do not lose much by losing their hair; for it is the fashion in Brittany to wear a close cap, which entirely prevents any part of the *chevelure* from being seen, and of course as totally conceals the want of it. The hair thus obtained is transmitted to the wholesale houses, by whom it is dressed, sorted, and sold to the hair-workers in the chief towns, at about ten francs per pound. The portion of the crop most suitable for perukes is purchased by a particular class of persons, by whom it is cleaned, curled, prepared to a certain stage, and sold to the perukeiers at a greatly advanced price—it may be forty, or it may be eighty francs per pound. Choice heads of hair, like choice old pictures, or choice old china, have, however, no limit to the price they may occasionally command.

The peruke itself is at least as old as the Pharaohs. A wig found in the temple of Isis at Thebes, is one of the Egyptian trophies of our national Museum. Nor, to judge from the bewigged busts and statues of the Vatican, would this triumph of the tonsor's art seem to have been unknown to the luxurious Romans of the Empire. But before tracing its after-history, we may turn aside a little to glance at the coiffures of generations somewhat less sophisticated than those which anticipated the greatest glory of the reign of the Grand Monarque.

The Assyrians, as might have been expected from the eloquent denunciations of the Hebrew prophets, were dandies of the first-water. A single glance at the engravings in Mr Layard's volumes will shew how exquisite were the bossings, the plaitings, and the curlings which they lavished on their hair and beards, and how unmistakably they 'exceeded in dyed attire upon their heads.' The Greek's innate love of beauty saved him from such ostentatious devices. The Greek lady allowed her hair to fall from the forehead in a graceful sweep round that part of the cheek where it melts into the neck, gathering it up behind into a bow-like ornament called the *κίρηνος*. A somewhat similar fashion prevailed amongst the men; but their gods they distinguished by characteristic variations of the coiffure. 'Thus the hair of the Phidian Jove in the Vatican, which rises in spouts as it were from the forehead, and then falls in wavy curls, is like the mane of the lion, most majestic and imperial in appearance. The crisp curls of Hercules, again, remind us of the short locks between the horns of the indomitable bull; whilst the hair of Neptune falls down wet and dank like his own sea-weed. The beautiful flowing locks of Apollo, full and free, represent perpetual youth; and the gentle, vagrant, bewitching tresses of Venus, denote most clearly her peculiar characteristics and claims as a divinity of Olympus.†

The hair of the Roman men was worn short and crisp until the decadence of the Empire, when Commodus set the fashion of wearing it long, and powdering it with gold or mica dust. In the provinces, it was worn long by all but slaves at least as early as the time of Cæsar. The head-dress of the Roman women was only exceeded in elaborate absurdity by that of the queen, Marie Antoinette, who invented a coiffure in which were represented 'hills and enamelled meadows'—we translate the description for the edification of our lady-readers—'silvery rills and foaming torrents, the well-trimmed garden and the English park!' Long hair continued

to be the fashion throughout the middle ages, in spite of the denunciations of the clergy. Serlo, a Norman prelate of the reign of Henry II., seems, however, to have been wiser in his generation than the rest of his brethren. He could act as well as talk. Having on one occasion brought the king and his court to a due sense of the iniquity of wearing long locks, the crafty churchman secured his victory on the spot by pulling a pair of shears out of his sleeve, and clearing the royal head in a twinkling. Still, the 'abomination' continued so much the mode, that, in the reign of Richard II., the hair of both sexes was confined over the brow by a fillet. Accident at length effected what threats of excommunication had failed to bring about. A wound in the head received at a tournament compelled Francis I. to have his hair cropped. The king's example was followed by his courtiers, and soon extended itself to England. Close cropping became the rage; and, as Holbein's portraits shew, was adopted by women as well as men.

But as the hair was shortened, the beard was suffered to grow long. The end of the sixteenth and beginning of the seventeenth centuries, indeed, comprise *par excellence* the period of magnificent beards. Henry's own was so large and profuse that it has been celebrated in song;* and who does not remember 'the great round beard like a Glover's paring-knife,' and the debate on the attire of Bottom?

The hair, as we all know, played an important symbolic part in the Civil Wars. The cavaliers of the reign of Charles I. reintroduced love-locks; whilst the Puritans, to mark their sense of the 'loathsomeness of long hair,' polled even closer than before. But as the hair lengthened, the beard in its turn was shortened. Peaked beards and moustaches became common, and continued popular with all save the straitest sectaries till the Restoration gave a blow to the cause, from which it never recovered.

This was the era of the reinvention of the peruke. Louis XIII. had ascended the throne of his ancestors without a beard, but with hair which had never been polled from his childhood. Every one concluded immediately that the courtiers, seeing their young king's long locks, would look upon their own as too short; and the conjecture proved correct. Nature could be imitated if it could not be forced, and the manipulations of the barber became a science. For a time the people refused to follow the dangerous example; but the peruke-fever at length became so universal that, in 1663, we find it raging in full fury in England. An entry in *Pepys's Diary* marks the date when the epidemic had spread to the middle classes of society: 'November 3 [1663]. Home, and by and by comes Chapman the periwig-maker, and upon my liking it (the wig), without more ado I went up, and then he cut off my hair, which went a little to my heart at present to part with it; but it being over and my periwig on, I paid him L.3, and away went he with my own hair to make up another of; and I by and by went abroad after I had caused all my maids to look upon it, and then concluded it do become me, though Jane was mightily troubled for my parting with my own hair, and so was Bease.'

Perukes grew so large during the reign of Louis XIV., and so numerous in size and form, that 'the face appeared only as a small pimple in the midst of a vast sea of hair,' and a technical vocabulary was framed to guide the uninitiated in their choice. The most erudite of modern *coiffeurs* might well be puzzled by such items as these: 'Perukes great and little; in folio, in quarto, in thirty-twos; round, square, and pointed perukes; pudding perukes; butterfly perukes; perukes à deux et trois marteaux,' &c. Even

children were not exempted from the infliction of wearing these manifold monstrosities.

If the ladies were loath to follow the men's example, and exchange their natural for artificial tresses, they at all events succeeded, by means of frizzing and piles of lace and ribbons, in building up a coiffure of such prodigious altitude as to intercept the view of spectators at the opera, and compel the manager to refuse admittance to all who wore such immoderate head-gear. So intricate, too, were its details, that ladies of quality were often under the hands of the artiste the entire day; and, when engaged to attend *ridottos* on succeeding evenings, were forced to sleep in arm-chairs for fear of endangering its finish!

Pigtails succeeded perukes in the early part of the reign of George III., but fell, in the last decade of the century, before the Gallo-mania and Pitt's tax on hair-powder. They continued, however, to be the bugbear of the soldier till 1808, when an order for their extermination was issued. The very next day, indeed, it was countermanded; but, to the great joy of the rank and file, it was then too late. The author of the *Costume of the British Soldier* relates that, on one occasion at Gibraltar, while this absurd fashion was at its height, a field-day was ordered, and there not being sufficient barbers in the garrison to attend all the officers in the morning, the juniors were compelled to have their heads dressed overnight, and, so pomatumed, powdered, curled, and clubbed, to sleep as well as they could on their faces! 'Such was the rigidity with which certain *modes* were enforced in the army about this period, that there was kept in the adjutant's office of each regiment a pattern of the correct curls, to which the barber could refer.'

The white peruke of the early Georgian era has now completely vanished even from the right reverend bench, and is only to be seen in our courts of law. Hair-powder has been banished to the servants-hall; the alpine elevation of the ladies' head-dress has dwindled into 'bands;' and the thick and flowing locks of Lawrence's early portraits have shrunk, in the man, to a coiffure, whose simplicity, if not exactly after the model of 'the curled Antony,' stands at least in advantageous contrast to the hideous devices even of sixty years since.

CAGLIARI.

We parted, dear reader, at the *campagna* of the Marchese, where I left you comfortably enjoying your siesta;* and now suddenly you are transported to Cagliari, the capital of the Capo di Sotto, or southern portion of the island of Sardinia, and the seat of government. You were no doubt fatigued, after your jolting and jogging over rough roads, and rougher mountain-paths; so you were in no mood to find fault with the accommodation at the one hotel of Cagliari, which even you might have been tempted to do, had you come straight from one of the palace hotels of superb Genoa. Neither did the *partie quarrée* of fleas excite your sensibilities so much as they would have done heretofore; you have become used to them, or they to you, which is about the same thing; for it is a well-known fact connected with their idiosyncrasy, that they are capable of sudden attachments to strangers, which, like many other sudden attachments, weaken materially on better acquaintance. Then, as for the gnats, why, positively their humming and buzzing has become your lullaby!

Neither have you any serious fault to find with the *cuisine*; verily, the roasted wild boar and the ragout of quails with which you were regaled last night, were delicious, despite the little admixtures I gently alluded to. But this morning—I sincerely regret to

say it—you were not quite so well pleased. Thinking to have a treat, and without asking or reflecting, you most incautiously, nay, most unwisely, ordered a simple breakfast of *café au lait* and bread and butter. Oh, inadvertent traveller, this land of the fig and the vine does not overflow with milk, although, indeed, it abounds in honey. Thus your treat ended in a grimace at sight of the thick sheep's milk with which you spoiled your coffee; and the lard-like sheep's-milk abomination with which you would not spoil your bread. The dairy business is carried on, on somewhat peculiar principles here. But you ask imploringly, is there no cow's milk? Is there no Christian-like cow's-milk butter to be had? Where are the cows? Where, indeed!

Cows are myths in Sardinia, and so are calves, though oxen are to be seen every hour. Solve this how you will, I never could. But while you are having some addition made to your meagre breakfast, let me tell you something about the place. In the first place, Cagliari is almost of sufficient antiquity to satisfy Jonathan Oldbuck himself, as it was founded by a colony from ancient Greece. It is, as you may perceive, built on a conical hill, commanding a most lovely and spacious bay. The part of the town on the summit of the hill—where you now are—is called the Castello, and is at once the most ancient and the most aristocratic portion of it. During the middle ages, the Castello comprised the whole city; but subsequently, the part called the Marina, stretching downward to the sea; and the suburbs, Stampace, on the western, and Villanuova on the eastern side, have been successively subjoined. Those three large square towers, which are so conspicuously situated, are considered to be fine specimens of Pisan art, and form enduring monuments of the Pisan occupation of the island. But do you hear that clank, clank? Ah, 'tis the poor galley-slave sweeping away yesterday's accumulations, positively heaped up at each doorway. The narrow ill-paved streets become, in very truth, a general receptacle. Witness the lady's-maid at the opposite balcony coolly shaking the linen, and generously adding her quota to the commonwealth of fleas.

Nice custom, certainly; but you are early this morning; it is like having a peep behind scenes, and by and by you will get used to all and everything. Especially, the English reader admires by and by the plan of swinging cords from balcony to balcony right across the street, for the purpose of airing motley woollen garments, or drying linen ones. However, it is a *fiesta* to-day, so they will soon be withdrawn. Sardinia, you must know, boasts more *minis* and more *festas* than any other country. So now the flags are flying from the forts and shipping, cannons are firing, and bells are ringing. Italians say the English know how to make bells, but don't know how to ring them. This is a matter of taste; you may admire your own way best. At anyrate, it is a merry jumble of sounds; and the streets are buzzing with soldiers and people, looking so blithe that their gaiety is positively infectious: even you forget your old English stiffness, and are betrayed into a whistle or the fag-end of some dear old English carol. Look now, at the pretty *pannetiera*; how exquisitely trim is her gay but modest toilet, how glossy the braids of her raven hair—*par parenthèse*, they don't know how to dress hair in England. And there comes forth from yonder portal a stately dame, a veritable Spanish *dofia*, her delicate rosary twisted round her most delicate and well-gloved fingers, which likewise contain her missal and fan; and such a fan, a very Goliath of the fan-tribe! Her dress is elegant; but much it surprises you that it should be an offshoot of the very same Parisian fashion-book we so carefully study in our colder north; it is so exquisitely simple

in its elegance. Shall we follow her to church? She is going with a stream of others to the cathedral. The cathedral is a fine building, much like other cathedrals, and the music is enchanting; but the soldiery; the variously handsome uniforms of the Piedmontese officers; the elegantly dressed ladies, intermingled with the rich wild rustic costumes of the different villages and the different crafts; the black velvet mantle of the regent, contrasting with the costumes of the various government officials; the foreign consuls; the monks, priests, and acolytes, form a *tout ensemble* only to be seen here, and worth travelling hither to see. It is impossible to appear even decently devotional, one is so much attracted by the deep devotion of everybody else.

Ah! now I see the use of mammoth fans, besides making a current of air sufficient almost to turn a mill. I just now detected from behind one of them the furtive glance of a most glorious pair of midnight-looking eyes; the shot was directed towards a very handsome young cavalry-officer, who evidently was on the look-out for it, while the duenna-like personage on the other side of the fan was calmly and unconsciously telling her rosary.

But the high-mass is over; the stream moves off, and you and I go with it. It is far too hot to go further now; we wend our way back; the stones, so pointed and uneven, are burning and torturing our feet. We are glad to get back to our hotel.

And now the streets are vacant, and so quiet, that, but for an occasional little burst of dog-dialogue, one might dream of being at Herculaneum. The fact is, Cagliari dines at this hour, and, after dinner, Cagliari always sleeps; doors are shut and bolted; you may as well rob a Cagliariite of his purse, as invade the sacredness of this his darling dinner-hour. I think I delicately hinted to you before that my beloved Sards had just a little dash of the gourmand; and now, while you are tossing on that very hard couch—sofas are all hard here—and getting up a very sharp appetite, spite of the heat, for a very good dinner—I will just tell you something about the Cagliari dogs—not the Cagliari puppies—these are too various in their species.

The dogs in Cagliari are stationed at the doors of their respective masters. There they sit, basking in the sun, and in general lead a very easy, gentlemanly dog-life. They never think of going into another street, or intruding on another dog's territories, excepting it may be for sociability's sake. Their numbers are restricted, and these have collars round their necks. They are aristocratic dogs; they know it, and feel it, and shew it, too, for there is a consequential wag of the tail, and an erect carriage of the head, which plainly bespeaks it. Besides these town-bred, gentlemanly dogs, there are lower-bred fellows living in adjacent villages. These enter the town regularly every morning in a troop, go to the market, make a round of the streets, and devour all the refuse of the town: they are canine scavengers, and thereby render a most important service; after which they retire as they came, *en troupe*—never associating in any way with the dog aristocracy, who, however, condescend to permit them to proceed on their mission unmolested.

The sun is lower in the horizon now, and Cagliari is waking up and stretching and gaping. Hark! there is music. Let us go to the Terrapieno, and see the *demoni*; halt first at the gate of the city, just to admire that wild, dark, barelegged, stilettoed, extraordinary figure sitting cross-legged beside a very mountain of gorgeous melons. How earnestly is he gesticulating with an equally picturesque and equally earnest customer. How their eyes flash!—how vehement they are! There, he has paid a trifle more, and got the melon:

contents. The very sight is appetising; so perhaps you incline to take an ice at yonder café—you will get delicious water-ices. Allow me, before you enter, to introduce you to the dark-eyed, fine-looking man in the very handsome uniform lounging before the door. His name is De Candia; his father is a certain General De Candia, though possibly his brother may be better known to you by the adopted name of 'Mario.' I hope you have no very striking peculiarity of person, dress, or manner; if so, be sure it will be placarded to-morrow in the café. He has the knack of illustrating these things with—it may be in some cases unpleasant—accuracy and piquancy; and, in short, though I never heard of his being ill-natured, his talents lie quite as much in guiding his pencil, as those of his brother in guiding his organ of sweet sound. The corpulent gentleman to whom he is speaking is a judge. There is a goodly supply of judges here, and, some say, a small supply of justice. Be that as it may, we pass on, and go inside. The thin taper dandy—one of the puppies of the place, by the way—with large moustaches, ambrosial locks, supremely white hands, and ring-laden fingers, is the Duca di C—, just come from *terra firma*. Sards call the mainland *terra firma* invariably. Turin is the place from whence he has lately returned, and he is telling the latest court-news to a small assortment of other notables, chiefly government officials and young Piedmontese officers, who form a very interesting group, for they are fine-looking, gentlemanly young men, quiet and refined in their manners; and their uniforms are peculiarly tasteful and becoming.

After enjoying the scene and the ices, you inquire how much you have to pay. You receive a low bow, with the information that the Baron—has had the distinguished honour of entertaining you. The Baron, meanwhile, has departed; you have no opportunity of thanking him for his civility, for you do not know him from Adam. You are perhaps a little confused by so much politeness; but it is the way of the place. Remember, you are in hospitable Sardinia. You receive more bows, and withdraw. You are a true, warm-hearted Englishman; you return their politeness with bland courtesy. Will you not blush to hear that some from our dear country—and some of noble birth too—have sadly failed in this respect, from a ridiculous notion of their own superiority; and must I add, that this rudeness was set down merely to want of culture and knowledge of the world.

But here we are on the beautiful public walk called Terrapieno. The music is a magnificent military band performing a selection from various operas. It is very delightful, for a breeze is coming from the sea, gently fanning the heated cheek.

What a glorious view is here! the beautiful bay, with its two grand promontories, Pula and Carbonara; the fine harbour, the magnificent mountain-ridge in the blue horizon, and then that rich teeming Campidano lying between: all luxuriant in vineyards, olive grounds, orange-groves, and gardens—with its wondrous cactus hedges, which look so grand, and give such an eastern look to the whole! Then yonder salt-lake, all alive with the feathered tribes, is during winter the resort also of whole flocks of brilliant flamingoes. It is a lovely scene; but we will pass through the pretty garden, at the end of the walk, called 'The English Garden,' very complimentary to our English taste for flowers!

We have rounded the cone-like hill, and now another scene awaits us; how wild and something desolate withal is the panorama here! Those grand giant rocks, what do they mean? There can be no Druid remains here. Then those wondrous excavations in the sides of the hill: ay, they have puzzled

of the Roman amphitheatre, in such excellent preservation too, and the deep yawning caves, underneath. All is very beautiful and wonderful; but we must leave it to go to commonplace-life again. It is dusk, the evening-drum is beating, candles lighting, the *benedizione* pealing. It is twenty-four o'clock. You wonder—not at all; the sun has set; he will not set again for twenty-four hours.

Lovers are dragging canes heavily along the pavement, to attract the quick ears and light footsteps of their *bellas* to the balconies. Serenades, some anything but melodious, are progressing; so perhaps, as the theatre is closed now until the return of the autumn season, you will proceed, either to the consulate, to spend a quiet evening with the best and kindest of England's representatives; or otherwise, if you incline, to a little foreign society, in the house of the Contessa C—, or the Marchesa D—, or Madame G— (the ladies, you know, *receive*), or half-a-dozen other places, where you may spend a pleasant evening, have lemonade and biscuits, perhaps brilliant conversation, and, in any case, a kind reception; only take care that your toilet is *soignée*, and that you retire early.

LIVING IN BARRACKS.

MANY years have passed away since it was the custom in the south of Ireland to live in barracks. Not in the military quarters, usually so named, but among a set of merry boys and girls, and good-humoured men and women, in some wide, rambling, hospitable country-house. The rebels, or Whiteboys, banded themselves together to destroy, without exception, every Protestant man and grown boy in the country; but they usually, except in rare instances, respected the lives of women and children. The gentlemen, gay, gallant, well mounted and well armed, formed themselves into yeomanry corps for the defence of their lives and properties; and in order to concentrate their forces and protect their families, a large mansion in each district was selected, into which as many of the neighbours as the rooms would accommodate congregated. Despite of the burnings, pikiings, murders, and cruelties of the most atrocious description which were going on around, the party inside usually contrived to amuse themselves with eating, drinking, laughing, dancing, and love-making, in a highly satisfactory and thoroughly Irish manner.

The old house of Carrigbawn, situated some miles distant from the town of Killyshaughlin, was selected for this purpose; its master and mistress being a kind and hospitable pair, never so happy as when every closet and cranny-hole was crammed full of guests. The mansion itself was as curious and comfortable a specimen of the in-and-out style of architecture as ever was seen. It and the fine old estate that lay around it are now gone—the one into ruins, the other into the Encumbered Estates Court. But some sixty years ago, both were filled with life and merriment. Family after family had arrived, and had been hospitably welcomed, and comfortably accommodated by Mr and Mrs Synge. Every available corner, including a dark recess, known as 'the cat's closet,' had been converted for the nonce into a sleeping-room. Dinner-time arrived, the whole company were assembled in the drawing-room, and the lady of the house was mentally congratulating herself on the admirable cubicular arrangements which enabled her to accommodate every one, when a loud ringing was heard at the hall-door. Bolts and bars and iron grating were cautiously and creakingly withdrawn, and presently the servant announced: 'The Reverend Athanasius Welbore!'

Angels and ministers of grace! he was the largest,

the most uncouth, and the worst-dressed man in the diocese.

His presence at dinner made no difference; the viands provided would have sufficed for a dozen guests in addition. But the sleeping-room! And Athanasius smilingly informed his hostess, that he had brought his carpet-bag, and meant to partake of her hospitality for some days, he having received a threatening notice, which rendered it expedient for him to quit his glebe-house. Of course, under the circumstances, a less hospitable person than worthy Mrs Synge would have made him welcome; but what was to be done? At last it occurred to her that she would throw herself on the kindness of the gay, good-tempered rector of the parish, a Mr Skottowe, who had been inducted into one of the best bed-rooms, containing a large-sized bed. In the course of the evening she took an opportunity of candidly stating her difficulty to this gentleman, and appealing to his kindness to bestow a share of his couch on the Reverend Athanasius. Mr Skottowe, of course, could do nothing but utter an apparently cheerful compliance; but in his secret soul he registered a vow, that wherever, and with whosoever Mr Welbore might sleep that night, it should not be with him.

One little fact illustrating the personal habits of Athanasius may perhaps be regarded as justifying Mr Skottowe's repugnance to his company. He was accustomed to use, and display somewhat ostentatiously, certain very large and stiff-looking white pocket-handkerchiefs. Some curious observers remarked that these articles were invariably marked with a series of brown diagonal lines; and by some skilful cross-questioning, the fact was elicited that the *soi-disant* pocket-handkerchiefs were doomed a double debt to pay, each one figuring first for a week as a cravat, and then doing duty for a second in the parson's pocket.

With this pleasing circumstance and other similar peculiarities full in his memory, the astute Mr Skottowe took care to be the first to retire to his room, and was snugly ensconced in bed when Athanasius, who remained up the very last of the company, made his appearance. While he was leisurely proceeding to disrobe, and talking complacently of the pleasant evening he had passed, Mr Skottowe began to scratch his own wrists and arms in a most ostentatiously noisy manner.

'What's the matter with you, man?' said Welbore at last, looking at him curiously.

'Oh, nothing. I'm nearly well now.'

'Why, what ailed you?'

'Not much; but you know I'm one of the agents appointed to travel through the country, and examine the poor people who are learning to read Irish; and unfortunately some time ago, from handling their books, or coming somehow in contact with them, I caught that very unpleasant and infectious complaint—the Caledonian Cremona—you know.'

'Speak plain, man!' thundered Athanasius. 'Is it —?'

'Just so,' replied his friend coolly. 'But I have given up for some time past instructing the poor people who have it, and I hope soon to be quite well. Indeed, it is only at night that my wrists annoy me.'

Vociferating a specially unclerical exclamation, and I fear consigning his intended bed-fellow to a locality abounding in the specific remedy for his cutaneous malady, Athanasius, now arrayed solely in his nocturnal garment, seized his candle and rushed wildly down stairs. Mr Skottowe, with a quiet chuckle, bolted the door, and calmly betook himself to repose. The unlucky fugitive, meantime, sped into the drawing-room, the only apartment which he found open, every one in the house having by this

time retired; and seizing two sheepskin mats, together with the hearth-rug and the table-cover, he lay down on the sofa, and having covered himself up very comfortably, soon fell fast asleep.

Now, it happened that Mrs Synge was always an early riser, and at this particular time, with such an additional weight of housekeeping on her hands, it especially beloved her to be up betimes, and look after the regulation of her household; so about six o'clock the following morning, she entered her drawing-room, and proceeded to open the shutters. The early daylight streamed in, and the first thing that caught the lady's orderly eye was the 'mingled heap' on her best sofa.

'Dear me,' she thought, 'that careless Kitty! she has gone and heaped the mats and hearth-rug on the sofa, instead of taking them out to be shaken.'

And with one energetic pull, she dragged off the offending articles. What was her amazement to behold start up the awakened Athanasius, who in his wrath, utterly oblivious of the very scanty nature of his clothing, began to pour out his indignation at the manner in which his hostess had treated him in sending him to sleep with such a companion. She, poor lady, naturally thought he was stark mad—very particularly stark indeed he looked—and she ran off as fast as she could to summon her husband to the rescue. When Mr Synge reached the scene of action, he was very much inclined to think that his wife's supposition was correct. For there was Athanasius, still in a boiling rage, stalking up and down the drawing-room, with a nondescript sort of night-cap perched on his head, while a crimson and gold table-cover, wrapped round him shawl-fashion, picturesquely surmounted his sole calico garment. The master of the house discreetly retreated, and sought an explanation from Mr Skottowe, which that gentleman prudently gave him through the key-hole of his bolted door. At length, however, a truce was concluded between the two belligerents, and Athanasius admitted to resume his garments. We will leave our readers to imagine the scene at the breakfast-table. Poor Athanasius gulping down cup after cup of tea, and half choking himself with enormous slices of ham and cold beef, in order to conceal his confusion; while the bland Mr Skottowe, with an air of mock penitence, sadly contradicted by the amused expression visible at the corners of his mouth, busied himself in eating a new-laid egg.

The genuine good-nature of the whole party, however, soon laughed off everything unpleasant; and in the course of the day the inventive genius of old Mrs Mahoney, a jewel of an upper servant, found out and arranged a separate sleeping-room for the Reverend Athanasius.

It was a dull drizzling day in autumn, such as is very common in the south of Ireland, when there is no cold in the air, and yet you have such a feeling of thorough and diffused dampness, that you involuntarily hang over the fire, as if to air not only your garments, but your hands and face. After breakfast, the gentlemen as usual went out in a party to patrol, and the ladies amused themselves, as they best might, with needle-work and gentle gossiping.

'How I wish,' said Mrs Synge, laying down her embroidery, and politely trying to suppress a yawn, 'that Hugh Lawrence were here! He is the very life and soul of a party, and so good-natured—there is nothing he would not do to oblige a friend.'

'Yes,' said Mrs Warren, 'and children are so fond of him. My little Ellie, who is so shy to every one else, actually flies into Hugh Lawrence's arms, and will not leave him for nurse or any one else.'

In addition to the grown people, there were about a dozen children collected in Carrigbawn House; and

elected for them in the person of one of the second-class refugees, a tithe-proctor named Dick Harris. A sad time he had of it, poor man! Obnoxious as his ordinary occupation rendered him to the rebels out of doors, his new calling made him by no means more acceptable to the juvenile mutineers within. They put crackers into his boots, and incited the cat to stick her claws in his wig. They placed a chair with three broken legs for him to sit upon, and managed—accidentally on purpose—to upset an ink-bottle over his new trousers. This last outrage was too much for the poor proctor. Apostrophising the whole crew as a set of young imps, and declaring that the girls were worse than the boys, he fairly abandoned them to their own devices, and took refuge by the kitchen fire. It was at this juncture, when the ladies in their quiet drawing-room were threatened with an invasion of their collective Willies and Lizzies, that Mr Lawrence's presence was especially longed for.

'He paid a morning visit here a few days ago,' said Mrs Synge, 'and we urged him strongly to leave his lonely thatched cottage, where he has no companions but his dogs, and come into barracks like every one else. "Why, my dear lady," said he, "who would hurt me? Thank God, I don't think I have an enemy in the country among rich or poor; and then I have my steward, that faithful fellow, Hennessey, who would give his life for me, living at the lodge."'

The conversation then took another turn, and the afternoon passed somewhat wearily away; its monotony now and then enlivened by the unavailing efforts of the matrons to preserve order amongst the juveniles, each lady protesting that her boys and girls were the quietest creatures imaginable when at home, and that it was only company that excited them to rebel.

The gentlemen returned in good spirits to a late dinner, and reported that they had seen or heard nothing alarming. About ten o'clock the house was disturbed by a loud ringing at the hall-door. It was no light matter to open at that hour, so the visitor was challenged by the master of the house.

'Who's there?'

'A friend—Hugh Lawrence; let me in!'

At the sound of that well-known voice, bolts and bars were speedily withdrawn, and the whole party crowded into the hall to receive the welcome guest, who looked pale and agitated.

'Synge,' he said, 'I have a dreadful thing to tell you. My house was set on fire this evening, and everything in it burned. I don't care for the furniture, but my poor little dog, Minny, that was licking my hand an hour before—she perished!' And the tears stood in his kind, honest eyes.

It appeared that, while sitting after dinner, he perceived a strong smell of smoke, and, rushing to the window, he saw the dark figures who had put the live sod of turf to the thatch, moving in front of the house. He had been out shooting that day, and his gun stood loaded in a corner of the room.

'I seized it,' he said, 'and fired off both barrels at the fellows, but I could not tell in the twilight whether I hit any of them or not. I saw one man, whose face was blackened, take deliberate aim at me, and I heard an explosion as if his gun had burst in his hand. They rushed to the door, forced it in, and in another moment would have murdered me, when by God's providence a party of soldiers who were passing saw the flames, and came galloping up the avenue. The fellows, of course, made off, and the soldiers tried in vain to catch them. I escaped, just as the roof was falling in, and came on here, as I knew you would not turn me out.'

A warm pressure of the hand was Mr Synge's

'They were out,' was the reply. 'The old cook and the housemaid had asked leave to go to a wake in the neighbourhood; and Leary, my man-of-all-work, had gone out to the stable to feed the horses.'

Mr Syngue and the other gentlemen looked grave.

'Where was Hennessey, your steward?' asked Mr Warren.

'Oh, poor fellow, he has been sick these two days,' replied Mr Lawrence. 'I sent for him this morning, and heard that he was confined to bed with a heavy cold; and there I found him with his head tied up, when I went down to see him and take him a few things that I thought would do him good. If he had been with me, he'd have shed his last drop of blood for me: you know he's my foster-brother.'

There was no difficulty that night in finding a bed for Hugh Lawrence. Poor Athanasius was the first to propose to resign his dormitory, and betake himself once more to the sofa. Mr Skottowe followed suit by offering, with a hypocritical twinkle of his eye, half his bed, if Mr Lawrence had no objection to share it.

'Why, then, you've a deal of brass, that's all I can say for you, Skottowe,' said Athanasius, shaking his fist at him good-humouredly. 'If you don't die a bishop, it won't be for want of asking.'

Next morning, at breakfast, the delight of the children at meeting their friend was vociferous. He was not so much inclined to play with them as usual, for the loss of his favourite little terrier lay heavy at his heart. And the bright, round, young eyes that were fixed on him soon filled with tears, when they heard of the fate of Minny, who had been as well known, and almost as much liked, as her master.

After breakfast, all the gentlemen accompanied Hugh Lawrence to his cottage, now a heap of smoking ruins. The police were also in attendance, with a view to making every possible investigation. Of course, there was no chance of eliciting any information from the servants or the peasantry. They had seen nothing, known nothing; and the party were on the point of going away, when one of the police picked up on the lawn a gun with the barrel burst, and three fingers of a man's hand, which had evidently been blown off by the explosion. Here was a clue. The party immediately set off, and visited every house for miles round, without finding any man with a disabled hand; but as they were returning from their fruitless search, they passed by the cottage of Hennessey, the steward.

'There's no occasion, my friends,' said Mr Lawrence, 'for any of you to come in here; but I'll just step in for a moment to ask how poor Tom is to-day.'

'If you have no objection, Hugh,' said Mr Syngue, 'I'll go in with you.'

They entered the house, where Hennessey's wife was ready to receive them, and to pour forth most voluble expressions of sorrow for 'the poor darling master's misfortune.'

'But how is Tom?' asked Mr Lawrence, moving towards the door of the inner room. 'I suppose I can see him.'

'Indeed, your honour had better not,' said the woman earnestly. 'He's very bad in his head to-day, and I'm afraid of my life 'tis the sickness* he's getting; and maybe your honour might catch it from him.'

'Oh, I'm not in the least afraid.' And gently putting the woman aside, he went in, followed by Mr Syngue.

The room was nearly dark, and they could discern only the outline of Hennessey's figure in the bed. He seemed scarcely able to answer his master's kind inquiries, and spoke in a hoarse, tremulous whisper.

'Well, Tom, my poor fellow, I'll send Dr Taylor to see you before night. Good-bye.'

'No, sir, thank ye, no doctor; I'll be quite well to-morrow!' exclaimed the sick man, in a clear, strong voice, whose changed tone struck even the unsuspecting Lawrence.

Mr Syngue immediately flung the shutters open, and walked up to the bedside.

'Shew me your hands,' he said. No answer.

He pulled down the bed-clothes, and Hennessey's right hand appeared bound up. The next moment the police were called in, the bandage was removed, and the three fingers exactly corresponding to those picked up on the lawn were found wanting to the ghastly bloody hand.

The hardened traitor said nothing; his kind master burst into tears.

The sequel of this true tale may be told in a few words. Hennessey was lodged in jail, fully convicted at the next assize, and most deservedly expiated his crime on the scaffold.

There was one gleam of comfort for Hugh Lawrence, after witnessing Hennessey's arrest; while getting off his horse at Mr Syngue's gate, he thought he heard a faint whine, and looking down, he saw a miserable little animal, with its hair singed off, lying exhausted on the ground.

This was his little favourite terrier, which had somehow crept out of the burning ruins, and with the wonderful instinct of her race, had painfully tracked her master's footsteps.

He took her tenderly in his arms. 'Minny is found! Minny is safe!' was the cry through the house. And if Minny had been the daughter and heiress of a noble family, more care could not have been bestowed on her comfort and restoration.

The little animal was soon well enough to accompany her master to England, whither some of his kind friends took him on a tour, until the terrible scene of Hennessey's execution was over.

THE ANCIENT RESERVOIRS OF ADEN

MANY and great have already been the vicissitudes of the town of Aden. In remote times called 'Eumalmore' or the Prosperous, it continued to prosper as the principal emporium of trade between Europe and the east, till the adventurous Portuguese opened out a new and more convenient ocean-route for the merchandise of India and China. The tide of traffic thus diverted from Aden, its prosperity gradually declined. The Turks got possession of it in an underhand way, just forty years after Vasco de Gama had rounded the 'Cape of Storms,' and they seem to have done a good deal to fortify and improve the town. At the beginning of the eighteenth century, however, Aden was governed by a native prince. By this time Mocha had successfully rivalled it as the seat of the coffee-trade; and when the East India Company took possession of it in 1839, it was a poverty-stricken, decayed place, having only a lingering remnant of traffic in guns, with about six hundred squalid Arabs for inhabitants, and with no foreign ships to rock securely within its noble harbour.

However, the tide has now turned in its favour, and British rule and the overland route to India combined, bid fair to raise the place to far more than its ancient importance. It can now boast a busy population of 25,000, gathered out of almost every nation under Heaven; the annual value of its imports and exports is little short of a million sterling, and its port is crowded with shipping. It is a depot for steamers, and a principal coaling-station. Here voyagers gladly disembark before or after the somewhat anxious threading of the coral-reefs in the Red

* Typhus fever.

Sea, to 'take their ease in their inn,' and explore—as we are now about to do—the marvellous reservoirs with which we rejoice to be told that the district abounds. For a thirsty district indeed it is, without trees to shade it, without running streams to freshen, its lofty semicircle of barren limestone and lava rocks—but for the relief of the sea-breeze—reflecting intolerably the fierce glare of the tropical sun. The one serious drawback to the permanent importance and prosperity of Aden threatened to be the inadequate supply of fresh water: experiment after experiment was made, new wells were dug with no other result than that of drying up old ones, and vast sums laid out, all in vain.

It would seem, therefore, that the nineteenth century must be content to take a lesson in practical science from the wisdom of the past; and that having discovered a magnificent series of ancient reservoirs for the collecting and storing of rain-water, it can do nothing so well as persevere in their restoration, or, if need be, undertake the construction of others.

It appears that this plan of collecting water in reservoirs is of extreme antiquity in Araby the Blest. The earliest and most gigantic work of the kind we know anything about is the great dam of Mareb, built, some historians aver, about 1750 B.C.—the time when Jacob in his love for Rachel was tending her father's flocks, 'while in the day the drought consumed him and the frost by night.' M. Arnaud, a French traveller, who reached Mareb in 1848, describes the ruins of this wonderful dam as situated between two hills, which, when joined by the embankments, formed the reservoir. So vast was the space thus enclosed, that even in that desert stillness, no shout, however shrill, could reach from one end of it to the other; and the massive fragments of masonry that yet remain bear witness to the former solidity of the whole. Probably this was the great original of other reservoirs in this and other parts of Arabia, as well as of those which the Saracens introduced into Spain during their period of triumphant sway. None of these, however, in any way equals the magnificent series of reservoirs lately discovered at Aden, which appear capable, if duly restored, of containing not less than 30,000,000 imperial gallons of water.

But who built these colossal tanks? we ask, and ask in vain. Even the natives shake their heads, and have no certain tradition to offer. Ancient, very ancient, no doubt, their walls have long survived the names of those who reared them; but the impression of Mr Playfair, the political resident at Aden, to whom we are indebted for our information respecting them, is, that they were begun after the second Persian invasion of Yemen, about the year of our Lord 600. Possibly, many owe their origin to individual piety and patriotism; possibly, some were intended as monuments to perpetuate the fame of the dead, as well as to promote the welfare of the living, for under the domed entrance to one of them a tomb has been discovered, and it is said that an inscription was removed from the tank which might have given some clue to its history.

According to local tradition, it was about the year 1500 of our era that these reservoirs began to fall into disuse, the governors of Aden having persevered in digging wells with sufficient success to meet the wants of the already declining city. We read also in a Latin tract, written in 1530, of another expedient: 'The water was daily brought in on camels, whose number sometimes amounted to 1500, 1600, or even 2000.' If this gaunt and clumsy procession arrived in the daytime, the water was circulated through the city; if in the evening, it was deposited in a large cistern near the water-house. This large cistern was

description: 'Among the ruins, some fine remains of ancient splendour are to be met with. The most remarkable of these remains consist of a line of cisterns situated on the north-west side of the town, three of which are fully eighty feet square, and proportionably deep, all excavated out of the solid rock, and lined with a thick coat of fine stucco, which externally bears a strong resemblance to marble. A broad aqueduct may still be traced which formerly conducted the water to these cisterns, from a deep ravine in the mountain above. Higher up is another, still entire, which, at the time we visited it (November), was partly filled with water. In front of it extends a handsome terrace, formerly covered with stucco; and behind it rise some immense masses of granite, which, being in some places perpendicular, and in others overhanging the reservoirs, formed, during the hot weather, a most delightful retreat. Some Arab children, who followed us, were highly pleased when we arrived at the spot, and plunging headlong into the water, much amused us by their sportive tricks.'

About thirty years later, Captain Haines, visiting Aden, found several of these reservoirs still in tolerable preservation. Besides the hanging tanks, as those built high up on the rugged mountain-sides are called, there were other large ones still to be traced around the town. We are sorry to be obliged to record the fact that, since the occupation of Aden by the English, the tanks have been not only neglected, but injured. The hanging tanks, fortunately, were pretty much out of reach; but the stones of those that lay ready to hand, were ruthlessly carried away for building purposes—the hollows filled up with the debris washed down from the mountains, and the whole believed to be ruined beyond the possibility of repair.

Meanwhile, more than half the population of Aden was drinking water brackish beyond what is usually considered endurable; and many thousand tuns of rain-water were annually lost from want of means to retain it. And now, let us gladly learn how efficient an apparatus for so doing had been all the while buried out of sight, to be restored by the energy of the political resident.

Four years ago, government sanctioned the repair of the three tanks known to be in tolerable preservation; the superintendence of the work being intrusted to Mr Playfair, who, at first, was obliged to content himself with convict-labour, and such assistance from free labour as the small surplus of the town-funds, and the sale of the rain-water collected in the cisterns, enabled him to obtain. At that time, he had no idea that the tank-system was so widely extended, and he expected to carry out the undertaking on the inexpensive plan above mentioned.

But day by day, new discoveries were made; and government came forward liberally to insure the successful completion of an enterprise, which we shall be better able to understand when we have read Mr Playfair's description of the environs of Aden:

'The range of hills which forms the boundary of the crater of Aden is nearly circular; on the outer side, the hills are very precipitous, and the rain-water rushing rapidly down them by means of long narrow ravines separate from each other. On the inner side, the hills are quite as abrupt; but their descent is broken about half-way down by a large table-land, intersected by numerous deep ravines, nearly all converging from the principal range of hills into the Tawela Valley, which thus receives about a quarter of the drainage of the peninsula. This valley is 700 feet in length from the point where it leaves the table-land to its actual junction with the level plain of the crater. The hills throughout are perpendicular; and at the head of the gorge they meet, leaving barely

then gradually opens out to a breadth of a hundred and fifty feet, and the hills circling to the right and left form part of the walls of the crater of Aden.

The steepness of the ravines, the exceeding hardness of the rocks, and their scarcity of soil, all combine to prevent any considerable amount of absorption. Thus even a moderate fall of rain will send a raging torrent down the Tawela Valley, which, ere it reach the sea, not unfrequently swells to an unfordable river. Much damage has thus been frequently done. Reed-houses, animals, nay, human beings, have been swept along into the sea; and during a December fall of rain in 1842, such was the fearful rush of water through the gorge, that two hundred animals were carried away; and when the morning broke on the scene of devastation, nine men were missing, and only three of their bodies were ever found.

Thus, then, we see there is not only a great good to be gained, but a great evil to be avoided. The water-sprites have to be subdued into a blessing, or submitted to as a scourge. The wisdom of earlier ages had taken the first course—their gigantic reservoirs chiefly occurring in and near this main water-course. These have been described by most travellers as excavated out of the solid rock; but Mr Playfair's account differs from theirs in this particular: he describes those at the foot of the hills as generally built at some re-entering angle of the rock which promises a copious flow of water; there the soil has been carefully cleared away, and a salient angle or curve of masonry built across it, while every feature of the adjacent rocks has been taken advantage of, and connected by small aqueducts, to insure no water being lost.

The overflow of one tank is conducted into another, and thus a complete chain once existed into the very centre of the town. Their construction is extremely fantastic, the only principle which seems to have been adhered to being an avoidance of straight lines; and the correctness of this principle has been proved in the recent excavations, as in almost every instance where straight lines existed, they were forced in by the rush of water. The tanks are generally of stone and mud-masonry, roughly plastered on the outside, and beautifully coated with plaster within; flights of steps, gradients, platforms, are heaped together, and give an exceedingly grotesque appearance to the whole. Each large tank has a smaller one in front of it, built for the purpose of retaining all the earth and stones carried down by the torrent, and permitting a pure stream of water to flow into the reservoir beyond. And now for what has been already done: 'Thirteen reservoirs, having an aggregate capacity of 3,500,000 gallons, have been cleared out and restored; thirty-six more discovered, but not as yet excavated. Up to September last, the expense incurred amounted to 1100 rupees; and in the same month, a moderate fall of rain, lasting only three hours, sufficed to fill the restored tanks to the brim. The water thus collected realised, up to the following February, 2200 rupees, or double the expenditure incurred—water having a ready sale in Aden at one rupee per hundred gallons; nor is this all, for over and above the quantity disposed of, there remained a surplus of about 600,000 gallons.' A pleasant sight this filling of the restored reservoirs must have been to all, especially to those whose energy had been instrumental in the work—a pleasant sight to see the mountain-torrent, no longer wandering at its own wild will, but led from tank to tank, gurgling over the lip of the highest, running along the skilfully constructed aqueducts, getting filtered in the smallest reservoirs, and gradually filling those lowest down in the valley. Thousands of all classes and ages flocked to the refreshing sight—how refreshing we, in our cloudy and temperate climate, can little know; and

the noise of the rushing water was fairly drowned by the acclamations of the crowd.

It is calculated that even in the most unfavourable season not less than 6,000,000 gallons will be collected; and thus a minimum annual value of 60,000 rupees (L.6000) produced, while the restoration of all the tanks would insure an annual supply of from twenty to thirty million gallons. We therefore trust that the Indian government will not stop short of this great result. Rendered independent of all external sources for its water-supply, it is difficult to place any bounds to the possible importance and prosperity of Aden. Should the projected sea-canal from Suez to Pelusium be ever carried out—and the equilibrium of the Mediterranean and the Red Sea being now established, affords a strong hope that it will—a direct passage to the east would be afforded to ships of the largest size. The great Indian trade would probably take this route, and the importance of Aden as a coal-depôt and mercantile station being proportionably increased, it would no longer look back to the past for its palmy days, when conquering Rome bestowed on it the title of Romanum Emporium, but forward to the future, with commerce and civilisation ever increasing, and under British sway.

WORDS:

FOR THE GERMAN STUDENTS' FUNERAL-TUNE.

(IN MEMORIAM: NOVEMBER 1857.)

'Thou wilt call, and I shall answer Thee: Thou wilt have respect to the work of Thine own hands.'

With steady march, along the daisy meadow
And by the churchyard wall we go;
But leave behind, under the linden shadow
One, who no more will rise and go:
Farewell, our brother, left sleeping in dust,
Till thou shalt wake again—wake with the just.

Adown the street, where neighbour laughs to neighbour,
Adown the busy street we throng;
In noisy mirth to live, to love, to labour—
But he will be remembered long.
Sleep well, our brother! though sleeping in dust:
Shalt thou not rise again—rise with the just?

Farewell, farewell, true heart, warm hand, left lying
Beneath the linden branches calm;
'Tis his to live, and ours to wait for dying—
To win, while he has won, the palm.
Farewell, our brother! But one day, we trust,
Call—he shall answer Thee—God of the just!

TO THE ADVOCATES OF 'WOMEN'S RIGHTS.'

A gold medal of the value of 1200 francs has been offered by the Imperial Academy of Sciences, Letters, and Arts, of Lyon, for the best essay on the means of improving the moral and economical position of women: shewing first, how the remuneration of women may be raised to an equality with that of men, where there is an equality in usefulness and work; and second, pointing out new careers for the sex, and distinguishing new kinds of work to replace those of which they are and may be successively deprived by the competition of men, and the changes of customs and manners. Competitors are to send their works free to the secrétaire-général of the Academy, each manuscript to be distinguished only by a motto, and the same motto to be repeated in a separate note containing the name and address of the author.

Printed and Published by W. & R. CHAMBERS, 47 PATERNOSTER ROW, LONDON, and 389 High Street, EDINBURGH. Also sold by WILLIAM ROBERTSON, 23 Upper Sackville Street, DUBLIN, and all Booksellers.

PRICE 1½d.

A MEDICAL MAN'S EXPERIENCES.

ALTHOUGH, in the eyes of the world, I may seem to be middle-aged, and of limited income; to have a tendency to baldness, and to possess a profusion of small children; to be in a state unprosperous and unpromising in a very high degree—I am still, in the opinion of the faculty, a rising young man with very excellent prospects. In the medical profession, no man is old until he is superannuated, and Hope—by means, as it would appear, of some curious chemical preparation—is made to flourish as an evergreen, whether it ever bear fruit or not. Let the weather be ever so favourably unhealthy, let the street-accidents be ever so interestingly serious, no case ever comes to my door—that is to say, no case with anything in it. There are, of course, however, candidates for my gratuitous attentions, enough and to spare. And here are three of my best patients, selected out of a ten years' diary.

Case I.—A. B. Female. Age 49. Profession, sick-nurse. Habit, plethoric. A. B. came upon my hands not at all before it was necessary. She had been seriously ill—the effect of years of indulgence in spirituous liquors—for weeks, and during that time she had been taking hairs of the dog that had bitten her, by way of cure. When I told her, as I felt it my duty to tell her, of her immediate danger, and of the almost certain result of her complaint, she was exceedingly affected and alarmed. Used as she had been to contemplate death in all its phases when it occurred to other persons, she was terrified to the last degree at its approaching herself. She shuddered to think of that cold shadow creeping over her, which she had often watched, unfeelingly enough, and even with impatience, darken the features of her fellow-beings, when its delay chanced to interrupt some trifling scheme of business or pleasure of her own. Her countenance, with the exception of her nose, whose colour circumstances had long rendered quite independent of the action of her feelings, blanched at the few serious sentences which I addressed to her, as though they had been veritable thrusts from the javelin of the grisly King. Her respectable, I might almost write her colossal legs, trembled beneath her while she listened. It was evident that A. B. had some very particular reasons of her own for living a little longer. This feeling, as far as my experience goes, is not peculiar to A. B., but the intensity of it was. Horror at the thought of dissolution is seldom exhibited, if even felt by this class of persons; abject fear such as hers could, I

deep-dyed guilt. I was not much surprised when I was sent for to her lodgings for the second time upon that same night. She had been revolving in her mind what I had said to her, and it had disturbed her greatly. She felt more unhelpful than in the morning, and thought herself sinking. 'The worst,' as the nurse in attendance upon her rather unpleasantly remarked, upon my entrance, 'had come to the worst,' and I was required, she hinted, less as a doctor than as a father-confessor.

'Send that woman away,' said the patient in a hoarse whisper, and pointing to the attendant; 'all nusses is bad uns. I was a nuss myself.'

I motioned the obnoxious witness out of the room.

'I'm dying, doctor; I feel it. You're sure I am dying, ain't you?' interrupted she, changing her solemn tones for very shrill ones, and suffering her mask of forced repentance to drop momentarily aside, and disclose an expression of suspicious cunning—'you're quite sure?'

'We are sure of nothing,' said I gravely: 'you are very seriously ill.'

'I know,' exclaimed she bitterly, relapsing into her melancholy phase again; 'that is what all you doctors say; but it means death. O, sir, I have been a very, very wicked woman indeed. I have something—I have three things on my mind, which it will do me good, I think, to get disburdened of: they will kill me else, I feel, of their own selves. And, sir, I have not got a soul in the world to tell them to, only you.'

So this dreadful old person had indeed dragged me out of my warm bed for the purpose of reposing in me a dangerous confidence, which my own good-nature invited. I should like to have seen A. B. venturing to make a confidant of Dr Cressus in the next street after this same fashion. But it was just like my luck.

'Do you remember the very stout gentleman, doctor—him with the appleplexy in Ward No. 2—at St Barnabasses?'

'446. Pleurisy. Left convalescent?' inquired I, from memory.

'The same, sir. I bled him to death, doctor, at his own house within the week. His friends paid me by the job, you see, and I was overanxious to get it over.'

'Good heavens!' cried I; 'and to save yourself a little trouble, you committed, then, a cruel murder?'

'He went off like a lamb,' cried the wretched creature apologetically. 'But there's worse than that. I once gave a young gent. four doses of laudanum in one, and you wouldn't a known when he was dead from when he slept. But them was murders for all that, I

'They certainly were, miserable woman,' cried I indignantly. 'Have you anything yet more upon your mind?'

'Hush!' whispered she, pointing towards the door; 'she's listening; they always does it, bless you—I knows 'em so well. Once—only once, as I'm a sinful woman—I smothered a sick man with his pillow; that was for his money; he would have died any way, because he had the lock-jaw. Now,' added she, with a long-drawn sigh, and after a pause, 'I feel somehow better and more comfortable like, thanks to you, sir.'

The patient had sunk back from her sitting-posture, as if exhausted with this terrible narration; but I read in her yet anxious eyes that she had still something more to say. Presently she again broke silence, and this time the emphasis with which she spoke was mingled with a tone of gratitude. She desired to recompense me, I suppose, for my prompt attention and interest, and delivered herself of this advice instead of a fee:

'When your time comes, doctor, and your friends send for the nuss, don't let them pay her by the job.'

The revelation of these crimes, which had been, without doubt, in reality committed, filled me with horror; and the reflection that she who had executed them would, in a few days at furthest, be out of the world, and no longer harmful, alone comforted me. My feelings, therefore, may be imagined by the sensitive, when, upwards of a fortnight after I had received the above confession, A. B., whom I had supposed to be far 'otherwhere,' as the poets say, called one morning at my private residence, in tolerable health, and also slightly in liquor. She had been priming herself to act rather a difficult part.

'I am come,' said she, 'to thank you, doctor, for your care and trouble about me when I was ill. I was very ill indeed, was I not, doctor?'

'You thought you were going to die,' remarked I with meaning.

'Yea,' answered she ingenuously, and without heeding the slight discrepancy between her two statements, 'and that is what I am come about to you, doctor. You knows as well as me what a parcel of nonsense folks do talk when they are delirious, and thinks they are in particular notice. [I afterwards discovered this expression to be A. B.'s rendering of the phrase *articulo mortis*.] You must not be hard upon what a party says who has got the trembles. You must let bygones be bygones, doctor.'

I don't know whether it was weak of me, or whether it was strong-minded—whether I thought a confession upon a death-bed ought to be sacred, or whether it was to save myself trouble; but I let the old woman go, with a caution to the effect that she had better not let me hear of her attending any sick folks in future, which she took in exceedingly good part.

Case II.—I became acquainted with H. M. in the wards of St Barnabas, a young man who was by profession a prize-fighter, and who had come into the hospital with a dislocated knee, the consequence of kicking, violently and without due calculation of distance, at a personal friend with whom he had had a disagreement at a public-house. His habits had been very much the reverse of temperate, and the case which at first seemed simple enough, soon assumed a serious aspect: after many weeks of almost incessant suffering, it became necessary that the poor fellow should lose his leg by amputation, if he would preserve his life. The lopping of this limb was to him an especial grief, inasmuch as, next to the loss of one of his 'mauleys,' it was the saddest thing that, to one of his calling, could possibly happen. His occupation as 'a favourite of the public,' a pet of the fancy, would, of course, be gone for ever, and

no other line was open to him, since the talents of a prize-fighter, however rare and valuable in themselves, so far from being of universal application, are an absolute hinderance to success in almost every other walk of life. There was, indeed, about as bad a look-out for poor H. M., when he was carried into St Barnabas' theatre to be acted upon, one April morning, as can be conceived. Still, the brave young fellow never winced or grumbled; he made his bow to the great semicircle of students—the rows of unfamiliar faces reaching from floor to roof—as though they were his ancient patrons of the ring. There was no chloroform in those days; but he looked on at all the proceedings which concerned him without one twitch of the mouth or knitting of the brows; and when the thing was over, and that limb, which he had been so long accustomed to consider his own, became the property of the scientific gentlemen around him, he said: 'I thank you, gentlemen,' in a cheery voice, and wished them joy of their acquisition.

I confess that, in spite of his disrespectful calling, I had a sincere liking for H. M., and pity for his misfortune; and as one of the dressers in his ward at that time, I had opportunities of doing him, occasionally, a little kindness, and speaking an encouraging word. We struck up quite a friendship, founded upon the basis of mutual respect, but, I feel bound to admit, without any great mixture of sentiment. He confided to me several particulars concerning the fancy and its patrons, which are not generally known, but which the same honourable feelings that kept me silent with regard to the delinquencies of A. B., prevent me from here disclosing. When the day came for the young prize-fighter to depart—with the exception of his left leg—from St Barnabas, he addressed me in these terms:

'Doctor, you have been a regular stunner to me all along since I have been here, and no mistake; I should be sorry to leave this here hospital without letting you know what I think about it. Most like, you imagined that a poor chap such as me had nothing to give you in return—which only makes it the more brickish—but I am not so bad off as I seem, doctor, by no manner of means.'

This was exceedingly gratifying to me, and even very exciting. I was trying to recall to my mind some of those instances which I had heard or read of concerning millionaires in the guise of scavengers, angels under the earthly form of crossing-sweepers, who have been, as Mr Lamb says, 'entertained unawares' by benevolent surgeons and others, and pondering whether H. M.'s fortune was more likely to be in the funds or in railway-shares, when that grateful young man resumed as follows:

'Here,' cried he, drawing a coin or medal, wrapped up in whity-brown paper, from his breast-pocket—'here is, if not money, at least money's worth: to one in your station and with your opportunities, etc., a matter of—ah—a pound a week for life, at the very least. Even in my humble walk, it has been a pretty penny to me already.'

'Why, my good man,' cried I, in unaffected disappointment at the discovery, 'this is only a half-penny!'

'Only a half-penny!' repeated H. M. with a delighted chuckle, as he hobbled away on his crutches in order to preclude any thanks for his generous behaviour. 'That's what you'll be trying to persuade other folks to believe before the day's out. It is only a half-penny; but it is a half-penny with a couple of tails upon it!'

H. M. opined—so little does one-half of the world guess how the other half lives—that the respectable profession of medicine demeaned itself like his own by the practice of tossing for half-crowns; and, seriously, if things continue as they are much longer

with me, I think I shall try my luck with that headless half-penny, the only pecuniary fee I have ever received.

Case III.—Once—and that day will not easily be forgotten—I was sent for to attend a lady at a fashionable hotel, and that lady a member of the aristocracy. She was a woman of strong force of will, and had made a point of having the nearest doctor summoned, or else they would have sent for Dr Croesus to a moral certainty. For my part, I wish from the bottom of my heart—but I am anticipating.

The Lady Letitia Beebonnet was Scotch, and 'a wee bit crackit.' She was violent and impetuous upon all subjects—'a monomaniac,' as was said of a greater lady, 'about everything;' but inflexibility of purpose and contempt for conventional practices and opinions were her *forte*. Her present idea was, that so long as she chose to remain in any hotel, no matter for what term of months or years, she never need settle the bill till she went away. She had come to the *Fleur de Lis* without any intention of staying beyond ten days or so; but as her ladyship's account had been sent in somewhat peremptorily at the week's end, she was now staying on, out of spite, and for the express purpose of declining to settle it. Under ordinary circumstances, a person of Lady Letitia's rank might of course have resided in an inn for half her natural life without being troubled by the host; but in this particular case, the hotel belonged to a company, whose accounts were audited every week, and to whom the manager was responsible. He also, plebeian though he was, had that quality in superabundance upon which her ladyship so justly prided herself—pigheadedness. Upon the reiterated refusal of his aristocratic lodger to loosen her purse-strings, he had given to her some pieces of his mind which were not only unpalatable, but had disagreed with her to the extent of sending her to her bed; she was ill, and very ill, absolutely through sheer rage and obstinacy, and threatened to become worse with opposition. The manager had sworn that, upon the morrow, which was the end of her third week's sojourn with him, the Lady Letitia Beebonnet should settle her bill or leave the house; and her ladyship prepared for battle by sending for the nearest doctor.

I gathered these particulars from herself at the first interview, narrated with a garrulity such as I never heard equalled, and with an amount of accompanying action such as I had only seen examples of in establishments devoted to the insane.

'What I stand for,' concluded she, with vehemence, 'is the law—the law. I have plenty of money, hundreds of pounds, in that dressing-case yonder, but he shall never have one farthing of it upon compulsion, nor until I choose.'

As soon as I had recovered her ladyship out of the hysterics into which she had gradually worked herself during this recital, I took my leave. On my arrival the next afternoon, I found that the exasperated manager had refused to let her ladyship's bell be answered, or to supply her with food.

She had comforted herself for some time by pulling at the rope at her bedside, under the idea that she was at least creating a disturbance, although nobody came; but the domestics had placed a worsted stocking over the clapper. She was very unwell, indeed, by this time, and her complaint was not improved by the fact of her having had nothing to eat since the preceding afternoon; but she was considerably more obstinate than before, and quite prepared to starve rather than surrender what she imagined to be her legal rights.

Upon my remonstrating with the manager, he protested that she might starve, and welcome, but that he would put up with her nonsense, and be

hour longer. The company was of more consequence to him, he irreverently observed, than all the Beebonnets over the border.

'But,' urged I, 'if the Lady Letitia dies in your hotel, it will hurt the company seriously; and she will die, if she does not have sustenance shortly.'

Upon that view of the matter, some very weak gruel—with a cinder or two accidentally dropped into it—and a few slices of burned toast, were sent up to her ladyship's room.

The next day, I found my noble patient much better; invigorated by her fool, but especially invigorated by her victory in having obtained it, and by an unlooked-for success of another kind. She had detected, as she lay in her bed, with nothing to do except to watch, like Robert the Bruce, the spider-webs that began to adorn the cornices, a second bell-wire running round her apartment, and had established a communication with it by combining her own useless rope and the handle of her parasol. As I entered, unannounced—for attendance was rigidly denied her—and she had, singularly enough, no maid of her own, she was sitting up in bed, engaged in tolling solemnly at this wire, which, indeed, exceeded her most sanguine expectations, for with every jerk she gave, she rang the alarm-bell. It was placed at the top of the house, so not easily accessible, and the wire, which pervaded the hotel, being of too great importance to be cut, she was mistress of the situation.

'I have been tolling,' observed she with satisfaction, 'ever since daybreak, as though for morning-prayers.'

The Lady Letitia was only at last induced to pay her bill by a pious fraud. She was informed that one of the directors of the company had offered to take the risk on his shoulders, and understanding thereby that she could annoy her foe, the manager, no longer by stopping, but would rather benefit him than otherwise, she left the hotel immediately, although in a very unfit state to be moved.

When she recovered, she wrote me a pretty little note, with a coronet on the top of it, expressing her grateful sense of my attentions; my services had been, she was good enough to say, above all price, but she should nevertheless decline to pay me anything, upon principle. According to law, she had been led to understand that a medical man could not exact remuneration for the performance of his duties: she might be right or she might be wrong; but at all events she preferred, she said, to have the matter tried in court, before running into any unnecessary expense.

SCHOOLING IN INDIA.

At a time like this, when our armies are struggling against terrible odds in one of the fiercest contests that ever shook India to its centre, it is by no means out of place to inquire more closely than we have been wont to do, into the actual condition of that country and its people; and as a means of doing so, we cannot turn our attention to a more fitting subject than their schools.

From official inquiries into the state of education amongst the masses of the population of the Bengal presidency, it would appear that in five districts in which the state of indigenous education is most favourable as compared with other divisions, the proportion of adults who have received any degree of instruction is 6 per cent. of the entire population, so that there remain ninety-four persons in every hundred wholly destitute of education. In the least favoured districts, the proportion is above two edu-

The entire population of this presidency—that is, of Upper and Lower Bengal—may be taken at thirty-eight millions, of which above fourteen millions may be set down as children, and of these we may fairly assume two-thirds to be of an instructible age, seeing that in India children mostly commence school when five years old. Now, inasmuch as the data collected on this subject show that of the children of an instructible age only 7 per cent. receive any kind or amount of education, it follows that there are upwards of nine millions of children throughout Upper and Lower Bengal alone of an age to receive instruction, yet totally without it. Taking in the same way the adult population of twenty-four millions, and deducting from these the proportion of educated persons—namely, 5 per cent.—we find there remain nearly twenty-three millions of the adult population entirely without instruction.

Such being the state of native education in this one division of the Indian empire, it would not be very difficult to arrive at a tolerably accurate conclusion as to the total number of individuals, adult and juvenile, of the entire population of British India wholly devoid of any instruction whatever. We do not believe that on a general average there would be found above four per cent. of the entire population able to read or write in the smallest degree, seeing that the whole of the female population—with the exception of the nautch-girls—are altogether and habitually left without any attempt at education. This being the case, the result would be, that there are in the Indian territories of Great Britain not fewer than one hundred and thirty-four millions of totally uneducated persons! A fearful amount of uncounteracted ignorance, superstition, and vice in the hands of the fanatic priesthood and the evil-minded chieftains, to work upon to their own bad ends.

The extent of private tuition among the Mussulmans or Hindoos is very small indeed, if we except the chief cities of Calcutta, Bombay, and Madras, where of late years a few of the leading natives have availed themselves of private instruction for their children, both male and female. The public educational establishments of the Mofussil of indigenous growth may be divided into the common vernacular schools, and schools partaking more of the character of colleges. In these latter, Persian, Arabic, and Sanscrit are taught; seldom the three in any one establishment, but usually the schools are either Persian, Arabic, or Sanscrit.

The teachers of these are mostly of the Brahmanical caste, many living in extreme poverty, and supported mainly by presents of money and food. The scholars consist of boarders and day-pupils, who, in exchange for the learning imparted, supply their instructors with the daily necessities of life, and also perform for them many little household duties. The age at which pupils attend these institutions ranges between eight and twenty, though there are some who remain to their twenty-second year. The instruction imparted consists of general literature, rhetoric, law, logic, medicine, and astrology.

In these high-class schools, the income in money of the pundits, or professors, varies very much, ranging, indeed, from the merest pittance to a very liberal amount. It has been stated that the average monthly income of three hundred of these learned instructors

is not less than L.6, 10s.; but the correctness of the figures may very well be doubted, as this class of men are extremely tenacious of giving information concerning their mode of living, property, &c. If, however, we assume this amount to be about correct, it shews that the cost of educating the pupils of these establishments is extremely high, far beyond the real value of the learning imparted, for the average number of students at each college does not often exceed seven.

If, however, we inquire into the *quality* as well as the cost of the education taught by these Brahmanical pundits, we shall assuredly arrive at the conclusion, that they do little enough to elevate the character or improve the condition of the people. There is, indeed, no lack of indigenous literature in India. A late official return went to shew that during the last fifty years, there had been not less than five hundred and fifteen persons engaged in literary publications in Bengal.* The same document tells us that in the year 1853-4, there were two hundred and fifty works in the native languages published in the city of Calcutta alone.

The works on grammar, logic, and law may pass without much comment; but the absurdly fabulous and disgustingly immoral recitals contained in nearly all their most popular dramas, poems, and histories, leave little room for surprise that the people for whose edification these are published should prove false, base, and cruel to the last degree.

The schools of medicine are less hurtful, though the little of really practical knowledge they inculcate is so blended with absurd quackeries and strange fallacies, as to excite our pity. In those colleges where astrology, mythology, and philosophy are taught, we find the wildest fantasies, the greatest infidelity, and the grossest licentiousness mixed up with the daily teachings. Truly has it been said in one of the government reports on indigenous education in Bengal and Behar, that the followers of these schools of philosophy are intemperate and licentious in their habits and manners, not only believing that intoxicating liquors, and other vicious indulgences, are permitted, but that they are enjoined by the system they profess.

If such be the system and the *morals* of the higher class of native schools, what shall we find prevailing among the hundreds of village schools and inferior institutions of towns, the teachers of which receive emoluments in the shape of fees, and present of money to the monthly value of from two shillings to two pounds, with an uncertain addition of donations of rice, fruit, fish, &c. It would be well if we could flatter ourselves that these schools were no worse than a negative evil—that they simply effected no good. It can scarcely be said that the acquisition of reading and writing is an advantage, as the adepts employ their powers to little good purpose, more frequently for evil ends. The instruction in these schools, beyond the mere forming and deciphering characters, is of the loosest and grossest description—a mere learning by rote without any attempt at instruction.

The course in these seminaries is to place the young scholar during a month after his first entrance to practise the formation of the alphabet, which he does by writing on the loose sandy floor of the schoolroom with one of his fingers or a small stick. From this initiatory stage he is promoted to the next class, where he is taught to construct words and short sentences by writing on a palm-leaf with an iron style. Thence he proceeds to use the finer leaf of the plantain; and finally, when well advanced, he is

* *Returns Relating to Native Printing-presses and Publications in Bengal.* 1855.

taught to write on paper hardened by the juice of the tamarind-tree, and to draw up petitions, business documents, accounts, &c. In some of the Hindi, though not in the Bengali schools, a wooden board or a brass plate smeared over with mud, or chalk and water, is employed for tracing words by means of a wooden style, as well as for calculations in arithmetic.

It would be difficult to picture anything more miserable than the lot of the ordinary teacher in a native school, or more wretched than the localities usually selected for their operations. So poor, indeed, are the majority of them, that they most frequently add to their professional duties the occupation of accountants to bazaar-keepers, letter-writers, compilers of almanacs, petition-drawers, and such-like work—anything, in short, by which their pens may add to their scanty means.

The village school will frequently be held in an open shed, occasionally in the covered place in which the weekly market is held, on which day a holiday is given to the scholars, and the pedagogue occupies himself in the busy duties of what, in Europe, we should call the 'clerk of the market.'

In the common schools now under notice, the language employed for instruction is Bengali in Bengal Proper, and Hindostani in Behar and other districts; and not only is this the case with the Hindoo population, but the same rule applies to the Mussulman schools of these districts; for although the Hindostani is the common *spoken* language of the better classes of Mussulmans in Bengal and Behar, it is never employed as the means of instruction in their schools. The *Urdu* language, again, is far more poetic, and much richer in variety and force of expression, as it is also more polished, and is the language employed in the pulpit, and in popular tales and poetry; yet it has never found its way into any of the class-books of the schools, where it might be employed to the utmost advantage.

The number of Mussulman teachers, even where Mussulman scholars are taught, are very few. By far the majority of instructors in these schools are of the 'writer caste,' though the number of Brahmans engaged in teaching is also large, contrary as it is to the custom of their caste, by which it is considered degrading to give instruction in any but the higher branches of learning.

As regards the classes or castes of the pupils of these schools, the Brahmans are invariably in the preponderance; next to whom, following pretty closely, is the writer caste, the weaver and other castes keeping at a tolerably respectful distance. Twenty years ago, it was rare indeed that the least degree of instruction was enjoyed by any of the lower castes of tailors, water-drawers, sweepers, or such like; but in the present day we behold learning fully established as a republic of letters, much to the disgust and indignation of the proud high-caste Brahman, who grows up impressed with the utmost abhorrence of all innovation—a true conservative of the old school.

Such domestic instruction as is imparted in families is of a still more unsatisfactory character than that taught in the elementary schools. It is indeed little more than a handing down from father to son a knowledge of the mere rudiments of education sufficient to enable the latter to follow in the footsteps of his parent. Pride of family frequently prevents wealthy or high-born men from sending their sons to any school that may exist in their neighbourhood; sometimes, too, it is poverty which compels the home instruction of the zemindar, the trader, the headman, &c.

Such, then, is a brief outline of the state of indigenous education in Bengal; and having taken this view of it, we may render the picture more complete

of the Europeans in the same part of the country. Missionaries from nearly every society in Europe are to be found, or *were* to be met with before the late rebellion, in almost every province of India. Wherever these unwearying toilers for the truth located themselves, they formed the nucleus of a school generally for instruction in the vernacular. Contrary to the fact in the indigenous schools of the country, their pupils were mostly of the lowest castes; hence naturally the Brahmans and other caste-proud men viewed the missionaries and their labours with jealousy and hatred. All the opposition they could give to missionary preaching and missionary teaching they did give, and in no sparing measure.

The progress made by these schools, although in some instances sufficiently encouraging, has been, on the whole, extremely limited, not only from many opposing causes, but also from a want of qualified teachers, and a great dearth of school-books in the vernacular. It was not until within the last few years that the labours of the Rev. J. Long and others placed within the reach of Christian teachers useful works in the vernacular of an unobjectionable character. The instruction imparted at these establishments is of an entirely elementary nature, but thoroughly sound, and calculated to fit the pupils in after-life for some useful and profitable career.

The educational department of the Bengal government is of comparatively recent origin. It is composed of a director of public instruction, a secretary, a staff of inspectors for the various districts, and a large number of trained teachers in every branch of education. There are professors, too, for the various government colleges, and altogether a very formidable array of workers in the field.

But although the official labours of the government staff are directed towards such private and missionary schools as apply for 'grants in aid,' they are mainly employed in supervising their own establishments. It is to be regretted that the annual reports of this department are so utterly meagre and barren of all practical details as to render them valueless for our present purpose. By far the greater portion of the annual votes for education are expended in the liberal salaries of the director-general and his staff, whilst the sum left for the real workers—the teachers and other subordinates—is insignificant in the extreme compared with the amount of work to be done.

In Calcutta, there are the Presidency, the Hindoo, the Engineering, and other colleges, where professors hold their classes with all the form, and some of the effect, of similar institutions in Europe. At these, as well as at the Hoogly, Dacca, and the other Mofussil colleges, the principal classes are composed of high-caste and well-born Hindoos; indeed, the number of those from poorer sections of native society is very small. The proficiency attained by the students of these colleges, as well as by those of the medical college, is such as would be encouraging were it enduring, or did it produce fruit of any useful kind. Unfortunately, however, the most that our present system of teaching effects is to overthrow the old superstitions of the land, without replacing them with any better faith, proselytism being a forbidden thing in the Company's colleges, punishable with instant dismissal, so careful are the authorities to avoid any appearance of offending the prejudices of the natives.

To those who inquire the reason why our college education should prove of so little use to the students in after-life, we reply that it is *caste* which prevents them availing themselves of much of their knowledge. The Brahmans and the writer caste can engage in but a few occupations. To step beyond that social limit, to break through the old bounds, and engage in any handicraft, or art or calling in which the hands would

penalties of Hindoo fanaticism and bigotry—a consequence which, as yet, but one or two of the rising generation have dared. Until *caste*—the curse of India—be trampled under foot, we can do but little for the country or the people.

BURIED ALIVE.

It was on a bleak afternoon in the beginning of last March that we stood at the drawing-room windows of our house in the village of Bout du Monde, in Savoy, watching the clouds careering wildly over the sky, and speculating whether *M. le Curé* and *Mademoiselle*, his sister, would come to tea. The huge mountains opposite began to look ghastly as the bright rosy reflections from the setting sun faded from their snow-covered summits; the pine-trees in our garden creaked and swayed like the masts of a tempest-tossed ship; and as the sighing, moaning, whistling wind lulled for a second, there fell some heavy flakes of snow.

'Close the *jalousies*, Annette, and draw the curtains.' Poor miserable things these last were—thin muslin with a red cotton border. The fire blazed and crackled merrily as our fair-haired *Jessie* threw on log after log; our moderator-lamp shone like a small sun, lighting up even the most distant of the atrocious engravings of 'Passages in the Lives of *Diane de Poitiers* and *Jeanne d'Arc*,' which covered one of our walls; while on the other bloomed twin samplers, dedicated to *Un Père Chéri*, and *Une Mère Chérie*, and on which were embroidered wreaths of heartsease and forget-me-nots, each surmounted by a dove carrying a large O in its beak—undoubtedly crowns for the heads of the cherished father and mother. *Pussy* lay curled up in his basket on the rug, pretending to sleep, but keenly alive to all that was going on at the tea-table.

We were determined in the most Christian spirit to shew the curé and his sister how much more comfortable we English were than our Savoyard neighbours. So the finest of our table-linen, the best of our china, were brought out for the occasion; a profusion of tea-cakes and preserves loaded the table; while coffee-pot and tea-pot had been so well polished they might have been mistaken for silver. The mention of them is premature, as they were only to appear at the last moment. We were not quite so bad as the lady 'who loved to sit in a snug room and think of the poor wretches at sea;' but we all certainly did peculiarly enjoy, on this stormy evening, the air of comfort which the inviting, soft-cushioned easy-chairs, the thick carpet, and well-spread board, lit up by the warm fire-glow, gave to our country quarters.

'Here he is!' we exclaimed, as we heard the curé's voice calling through the kitchen window to Annette to go and open the garden gate. One side of the house faced the high road.

'*La petite fille* is actually come with him,' cried *Jessie*, running back from the door, where she had been to take observations. This was unusual, the one generally following the other at a short interval, for our curé did not like to be seen walking with a woman, even though that woman might be his sister. In they came, speckled with snow, but with cheery gleaming faces.

M. le Curé was a thin flat man, so flat that he looked like a deal-plank dressed up in a priest's long coat, a garment which closely resembles an old-fashioned scanty lady's pelisse, buttoning all the way up the middle. He always wore his best fringed sash and newest *tricorne* when he paid us a visit. He had a small wizened face, in which twinkled a pair of waggish gray eyes, their lively expression heightened by a decidedly turned-up nose. It was worth some-

thing to hear him preach, particularly when he addressed his parishioners on the subject of the cholera. '*Pardonnez moi, mes chers frères*' (a long pause)—'*passsez moi l'expression, s'il vous plaît*'—with emphasis and the pout of a spoiled child—'*mais, vous êtes des pourceaux de vrais pourceaux*'—in a tone embracing two octaves. Another effective pause, and then a rapid very clear explanation of the peculiar habits of de '*vrais pourceaux*.'

He was so sociable, so full of dry humour, and, withal, delighted so much in our family circle, that we never failed to remark, after one of his long visits, 'What can have induced that man to become a priest?—to shut himself out from all the tender charities of domestic life, formed, too, as he is to enjoy them, as witness his devotion to *la Petite*.' This *petite*, as he always called his sister, and as she always called herself, was a woman quite six feet high, as thin as mortal living frame can be, and with the longest hands and feet I think I ever saw. She was very like, yet very unlike her brother. Instead of a cocked nose, she had a majestic aquiline; instead of small, merry eyes, very large, melancholy ones; nevertheless, there was the mysterious likeness of children of the same parents between them. The hair of both was equally gray, but we were always given to understand that *la Petite* was many years younger than the curé. To hear him talk of her, you were led to conclude that she was a sort of *St Thérèse*, mystical and meditative, never so happy as when poring over what she called her '*Grenade*'—some great canon of a theologian of the middle ages—her *beau-ideal* of a saint being *Ignatius Loyola*. One day we lost mademoiselle *Les Voleurs de Londres*, the French name for *Olivier Twist*. The curé brought it back very soon. 'O no! *la Petite* could not read such a book;' and, to *Jessie's* horror, he gave it as his opinion that ce petit drôle d'Olivier ought to have been hanged!

To listen to *la Petite's* own account of herself, you might be pardoned for believing her without religion of any kind—unless we call adoration of her brother one. She would demur even to this when we observed on their strong mutual affection.

'Yea,' she would answer, 'I love him, and he loves me; notwithstanding, we sometimes bang the door at one another: it never goes further. Our curé is a man with a head, I can tell you.'

By dint of entreaty and some gentle force, we at last settled mademoiselle in one of the large chairs by the fire, with her feet on a footstool.

'*Une si petite fille comme moi*,' she expostulated, stretching out her lengthy limbs, and basking in the genial glow. Then began the ceremony of coffee-drinking; the Savoyards are very Turks in their love of coffee.

'Ah, *Mees Jessie*, you know the weakness of us curés,' said *M. B.*—, as she filled his cup to the brim with sugar.

'Give our curé his coffee, and he is happy,' remarked *la Petite*: 'coffee is his religion.'

This was only one of our *St Thérèse's* usual rather startling observations about her brother.

'Very true,' said the brother demurely. 'I did not get my mid-day cup of coffee last Sunday; and I assure you, madame, I could think of nothing else through the whole of vespers. A cup of coffee haunted me,' and his little eyes twinkled.

'Oh, *Monsieur le Curé*!' cried *Jessie* suddenly, 'how did you ever come to be a priest?'

He coloured a little, hesitated, and then said: 'Well, I will tell you; and no more seasonable time than the present, as this happens to be the eve of the anniversary of the great peril which decided my vocation.'

Jessie was too much abashed by her own thoughtless-

speech even to say 'Thank you;' but the curé, soon recovering his usual manner, ensconced himself in a great leather chair in front of the fire, with our dear pussy, whom he always insulted by calling 'un gros matou,' at his feet. As soon as he heard the click of his sister's knitting-needles, he gave us a look just like the one he bestowed on his congregation before beginning his sermon; and when we were all quiet, he commenced his story.

In the autumn of 1828, just thirty-five years ago, my sister and I went to pay a visit to an aunt, married to a wealthy wood-merchant of Bellinzona. I was then eighteen, and la Petite some years younger. Our uncle and aunt, who had no children, grew very fond of us, and would not hear of our leaving them; they talked of adopting the little one, and of taking me into the wood-business. We on our part were willing enough to stay with them; for never before had we known so much comfort, our parents being rich in nothing but sons and daughters. The winter of 1823-4 was more than usually severe; the snow lay deep in the valley; all the small streams were frozen, so no saw-mills could work. Our uncle grumbled and smoked, and smoked and grumbled, from morning till night. He had several large orders, and he was uneasy at the delay he was forced to make in executing them. You must know that the wood is felled in summer, but not removed till winter, when, by means of long slides, formed of rough trunks of trees, on which water is poured to procure a coating of ice, the timber is conveyed to the foot of the mountain. Now, that winter not one among the stoutest-hearted of the Burratori—the men are so called who cut and bring the wood to the lake—would venture up to the forests. There was nothing for it but to wait till the cold moderated. But February, with its wild bleak days came, and passed, and still the men refused to work. At last some warm sunny days ushered in the month of March. The snow left the valley, and the icy fetters of the merry streams melted quite away. The sunshine without brought us sunshine within; my aunt's husband now whistled about the house, making each of his fingers go off in small reports as a sort of *feu de joie*. Seven Burratori had agreed to go up the mountain. As during the last three weeks there had been neither a fresh fall of snow, nor any indication of a thaw, the weather-wise declared no danger was to be apprehended. In fact, the mountain, from its nature, was little subject to avalanches, nor had any worth speaking of occurred within the memory of man.

Tired out by such long inactivity, I was wild to join the intended expedition, and at last wearied my uncle into granting me permission to begin my apprenticeship at once. I was put under the care of an old fellow called Picurio, generally recognised as the chief of the Burratori. We were to set out on the Monday morning, and it was hoped the job would be completed by the following Saturday.

We had, however, forgotten to ask la Petite's consent. She, who had never been separated from me even for a day since her birth, was in tears from morning till night at the idea of my leaving her for a whole week. My uncle was, in truth, a soft-hearted man, so he agreed to go with us himself, and take the little girl also as far as Aquila, a village in the Val Blegno, lying at the base of the mountain to which we were bound. This arrangement put an end to my sister's tears; though, as the Burratori stop out night and day till the work is finished, she would see as little of me as if she had remained at Bellinzona. We were well provided with woollen wrappers and the means of kindling a fire; and as you may believe, the thought of this boudoir had infinite charms for my imagination.

The cold on that memorable Monday morning was perhaps as intense as it had been during the winter; but as there was no wind, the men kept to their engagement. I cannot affirm that sleeping under a rock was as delightful in reality as in anticipation; still, I relished being treated as a man, and never complained. On the Wednesday, old Picurio declared it was beginning to thaw, and on Thursday it was perfectly clear that the frost had broken up; indeed, we heard the snow slipping down the grooves cut in the mountain's side by the spring and summer torrents. The Burratori did not seem to care, for the pine-trees prevented any dangerous accumulation of snow in our immediate vicinity. Our only danger lay in going to and from the forest, our night's shelter being in the natural caves formed by projecting rocks, which, as a matter of course, were on that part of the mountain where there was no wood. We strained every nerve to finish our task on Friday evening.

'Three or four hours more would have done it,' said Picurio in a desponding tone, as darkness overtook us, and a large stack of timber still lay before us.

'Well, then, let us be up by peep of day,' cried I, 'and we may all be back at Bellinzona by the evening.'

On the morrow, we only mustered five; three of our party were missing. Had they deserted, or only gone on in advance?

'We shall soon know,' said the remaining Burratori, and with one accord they sent forth such wild, unearthly yells, ending in shrill peals of mad laughter, that, though I had heard of their mode of holding communication with their comrades at a distance, I was nevertheless disagreeably startled. These yells can be heard an incredibly long way off. When there could be no reasonable doubt that the missing men had deserted us, many were the smothered exclamations of 'Oibò gatto di marmo' ('cat of marble' meaning lazy fellow), 'you shall pay for this.'

The loss dispirited us, for the work still to be done required all our original strength of hands to get it finished in the time proposed. The dawn was just whitening the horizon when we began our ascent, and a little breeze, barely enough to make the pine-branches quiver, was blowing from the west. Picurio's only son, a stout, handsome young man, the wag of our party, prophesied we should have a fine day; but as the light increased, great black masses of clouds came up from the south-west.

'A bad sign, I say,' cried Picurio; 'we had better turn back.'

I was somewhat vexed at this advice, and answered hastily: 'Those who are afraid, may go back; I shall keep my promise to my uncle, if I send down the rest of the wood unassisted,' and I walked on; the rest followed, but in silence.

Our path up the mountain, now winding in and out through pines, now passing under steep, bare rocks perforated with caverns, ran along the edge of a ravine several hundred feet deep, at the bottom of which lay, silenced under a huge snow-drift, one of the great mountain-streams which in summer could be heard miles away, as it dashed and roared in its precipitous descent to join and swell the wide Ticino. Far above, as high as we could see, were mountaintops bristling with spears of sea-green ice, which, as I gazed, were gilded by the rays of the rising sun.

'Look!' cried I, 'is not that the promise of a fine day?'

Old Picurio shook his head as before, for at the instant a pale, watery sun, encircled by a ring of vapour, shot into view. In another moment it was entirely obscured by the clouds which speedily covered the whole sky. The sighing breeze suddenly grew into a turbulent wind, and some prickling sleet fell.

The men stood still, looking uneasily about them,

muttering between their teeth: 'Ah! *vacca d'on van' mostro!*' (Caw of a monstrous wind!)

'I told you so,' cried Picurio; 'those clouds are a sign of evil. Let us go back—we have no time to lose. The holy Virgin protect us from an avalanche!' 'Nonsense, father!' replied the son; 'you know there are never avalanches on this mountain.'

'Don't say so, my son; I remember hearing my father speak of a terrible one.'

'As big as my hand,' answered the young man laughing.

Nevertheless, the old man's words had produced an effect; for, as if with one accord, we all turned round and began to descend towards the village. The wind would cease as if by magic, then come rushing from every quarter of the heavens 'a mighty and a strong wind;' the sleet changed to thick fast-falling snow, which, whirling in mad eddies, and flying up and down, almost blinded us. We walked as quickly as we could, following Picurio, who had assumed the lead; but what with the teasing of the wind, and the slipperiness of the path, we could scarcely keep our feet. After one blast, which nearly hurled us down the ravine, we joined arms, and kept as close together as we could. Not a word was spoken; for by this time the bravest heart amongst us quaked with fear, and many an anxious glance was cast around in search of any signs of the dreaded disaster.

We had reached a point about half-way down the mountain, where the path passed through a mere cleft between two rocks. Here we were forced to go two by two. At that instant, a boom like that of a distant waterfall struck on our ears. We stopped, raised our eyes in terror, and saw, right above us, a large white mass like a living thing, rise slowly with a convulsive heave from the edge of a rock, hover for a second, topple, then come crashing down.

'The avalanche! the avalanche!' burst from every lip. 'To the left, to the caves,' shouted Picurio, dragging me along with him. In the twinkling of an eye down fell the enormous white mass in front of our refuge; there, we were unhurt, but shut in between a wall of rock behind, a wall of ice in front.

After the first moment of bewilderment, Picurio cried out: 'Who is here besides me?' It was pitchy dark—no seeing even one's own hand.

Mine was the only voice that replied.

'My son! my son!' exclaimed the old man; 'oh, that I had died for thee, my son;' and I heard him weeping. Awful were those moments. Buried alive—a father's agony the only sign of life breaking the stillness and darkness of the grave. Often in the silent watches of the night do I hear again that voice of woe—often in dreams I live over again that terrible scene.

'Have you your axe, young man?' said Picurio.

No. In the perilous moment when he had forced me under the rock, the axe had slipped out of my hand.

With all the energy of despair, we flung the whole weight of our bodies against the inert mass which shut us into our living tomb—hopeless—hopeless. I must have then fallen into a lethargy; for the avalanche fell in the early morning, and the Ave Maria was ringing when I recovered my consciousness. Yes, we distinctly heard the bell of the church of Aquila. No words can describe the rapture I felt in listening to this voice from without; it seemed to say distinctly: 'Hope in God's mercy.'

'Let us pray,' said the old man. We recited the Angelus, and told the rosary. After that we felt more composed, and sat down side by side. The sound of the church-bells had taken away the horrible feeling of being entirely cut off from the living. We felt sure that, as soon as we were missed, all the village would turn out on the morrow to seek for us;

and we agreed that, as we were able to hear the bells so clearly, it would not be difficult to make ourselves heard by any passers. Luckily, our day's food was in our pockets; we divided it into several portions, so that it should last twenty-four hours. Within that period we never doubted obtaining our release.

Presently the church-bell began to ring again. It could not be the *De Profundis*; sufficient time had not elapsed; besides, the strokes were quick and sharp, not slow and solemn. Glory be to God, it was the storm-bell; the alarm was given, and good souls would soon be on the search for us. Neither Picurio nor I spoke, so eagerly did we strain our ears to catch the sound of approaching steps, long before it was possible that any one could have reached the mountain. I think the beating of our hearts might have been heard in that dead silence.

At last, at last we distinguished the barking of a dog. I recognised the bark at once: it was *Lila*, the *Petite's* pet. Nearer and nearer it came, until we could hear him whining and scratching the snow which hid us. Then the blessed sound of human voices became audible. Full of hope and joy, we threw ourselves once more against our snow-barricade; we dug at it with hands and nails, striving to open a crevice through which we might let our friends know our situation. We shouted with all our might, but the noise fell back heavily on our own ears. Many times we were aware that the seekers were close to us—we heard them calling to one another. We could hear, but with anguish we understood that we could not make ourselves heard. Near as the searches were, we could hold no communication with them. Exclamations of horror, pity, and grief, met our ears. The names of our unfortunate comrades were pronounced in tones that plainly revealed their sad fate. There was a bustle, many directions of how best to carry away the bodies, wonder about us, and then the expected deliverers departed. A horrible despair took possession of me as their retreating steps grew fainter and fainter; but poor Picurio always cried: 'Let us pray; God's right arm is long enough to reach us even here.'

I tried to pray, but my thoughts wandered to my home; all the childish griefs I had known were forgotten, and I wept bitter salt tears to think I should never see father or mother, brothers or sisters again; all my faults to them rose up in judgment against me; how solemnly I vowed that should God grant me life, I would never again rebel against the will of my parents! And *la Petite*, what would she do without me? I was sure she would die of grief. As the night wore on, my thoughts took another turn—the whole scene of my own death, the finding of my frozen body, the despair of my poor little sister, were moving pictures before me. I could not detach my eyes from the phantoms it had evoked. It was painfully curious the way in which I arranged and re-arranged all the details, sparing myself no revolting minutiae. I suppose I must at last have dropped asleep, for I knew nothing more till Picurio called to me that he heard the bell for early mass. I raised myself on a sitting-posture, and we each ate a portion of our bread. All that day and the ensuing night passed in alternations of hope and despair. By the next morning—the beginning of the third day since our entombment—our little provision of food was exhausted. We were oppressed by feverish thirst and gnawing hunger—a horrid death was before us, the fate of those who had perished at once was to be envied in comparison with the lingering suffering we anticipated.

We had ceased to speak, ceased to pray; I had no hope now—no faith. In moody silence we sat apart, watching, I may say, the approach of the pang of death, when suddenly the deep hush was broken by a

familiar sharp bark. It was Bibi again! Oh, the unutterable joy of hearing the little fellow tearing and scratching at the snow blocking up our cave! There was another sound that made hot tears rain down my cheeks; it was a child's voice—no other than la Petite's—crying: 'He is here, uncle. I am sure he is here. Oh, dig, good men, dig fast!'

Our hearts melted within us as we heard many steps nearing our prison. There was danger, too, for many cautions were given. The child's voice still rose clear above all: 'Make haste; do make haste. Give me a hoe; I can dig. My poor brother will be dead, if you don't make haste.'

At last a long stick was pushed through the snow-wall; it touched me; I seized it. There was a shout of 'A miracle! a miracle!' mingled with the child's wild cry of 'Brother! brother!' Another stick was thrust through and caught by Picurio. Not a whisper was now to be heard; every one worked; minutes seemed hours to us before an opening was made large enough to drag us through.

When we once more saw daylight and dear familiar faces, we fell down fainting with joy. We were lifted out and laid at the feet of the old curé, who, in spite of age and infirmities, had ventured up the mountain to bless and encourage the efforts of the men who, touched by the child's agony of grief, had consented to make one more search for us.

'Thank God, my sons, for your deliverance,' were the old priest's first words, 'and devote to His service the lives He has so miraculously preserved.'

'It was this, Mees Jessie, that led me to become a priest; and la Petite, who, through God's mercy, saved my life, has made my home her home.'

'She would have made a capital lady-abbess, though,' said M. B——, looking at her with unfeigned pride.

'And old Picurio?' asked Jessie.

'He died in my uncle's house.'

THE CUMBERLAND STATESMAN.

'The fashion of this world passeth away.' It was so in Paul's days, nor has the world's fashion grown more stable since. It is, however, only 'the fashion' that is so unenduring; the substance of the world's life is much the same it ever has been since the days of man's pilgrimage were reduced to threescore years and ten. There is eating and drinking, and marrying and giving in marriage, and deaths and funerals; while it is still true, according to the proverb, the 'one half the world does not know how the other lives.' Yet 'the fashion' passes away, and seems to be more fleeting in our days than it ever was in the old time before us. Science and art have sent a mighty flood swoop against, through, and over all our ancient ways of doing, so that the tone and aspect of life has been in a great measure altered. The son is no longer like his father; the young lord is no longer a continuation of the old lord. The fashion of dress passes downwards from class to class, till it vanishes utterly among the clouts on the back of the beggar.

Change has so infected England, that there is scarcely a corner uninfluenced by it. Old-fashioned folk are all dying off: even the Cumberland farmer is becoming an altered man; so much so, that we are fain to trace some lineaments of his old wrinkled face before he drop into the grave, and be wholly forgotten. Our hero is one of those farmers or 'statesmen' who dwell in some one or other of the dales among the Cumberland and Westmoreland mountains. They are a class of men, in many instances, boasting a very ancient pedigree; perhaps we should not say that they boast of this, for they are hardly conscious thereof, further than to know that time out of mind they have been at the same place—the Alisons o' t' How, the Jopsons o' t' Hollows, or the Wrens o' t' Langhwaite. Thus

have they lived on from generation to generation—tillers of the ground, and keepers of sheep; a hardy, long-lived race, fed and clothed out of their own produce; men mighty to struggle with the storm on the mountains, lovers of cur-dogs, and with here and there a tradition of some forefather lost in a snow-storm, or drowned coming from market. They are a people who reckon not by days, and months, and years, so much as by fasts and festivals, fairs and merry-makings, great battles, and the times of great men. For the last two they are especially notable: you may hear them date a very ordinary event by the battle of Trafalgar, or Waterloo, or the days of Pitt, or any other prominent man of the time; and in this they shew forth the old Norse love of war and heroes, which still animates the hearts of their pastoral descendants.

There was once in all the dales one 'statesman' who bore the title of king—a title which was hereditary, having first been gained, doubtless, by the family's superior wealth in sheep and kine, coupled with a liberal spirit of hospitality. It was a bare title, however, conferring no vested rights, but withal some honour and parochial consequence. For instance, his majesty usually sat at the head of the table on all public merry-makings, his voice carried somewhat of a princely weight with it in all disputes between neighbour and neighbour, and when he died, his funeral had the largest attendance, and there was the greatest abundance of cheese and bread and ale. So exclusively was this title confined to one family, that no other was ever known to usurp it, no matter how rich in lands and tenements; and, in one instance, we have known it still given to the lawful heir, though he himself was a most sorry fellow, and without a foot of land beyond the measure of his last bed in 'the chapel garth.'

These dale-kings are now nearly extinct; their descendants lost in the common population, and their lands passed into other hands. The dalemen like to do all things of a special concern after a substantial fashion. They christen, marry, and bury one another in a right English style of hospitality. When an old 'statesman puts up his feet,' as they say of one who dies, two from every house in all the dale are warned to the funeral; and it is the honour of a house to have it said, that there was plenty of everything on the occasion, and that the old man was 'put by decent.' They would count it an ill start in life for any child to be christened without a goodly gathering of friends and neighbours to witness the ceremony, and partake of their hospitality; but it is at a wedding where you best see this characteristic of the dalemen. There are no marriages solemnised in the little chapel in the valley, and so they must needs go to the mother-church—in some instances a distance of eight or nine miles. It was their custom to start early in the morning, all on horseback, to the number of fifteen or twenty, and one horse bearing double 'with pillion,' whereon the bride and bridegroom returned from church. It must have been a fair sight on a bright summer morning, when the shadows of the rocks were lying cool upon the vale, to have seen the cavalcade ambling down through the defile of the mountains, and by the shore of the blue lake. On their return, there would not be so much order, the spirits of the men being exalted with ale; and you might often have witnessed very furious riding, for it was counted an honour to be first home from the kirk. In this substantial fashion the old farmer christened and married his children, and so gave them a cheerful start in life.

Let us take a view of the old farmhouse. It is a low, irregular building, the roof thereof being covered with moss, very modest in pretensions, and, indeed, giving but little outward token of its inward

comfort and hospitality. Its front duly in spring-time receives a fresh coating of whitewash, and very bonnily, on a summer-day, does it gleam from beneath the full foliage of its guardian sycamores. Adjoining it are placed the stable and *laidak* or barn, the cow-house, and other farm-buildings. But let us enter the old man's dwelling-place. The door is low, so you must beware of breaking your head. This little porch which first receives us is both a comfort and ornament to the house. There is a low stone vessel on either side, whereon you may see in the morning the clean scoured milk-pails placed to dry. In one corner there are three or four shepherd's staves, or 'felt sticks,' as they are called, being about six feet long, and shod at one end with an iron prong. There are, moreover, hanging up in the porch two or three old gray coats, used for wet markets, Sabbaths, and fells. The room you enter from the porch is called 'the house,' wherein the family lives. It has a clean stone-floor, and before the large window that looks upon a garden, there is a long, dark, oaken table, by the side of which extend two fir-forms, to serve instead of chairs. The chimney is one of a very ancient sort, being quite open to the house, with the fire lying upon the hearth. Far up in its capacious height are hanging hams and sides of bacon, to receive the benefit of the 'peat-reek,' while upon shelves attached to the beams that support the floor over the house are cheeses, and dried legs of mutton, and bread. The farmer lives in sight of his eatables, which doubtless tends to keep his stomach in a quiet and healthy state, and, moreover, serves to set off the substance and abundance of his estate. It is common, indeed, to infer poverty or niggardliness, where this show of provision does not meet the visitor's eye; and we have heard of a servant-lad, who, on going to his 'place,' and seeing nothing in the chimney, or on the shelves, was determined to run away. He concluded, however, that home was too far to run that night, and so he must needs stay where he was. On retiring to bed, he found a large oaken chest in the room, and being curious to lift the lid, he saw therein a great abundance of hams, legs of mutton, &c., which fully satisfied him that there would be plenty to eat. The reason of the provision being put out of sight was through the housewife having been white-washing and cleaning the house against Whitsuntide, according to custom. At the far side of the house stands an old clock, which seems out of all fashion with the clocks of the present day; and on the side separating the house and parlour there is a long black oak cupboard, with the initials of the original owner, and generally dated early in the seventeenth century. We find this date upon all the old oaken furniture in the farmhouses, which seems to shew that the farmers of that time must have been somewhat prosperous, for modern furniture cannot compare with it in splendour and coarseness. On this piece of furniture you find arranged a goodly show of huge pewter dishes and plates, now wholly out of use, and kept only out of honour for the past. There is generally a tradition or two respecting this pewter—how it was hidden in the orchard when the rebels of '45 invaded England; and how, moreover, it was proposed to do the same with it when there was loud talk of Bonaparte sailing for our shores. The parlour we alluded to as separated from the house by the oak cupboard, is the statesman's bedchamber, choosing to sleep there as well for protection to the house, as to prevent his sons and servants from coming in at untimely hours of a Saturday or a Sunday night, the usual times for sweet-heating. Behind the house is the kitchen wherein the family live in summer, and in general do all their rough work.

In front of the house is a small garden, which

you enter at the side of the porch. It contains a bed or two of onions, and a few rows of cabbage, besides other vegetables, such as the housewife finds useful. Its flowers are of a sweet and simple character; and if not indigenous, yet a colony of an ancient date, as to claim a right to be counted as natives. They are such flowers and shrubs as grow in English gardens when Shakespeare lived—daisies, pinks, and polyantheses, thyme, rue, and citrons-and-wall-flowers, tulips, and roses. The rose is the especial favourite, as indeed it should be, as well for its own beauty and fragrance, as because it is the flower of England. The orchard stands generally behind or at the south end of the farmhouse. It consists of a few rods of land planted with apple-trees, a few plum and cherry trees, and in recent two pear-trees; for the farmer says that it once was 'to be hanging' for breaking an orchard, but that the law did not count it an orchard unless it contained two pear-trees. This, doubtless, has some backward reference to the days of King Alfred, for ought we know. An orchard has something in it peculiarly interesting, whether it be for the richness of its purple-tinted blossom, or its golden fruit, or its quiet sunset hours we have many of us spent then in youth. Ever since the days of Shakespeare, it has been consecrated to our English homes.

Sleeping within mine orchard,
My custom always of an afternoon,

the father of Hamlet was cut off, says the royal ghost; in an orchard, too, Romeo won his Juliet, and swears by the moon 'that tips with silver all these fruit-tree tops.'
